JOURNAL OF HORTICULTURE, COTTAGE GARDENER,

AND

HOME FARMER.

A CHRONICLE OF COUNTRY PURSUITS AND COUNTRY LIFE, INCLUDING BEE-KEEPING.

CONDUCTED BY

ROBERT HOGG, LL.D., F.L.S.

Established

in 1848.

VOLUME XI. THIRD SERIES.

JULY — DECEMBER, 1885.

LONDON :

PUBLISHED FOR THE PROPRIETOR, 171, FLEET STREET.

1886.

LONDON:
PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE,
171, FLEET STREET.

TO OUR READERS.

THE annexed index of the contents of the past twenty-six numbers of the *Journal of Horticulture* is a sufficient indication of the comprehensiveness of the work. In the variety of subjects and the manner of their treatment it is hoped the last completed volume may be worthy of its place in the long line of its predecessors, which collectively are admitted to form an encyclopædia of practical gardening such as can only be produced by long years of work by the best men of the time in which they practised.

We are particularly gratified by the fact that there has been no break in our staff of contributors during the year. The old remain with us, and their longer experience will not render their valued services less reliable, while young men of much promise have also shared with credit to themselves and satisfaction to us in the completion of the volume.

It is pleasurable to all—to writers and conductors alike—to have testimony that their efforts to provide and disseminate information are fully appreciated. We have received far more letters of approval than can possibly be published, and brief extracts from four must suffice as typical of old subscribers and new, of gardeners and amateurs:—

“My horticultural pursuits are my greatest pleasure. At my very advanced age, now upwards of eighty years, I am still able to occupy and amuse myself, and having now no head gardener as of old, I superintend everything myself with the aid of the cherished Journal!—always eagerly looked for every week. I believe I must be one of its oldest recipients of benefits. Even when abroad I had it regularly forwarded to me.”

That is the testimony of very matured experience. A newer reader, yet who has had time to form a judgment, and who has clearly not given his verdict without examining the evidence, observes:—

“I have just been re-reading the numbers of the Journal issued since January, and looking back at the year's work am better able to appreciate the value of the teaching it contains than I was as quite a beginner in horticulture last winter.”

Nor is the testimony of a gardener, who ranks amongst the most competent, less reassuring. Here it is:—

“I take this opportunity of thanking you most heartily for the very large amount of assistance I have received during the last few years through the medium of your excellent Journal. I have not one word to say in depreciation of any other similar publication, but for practical utility the *Journal of Horticulture* stands in my opinion simply unique! As such I have very strongly recommended my foreman to purchase the Journal in preference to all other gardening periodicals. I am glad to inform you he is now doing so, and is both well pleased and most ably instructed.”

Last, but not the least valued, is an amateur's testimony—a lady amateur—whose garden is her great delight. She writes:—

“How I wish more would take and study the Journal. Useful though cheaper papers may be they lack authority, while the Journal represents the highest scientific horticulturists' knowledge and the experiences of many eminent amateurs. I am more instructed by it in my small sphere and more charmed with it than ever.”

It will thus be seen that, thanks to our able coadjutors, the Journal maintains its popularity, and with their continued aid it will merit the approval of old and win the confidence of young readers, to the mutual advantage of them and ourselves. Our cordial greetings to all.

Thus an early label of the system
indication of the early history of

ABELIA CAFFRA, 338
 Abies brachyphylla, cones of, 93
 Aboricultural (English) Society, 333
 Acacia lophantha, 592
 Adiantum dolabriforme, 377
 Afghanistan, flora of, 42
 Agave americana variegata, 337
 Agriculture, lectures on, 293
 Allamandas, 593; leaves, curled, 34; on hot-water pipes, 86; planted out, 167
 Allotment cultivation, 510
 Alpine plants, 175; choice, 138; protection of, 515; culture of, 547
 Aloe Bainesi, 517
 Amaryllises, early, 525
 Amazonia pumila, 491
 American garden, Mr. Jay Gould's, 45
 Ammoniacal liquor as a manure, 551
 Ammonia — preparation for plants, 85; for vines, 101
 Anæctochilus, 132
 Anemones, Himalayan, 230; A. polyanthes, 230; Crown, 321; planting, 318; Crown in autumn, 379
 Angraecum Leonis, 192
 Annotta, 441
 Annals, 77; autumn-sown, 140
 Anthurium, Andreanum, 429; A. crystallinum, 483
 Anthriscus, 260; from seed, 103
 Ants, destroying, 57, 170
 Antwerp International Horticultural Show and Congress, 111; notable plants at, 181; reports of, 337
 Aphides, migration of, 109; increase of, 491
 Apothecaries Garden, Chelsea, 403
 Appleby Hall, 337
 Apples—export trade in, 74; Bess Pool, 79; Conference in Scotland, 204; for market, 266; Lord Suffield and Biennheim Pippin, 293; crop in America, 294; bearing on the previous year's wood, 297; lichens on trees, 307; selection of, 325; Prince Bismarck, 325; September Beauty, 325; British and foreign, 337; Show at Kensington, 345; New England crop of, 359; cutting down, 362; popular, 370; autumn, 404; early, 422; the Nanny, 435; pyramids not fruiting, 461; good varieties of, 468; from seeds, 483; Lady Sudeley, 489; culture on light soil, 509; Show at Edinburgh, 501; canker in, 567; grafting, 573; the culture of the, 589
 Apricot—Hemskirk and Moor Park, 134; insect enemies of, 249; falling under glass, 436; branches dying, 483, 491
 Aquilegia, 497
 Aristolochia gigas, 293
 Arnica montana, 19
 Artichokes—Globe, 75, 258; for alcohol in Belgium, 109; Jerusalem, 570
 Arundel Castle, 317
 Asparagus beds failing, 232
 Aster Amellus bessarabicus at Hampton Court, 315
 Auriculas—culture of, 298; Mr. Horner's lecture, 381, 3, 8, 418; Society's Meeting, 516
 Auricula election—lists of varieties, 5; opinions of voters, Alpine varieties, 17
 Au tralia, Western, as a field for emigrants, 63
 Autumn plants, showy, 272
 BALSAMS, CARTER'S STRAIN OF, 15

Baptisia australis, 93
 Barron, Mr. W., 245
 Bath Floral Fête, 230
 Bath Show, judging at the, 465; 520
 Batters Park, bedding at, 187
 Banhiula VahlII, 229
 Beans, 238; Sutton's White Czar Runner, 293; Kidney and Runner, 397; Scarlet Runner, culture, 515
 Bedding plants, propagating, 214; useful, 566
 Bees — unsealed cells, supering, 13; casting accounts, 11; killing bees in autumn, 34; bees and hives for beginners, 33; skeps versus frame hives, 55; spreading brood, outside cases, 77; sections, taking off, 78; frame-hives, 99; stinging, removing supers, 100; straw skep as supers, 101; surplus bees, skeps, 99; preserving, supers, 125; a word in season, extracting honey, 123; strengthening stocks, 124; useful hints, 146; in a Stewarton hive, 147; supers on a Stewarton hive, 149; notes on management, 168; foreign varieties of, 169; Syrian, 169; taking to empty hive, 170; supers v. sections, 170; questions in bee-keeping, 170; uniting or returning swarms, 193; frame hives and sections, 194; useful hints, 194; the Stewarton hive, uniting swarms, a bee adventure, 215; notes on, open v. close driving, 238; rearing queens, supers v. sections, 239; frame hives v. skeps, 240; ideal hive, 239; stray thoughts on, 261; theory v. practice, 261; vicious bees, 261; examination of hives—joining hives—sufficient stores—foul brood—queenless colonies—robbing, 260; profitable bee-keeping, 283; driven bees in a frame hive, 283; Stewarton hive, 282; useful hints on the Heather harvest, Syrian bees, condemned bees, young bees, 375; labour lost, 305; useful hints, 326; in Mexico, wax production, the honey market, 327; queenless hive, bee slaughter, 350; driven and fed bees for stocks, 350; the honey market, 350; marketing honey, the last chance, 349; spreading brood, 369; wasps destroying, 370; the best hive in creation, 391; Notes on, smoker, glass in supers, temperature of October, 413; skep coverings, Caledonian Apian Society, 435; square Stewarton hive, 437; general management, 459; useful hints, 459; a year's record, 460; bees and bee-keeping, 460; wax extractor, honey bottles, races of bees, 481; feeding, carbolle acid, catching swarms, 482; artificial swarms from skeps, 504; general management of bees, 505; notes on, wax extractors, production of wax, 526; honey packages, races of bees, calming bees, cottage bee-keepers, the Bligh competition, 527; frame and Stewarton hives, 528; swarming and non-swarming, 549; reversible frames, zinc floors, 550; foul brood, 571; the best hive, 594; education in bee-keeping, 593; useful hint—, 593
 Beet, Spinach, 134; 467

Begonias, Tuberous, as florist's flowers, 57; Marquis of Lotherian, Marquis of Stafford, Picotee, Prince Henry, and Thwaitesi, 93; supporting Tuberous, 100; at Rathronan House, 208; in beds, 320; Carrierel, 423; semperdorens rosea, 324; manicata and heracleifolia, 503; Royal Tuberous, Laing's, 561
 Belgian horticulturists, meeting of, 271; 338
 Berberises, 474
 Berlin, exhibition at, 20
 Berry-producing plants, 566
 Bertolonias, Van Houttei, 101; 132, 142
 Bexley Heath Nursery (Mr. Ladd), 107
 Bilberry, the, 235
 Birds, migratory, 359
 Bixa Orellana, 441
 Blackberries—256; American, 275, 293, 304; for market, 315; cut-leaved, 468
 Blithfield, 343
 Books, review of, "Wild Flowers worth Notice," "Where to find Ferns," 121; "Greenhouse and Stove Plants," 142; "Walks in Epping Forest," 182; Bible flowers, 279; flowering plants and Ferns of the Riviera, 425; Mr. Hibberd's "Golden Gate with Silver Steps," 446; Williams' "Orchid Growers' Manual," 546; Carters' Vade Mecum, 539; Illustrated Dictionary of Gardening, 581; Fruits and Fruit Trees, Home and Foreign, 591

 Bouvardias, stopping, 284, 304; culture of, 335; choice varieties, 339; root propagation of, 537
 Box, transplanting, 433
 Bracken Fern in Australia, 492
 Brazilian Hawthorn, 470
 Briars budding, 101
 Brighton Show, 238
 Bristol Chrysanthemum Society, 294
 Bristol Show, 492
 Brookham Rose Association, 8
 Brodiaea coccinea, 16
 Brodiaea ixioideis and laxa, 141
 Bromeliads, 132
 Brown, death of Mr. Samuel, 379
 Bryn Glas, 472
 Buda-Pesth, proposed international fruit show at, 317
 Bulbs for the parks, 158; preparing for forcing, 232; choice, 338; rationale of potting and planting, 437
 Bull, death of Dr. H. G., 492
 Burghley, three good things from, 337
 Burlingtonia fragrans, 470
 Burton Constable Nurseries, 280
 CABBAGES — SPRING, 38; Ellam's Early, 85; insect enemies of the, 364; Venus's Early Dwarf, Cook's Early, 450, 490, 584; insects on, 522; clubbing, 535
 Cacao and Cacaonut, 492
 Cactuses at home, 144 in America, 280

Caladiums, 259
 Callanthes, early, 168; culture of, 431; C. vestita ocnata gigantea, 446; C. porphyrea, 522, 539
 Caledonian Society, Royal, Shows, 49, 500
 Calochortis, 51
 Calla aethiopica, 304; as an aquatic, 488
 Cambridge Botanic Gardens Report, 54
 Canellias, varieties of, 350
 Cam annas, 76, 497; C. Heudersoni, 93
 Candytuft for spring, 103
 Canker in fruit trees, 376, 422, 426, 517, 523, 533, 549; in Apple trees, 567
 Cannas, wintering, 461; culture, 595
 Canterbury Rose Show, 6
 Carbonate of soda as manure, 34
 Cardiff Castle, 89
 Carnations—characteristics of, Souvenir de la Malmaison, 20, 35, 21, 181; at Chelsea, 65; best border varieties of, 83; the Governor, 95; choice varieties of, 125; at Slough, 135; sport, 148; Yellow, 195; winter flowering, 339; Tree, 338; sport from Souvenir de la Malmaison, 470; culture, 543
 Carnation, National (and Picotee) Society, funds for the, 42; Show, 95; Northern Section, 180
 Carpet beds, 77
 Caryophyllus aromaticus, 141
 Caterpillars in a garden, 306
 Cattleyas—C. Hardyana, 141; autumn treatment, 168; from Dr. Paterson, 158
 Cauliflowers, 213; varieties of, 303
 Ceanothus dentatus, 278
 Cecil Lodge, Abbot's Langley, 278
 Celery—76; earthing, 86; extensive injury of, in America, 317; White Gem, 403; White Plume, 423, 424, 443, 489, 511, 557, 557, 586; the varieties of, 485; crop in, 471; Sandringham White, special varieties, 586
 Centropogon Lucyanus, 503
 Cereals, fertilising, 240
 Cereus, the Night-blooming, at Mr. Major's, 204; Napoleonic at Kew, 294
 Chatsworth, 353
 Cheshire Floral Society, 42
 Cherries—crop in Kent, 5; house, the, 11; in pots, Rivers' Early Prolific, 115; selections of, 325
 Chertsey Show, 9
 Cheshire fruit farm, 225
 Chestnut, the, 347
 Chimonanthus fragrans, ripening seed, 403
 Chiswick Show, 67
 Chlorophyll, development of, 315
 Chou de Gilbert, 346; de Burghley, 424
 Christmas—cogitations, 553; berries in the open air, 568
 Chrysanthemums—history of, 2, 60, 104, 130, 159, 205, 359; dis-budding, 34, 122; Mdlle. Melanie Fabre, 20; show in May, 42; for exhibition, 56; stem and root cuttings, 53; synonymous, 61; for exhibition, 79; raising seedlings, 104; late propagating, 122; sports, 131; insects on, 148; house for, 148; setting buds, 171; dis-budding, 214; top-dressing, 216; exhibiting, 245; early flowering, 267; notes on, 279; prospects in the north, exhibiting, 279; at the Middle Temple, 291; best method of staging, 298;
 at Camberwell, 293; manure for, 298; late varieties, 298; travelling box for, 301; insects on, 306; and American aphids, retarding, 328; earwigs on, 329, 361; Madame Desgrange, at Hampton Court, 315; fine early, 315; at the Inner Temple, 334; and the frost, 334; are they semi-aquatic plants, 334; aphids, 359; popularity of, 361; the season, 361; earthworms, mildew, new varieties, effects of the frost, 362; notes on new varieties, watering, 387; size of the, 392; at Westminster Aquarium, 389, 467; notes on, 421, 418; at Finsbury Park and Camberwell, 399; Morden Hall, Combe Leigh, Swanley, Slough, Putney, and Inner Temple, 400; Swanmore Park, Highgate, Holloway, Chelsea, and Forest Hill, 401; exhibiting, for grouping, 414; judging, 414; Japanese Anemone, 426; fine bloom of Mr. Bunn, 424; Sœur Dorothee Souille, 427; new French, 440; early-flowering, 455; Henri Jacotot, 443; at Exeter, 446; La Purété and Mdlle. Lacroix, 447, 470; growing exhibition blooms, 461; new, 461; varieties certificated, 464, 489; at Spike House, Hammersmith, 470; at Messrs. Laings and Parkfield, 471; review of the season, 483; judging, 488; specimens, 491; Cullingfordi, 493, 542; judging, 514; new at Veitch's, 516; Boule de Neige, Queen of the Yellows, 522; Boule de Neige, 539; Belle Paulie, 540; Mrs. Heale and Princess of Wales, 542; an American show, 542; Boule d'Or, 543; show reports, 543; Carter's Bronze Queen, 543; culture, preparing plants for cuttings, 544; trained specimens, 546; culture, best time for striking cuttings, 557; essay on the culture of, 561; new single, 567; at Birmingham, 582; trained specimen, 584; notes on, 588; Golden Meg Merriettes, 595
 Chrysanthemum Shows—Peckham, Ealing, 409; Lambeth, Brixton, 410; Richmond, 429; Havant, Crystal Palace, 420; Kingston, 431; Putney, 432; Stoke Newington, 432; Croydon, 433; National Society, 433; Weston-super-Mare, 452; Bath, 452; Weybridge, 451; Leicester, Gravesend, Portsmouth, Chiswick, 453; Brighton, Basingstoke, 453; Finchley, Lindfield, Lincoln, Reading, Huddersfield, 455; East Grinstead, Shrewsbury and Yeovil, 474; Cuckfield, Burton, Bristol, 475; Lewisham, Birmingham, 476; Taunton, Newport, 477; Hull, 478; Winchester, Sheffield, 479; New York, 517; Felling-on-Tyne, 568
 Chrysanthemum Society's (National) medals, 493; Meetings 314, 362, 493, 542; Schedule, 334; Dinner, 516
 Clarence Show, 189
 Cissus discolor, culture, 573
 Clarifying cider and perry, 328
 Clematises—C. indivisa lobata 48; beds, 252; varieties of, 351; Lucie Lemoine, 371; for conservatories, 371
 Clerodendrons, 238
 Cleverley, new houses at, 524
 Climbers, hardy, 125
 Chip for glass 271

Clonmel Show, 493
 Cloverley, notes at, 163
 Coccoloba pubescens, 181
 Cocoa-nut, Palm, culture of, in America, 517
 Concrete walks, 595
 Cones and berries, 222
 Conservatory, climbers for a warm, 137; ventilating a, 262
 Cordon trees, angle for, 392
 Cotton seed as food, 403
 Craik John Downie, 470
 Cranberry marshes in Wisconsin, 358
 Crassula coccinea, 195
 Crocuses in lawns, 329
 Crotons, 55; at Liverpool, 85; leaves falling, 143
 Croxdon Show, 28
 Cryptogamic Society of Scotland, 338
 Crystal Palace Fruit Show, 324; Shows for 1885, 561
 Cucumbers—roots diseased, 4; culture, 557; disease, 41; for winter, 98, 168; falling, 148; for autumn, 214; Cardiff Castle, 205; ridge, 213; forcing, 259, 300; Roffey's Improved Telegraph, 333; judging, 557; in autumn, 369; winter treatment, hot-beds for, 570
 Culzean Castle, Grapes at, 555
 Currants for market, 266
 Cutbush, death of Mr. James, 108
 Cyclamens at Aigburth, 423; culture, 570
 Cymbidium Lowianum, 25, 23
 Cyripediums—458; Stonei, 220; Spicerianum, 446; Godefroyae, 579
 Daffodils, notes on, 365, 428, 443
 Dahlias self-sown, 18; prizes for seedling, 182; National Show, 227; new, 228; exhibiting, 251; tabulated list of varieties at the National Dahlia Show, 290; at Antwerp, 315; preserving tubers, 379
 Darlington Rose Show, 36
 Dean, Mr. R., presentation to, 293
 Decnmaria barbarea, 540
 Dendrobium—Wardianum resting, 168; noble, pruning, 495, 517, 546; imported, 565
 Dianthus chinensis from seed and cuttings, 104
 Dielytra spectabilis, 412
 Diplacis glutinosus, 48
 Dodecatheon splendendum, 106
 Dracaena, 55; Douceti, 132; propagating, 195
 Dracopetalum virginicum album, 93
 Drought, teachings of the, 128, 152
 Drumharg Woods, 336, 359
 Drummond's turf-cutting machine, 31
 Dundee Flower Show, 229
 Dunfermline and West of Fife Show, 211
 Dyer, Mr. W. T. T. Bisseton, 561

Ealing Show, 31
 Ealing Society, twenty-first anniversary, 294
 Echeverias, propagating, 100
 Edinburgh Show, 248; Congress of Apples and Pears at, announced, 338
 Elm, the, 347
 Endive, 75; planting, 168

 International Horticultural Ex-hibition, proposed, 336, 417, 439
 Ionopodium acule, 337
 Irises—atropurpurea, 3; Ger-mani, 7; reticulata, 16; Kamper-feri at Kew, 66; bulbous, 436
 Irrigation, automatic, 159
 Ismenes, notes on, 139
 Isoclepis gracilis, 146
 Ixoras, 339
 JACOB'S LADDER, 46
 Java Botanic Gardens, 380
 Jersey Lilies, 57
 Judges and their work, 203, 335, 450, 489
 Judging—window plants, 57; at exhibitions, 294, 255, 380; reflections on, 485; at the Bath Show, 490, 521; evenness of collections, 537
 Junipers, pruning, 34
 KENT, A DAY IN, 107
 Kinn dust, 302; for fruit trees, 328
 Kingston Chrysanthemum So-ciety's Annual Meeting, 560
 Kitchen garden, work in the, 32, 167, 347, 434, 569
 LABELS—making zinc and ink for, 381; rendering durable, 392; zinc, out of doors, 429; preserving wooden, 492
 Laburnums for town gardens, 483
 Ladds, establishments of Mr., 107
 Lelias, 458
 Ladybirds, 16
 Lambeth Amateur Chrysanthemum Society, 516
 Lapagerias at Chelsea, 338
 Larch, profitable planting, 357
 Lascelles, death of Mr. W. H., 402
 Lathyrus sativus, 63
 Lancelis, pegging down, 483
 Lavatera arborea variegata, 153, 182
 Lawns, worms on, 284; tennis ground, improving, 370
 Leaf mould for Rhododendrons, 38
 Lee, Blackheath, and Lewisham, 49
 Leeds Show, 3
 Leeks, 258
 Lettuce on Celery ridges, 40; Veitch's Perfect Gem and Webb's Summerhill, 86
 Leuca endron argenteum, 414
 Life, the difficulties of, 582
 Lilac, pruning, 13
 Lilies, stem roots of, 5, 51
 Lilies and Roses, 82
 Limes, gall-mites on, 34; leaves, gall on, 57
 Liliums, forced, 48; candidum, 75, 247; candidum in winter and summer, 84; virginal and platyphyllum, 85; in pots, Harris, 98; anrattum platy-phyllum, 250; speciosum ru-brum cruentum, 294; auratum floriferous, 316; Szovitzianum, 367; longiflorum and Harris, 412
 Lily of the Valley, 412; forcing, 488
 Limestone, planting slopes on, 457
 Linnæan Society, meetings of, 336
 Lisianthus Russellianus, cul-ture of, 545
 Littonia Keetii, 48
 Liverpool Show, 118, 498
 Lobelias, tall growing, 274
 Logwood, 535
 London's lesser open spaces, 70, 212, 322, 445, 590
 Loquat, fruiting in England, 494
 Lychnis vespertina plena, 250

MADRESFIELD COURT GRAPE 336
 Mahonia aquifolia, uses of, 170
 Maldstone Rose Show, 10
 Malt and kiln dust, 302
 Manchester, notes at, 65; shows for 1886, 560
 Mangrove and Mandrake, 360
 Manures—relative value of, use of, in gardens, 153; paring, 573; a useful, 583
 Marden Park, 409
 Marston Gardens, the, 296
 Matthiola bicornis, 42
 Maurandya Barclayana, his-tory of, 317
 Mealy bug, clearing Vines of, 288
 Measres, market, 35
 Medinilla magnifica, 429
 Medlar, the, 171
 Melons, 55; flavourless, 81; cul-ture of, 146, 193; classification of, 178; twelve hundred plants, 250
 Meteorological observations at Hodgeok Priory, 43, 134, 229, 493, 517; Meetings of the Royal Society, 471, 516, 568

THE ROYAL STRAWBERRY GARDENS.

THE above is the heading of a circular that fell into my hands a week ago; it was adorned with the Royal Arms, and contained the following announcement:—"Thomas Sharpe begs to inform his patrons and the public that his Strawberries are now ripe. An early inspection is solicited. The public are admitted to the beds and allowed to gather and eat the fruit at 9d. each person." As I was informed on good authority that the method of culture adopted by Mr. Sharpe is as remarkable as the manner of disposing of some of the produce is novel, I was impelled to inspect the plants that had produced the splendid dishes to which I had seen first-prize cards attached at more than one exhibition.

The Royal Strawberry Gardens, then, are situated at Knowle Hill, Chertsey, but the nearest station is Virginia Water, a mile distant. As many persons know, the district is delightful and salubrious, and on that account was selected by the late Mr. Holloway for those princely gifts—the Holloway College for women, and Sanatorium for the mentally afflicted, on which have been expended about a million pounds sterling. The latter is close to the station, and is a magnificent pile, approached through extensive and beautiful grounds in which the choicest of trees, shrubs, and Conifers have been planted unstintingly yet effectively. This splendid establishment is worthy of more than a passing glance, but as the Strawberries are tempting we pass to the "gardens," and find a field—of sand.

Some twelve years ago Mr. Sharpe, who is a practical gardener, took this field, not for growing Strawberries, but to make the best he could of in growing crops generally. Amongst other things Strawberries were tried, and the results were surprising. There are now three acres of them, about two in bearing, and from 400 to 500 lbs. of the finest dessert Strawberries to be found in London have been gathered daily for the last ten days—so fine and also early that the first week's consignments realised 2s. a pound. That is something for outdoor Strawberries on land that resembles a sandy beach from which the tide has receded. It is quite astonishing to see such prodigious crops of fine fruit in such apparently miserable soil, and the more so to learn that no manure in any form whatever is used in their production. Mr. Sharpe is not an enthusiast nursing a fad, but a quiet, thoughtful, industrious gardener, animated with only one desire—namely, cultivating his land the most profitably; and he would trench and manure in the orthodox manner if he found it advisable to do, but he does not. He trenches in his old beds periodically, and has tried the effects of manuring, but it only gave him a finer crop of leaves, adding nothing to the weight of the fruit, and certainly nothing to its quality, while the shade afforded by the stronger foliage impaired its colour—an important factor in produce for sale.

It is very extraordinary, too, that in this bed of sand the plants last so long. One bed is seven years old, and the plants are laden with fruit—so much so that they will pro-

bably be left another year. It is small in comparison with that on three-year and four-year-old plants, but ripens earlier, which is important, while the quality is very superior. Some of the beds have been trenched in, and the ground at once planted again without a particle of manure; and although this has been done twice—that is, the present is the third plantation on the same site—there is not the slightest deterioration in the crops either as regards the quantity or the size of the fruit.

The plants generally are characterised by a compact sturdy growth and small thick leaves, the trusses rising above them and falling in a whorl on the ground quite beyond the foliage. It is a sight to see the huge fruit of Marguerite piled one on the other in a thick ring round the plants, some of them apparently bearing 2 or 3 lbs.—probably more. There is no need to search for them, for they positively lie in heaps, not a truss and hardly a fruit being shaded by the foliage.

The method of culture is briefly this: Runners, which are sparsely produced, are taken when they can be had after the fruit has been gathered, and inserted in nursery beds, where they remain till March, when they are put out about 2½ feet apart. The flower trusses that soon after appear are picked off, the cultivator not finding it prudent to crop the plants in a small state, as he loses more in the end by weakening them than he gains at the beginning in allowing the first trusses to develop. They are never mulched and never watered artificially, for there is no well or water store in the field. The ground is made firm, indeed as hard as possible, and is then hoed systematically, so as to have an inch of loose sand on the surface. This really acts as a mulch, for scarcely any moisture can pass through it by evaporation in hot weather. Mr. Sharpe has been a reader of this Journal for years, and was impressed by the writings of the late Mr. Fish on that subject, and the information he has turned to practical and profitable account. The ground is covered with long grass for keeping the fruit clean, and when the season is over the runners are cut off, but no leaves, the litter is cleared away, and the hoe set to work again. That is the simple routine. The ground is not trenched except when turning in old beds, and the sand is about 20 feet deep before water is reached.

The first quality fruit is gathered from daylight till seven o'clock in the morning, every fruit being without blemish, carefully packed in leaves in flat pound punnets, and reaches London by train in time for the breakfast tables of the affluent and first-class hotels. The "seconds," or smaller yet very good fruit, is gathered from five o'clock till dusk, and packed without leaves in "deep pounds." These punnets being a little wider at the bottom than the top, can be packed one on the other without crushing the fruit, and they are so arranged in large boxes. The flat pounds of prime fruit are arranged in shelved boxes, one side being hinged at the bottom, so that the door thus formed falls down, and the series of shelves, about 3 or 4 inches apart, are accessible and quickly filled, each box holding five dozen punnets. No doubt the porters at each end receive a little present of fruit, and are thus induced to take a personal interest in the delivery of the market consignments in good condition—a point of the greatest possible moment in the transmission of soft fruit, as 3d. or more a pound is easily rubbed off choice Strawberries, and much more off Grapes, by rough handling and faulty packing. The small fruit is sold for preserving in the surrounding district, and a great deal large and small disposed of in the "ninepenny feasts."

After trying many varieties, the following are mainly relied on for giving a full supply of fruit for a month:—Marguerite and Princess Alice Maud, early; then Sir Joseph Paxton, Empress Eugénie, British Queen, and Comte de Paris following closely in the order named. Neither Black Prince nor Vicomtesse Hericart de Thury is of any use in the sand at Knowle Hill, as the fruit is too small, while Marguerite is as early as the Vicomtesse, with fruit of thrice

the size. This is the most profitable, and is worth trying in all light soils and warm positions—in fact everywhere, for no one knows where particular varieties of Strawberries will succeed without trying them. It is a French variety, and is described as follows in the “Fruit Manual”:—“Fruit very large, conical; skin bright shining red; flesh bright orange, solid, juicy, sugary, and richly flavoured. It is of immense size, and sometimes weighs as much as $3\frac{1}{2}$ ozs.” At Knowle Hill many of the large fruits are somewhat wedge-shaped and ribbed, and the colour, orange red, renders it a favourite for preserving; but some others are of higher quality for dessert in the soil in question; yet the fact remains that Marguerite produces the heaviest crops, and the fruit realises the best price of all, so imposing is its appearance. Princess Alice Maud is a favourite old market Strawberry, as it travels well, and can generally be relied on for a good crop in most soils. Sir Joseph Paxton is a well-known Strawberry of sterling merit, and is grown very extensively in Kent; it is perhaps the best midseason variety. Empress Eugénie bears heavy crops of good sized, but not very large, fruit in the sand. The fruit is firm, colour very rich, and quality quite first-rate, nearly equalling that of the British Queen—the queen of all for quality, and never fails to produce admirable crops with Mr. Sharpe. The last is Comte de Paris, than which no variety grows better in the light soil, and a fine crop is swelling. I am not certain there are not two varieties under this name in cultivation. Be that as it may, the one at Knowle Hill is valuable because of its decided lateness; the fruit is of good size and colour, with a brisk agreeable flavour. A few other varieties are grown, including The Captain, on trial, but the above are relied on, and will yield tons of fruit during the next three weeks.

The ground slopes sharply to the south, and is sheltered by woods on the north, east, and west—a great advantage for early ripening, and the first good fruit in the market invariably commands the highest prices.

The Royal Lake, Virginia Water, is about a mile from Knowle Hill. It is 365 acres in extent, boldly irregular in outline, surrounded with plantations, and altogether it is not easy to imagine a more beautiful example of English scenery to which the public have access all the year round. It is twenty-three miles from London.—J. WRIGHT.

THE HISTORY OF THE CHRYSANTHEMUM.

(Continued from page 523.)

THE following, translated from the original Chinese by Mr. Reeves, will serve as examples of the names by which the Chrysanthemum was known in the Celestial Empire. “The purple lily, the white waves of autumn, the purple pheasant’s tail, the scarlet robe, the yellow gold thread, the purple butterfly, the purple pheasant’s feather, the yellow tiger’s claw, the crystal white, the drunken lady.” It was, however, only a year or two after this rather trifling anxiety arose that a way out of the dilemma was found, for as soon as the French florists began to take them in hand the old system of nomenclature was entirely discarded, and following in the footsteps of the Dutch a kind of floral hero-worship started into existence, and the newer kinds were named after many of the principal celebrities of France and other countries.

Respecting the diversity of opinion as to the genus to which the large-flowering or Chinese Chrysanthemum, as it was commonly called, a word or two may be usefully inserted here. Mr. Joseph Sabine, whose writings afford much interesting and useful information on this point, and to which the author is almost wholly indebted for the particulars already given, contended that the varieties then known were not the *C. indicum* of Linnaeus, although he considered such a species did exist, and strongly advised its importation. In several very able and exhaustive papers read by him before two of the learned and scientific societies of which he was a member, he gave a long explanation of his study and researches, definitely setting the whole question at rest, the result being that the small-flowering variety was the true *C. indicum*; whereas the large Chinese Chrysanthemum of 1789 and its successors were proved by him to belong to an entirely different species, and thenceforth to be properly known as *C. sinense*.

In one of these papers lists are given and references made to all the previous writers on this plant, upon a perusal of which it is seen

that the Indian and Chinese Chrysanthemums had been subjected to no fewer than twenty-six various designations. Notwithstanding his labours many people, probably from ignorance and custom, still clung to the old and incorrect name, and as late as 1827 a contributor to “Hone’s Table Book,” under the heading “Winter Flowers,” refers undoubtedly to the Chinese Chrysanthemum as *C. indicum*. This writer, who of course is not quoted as any authority, explains its service in enlivening the dreary months of November and December, and tells us that there were then about forty varieties of it in this country, for the greater part of which we are indebted to the London Horticultural Society. He describes the facility with which it is propagated and the dissimilarity in the forms of the flowers, as well as in the formation of the petals, and concludes with a list of those which particularly engaged his attention, among them being the pure or large paper white, the early blush, the golden lotus, the superb clustered yellow, and the starry purple. Mr. Hone’s correspondent, who adopts the pseudonym of “Jerry Blossom,” says there is little chance of its ever ripening its seed on account of the blooming season being at the commencement of the winter, an opinion previously expressed by Mr. Sabine, nor does any mention appear of the Chrysanthemum having been raised from seed up to this time. It was therefore felt that whatever new kinds made their appearance they must be brought from India or China, and Mr. Salter was of opinion that seed was never saved in England prior to 1830.

We are told by Mr. Burbidge in his recent work on the Chrysanthemum that in or about that year the first English seedlings were raised by Mr. Isaac Wheeler, gardener and porter at the Magdalen Hall (now Hertford College), Oxford, and that these were reared from home-saved seeds at Beaumont Buildings in that city. On December 2nd, 1832, Mr. Wheeler exhibited some of his seedlings in London, and received a silver Banksian medal for them as the earliest seedling Chrysanthemums raised in England. This medal and a drawing of one of the plants may yet be seen in the possession of a member of the Wheeler family still resident in Oxford. Somewhere about the year 1835 seedlings which Mr. Salter calls the first English *bonâ fide* ones were raised in Norfolk by Mr. Short and Mr. Freestone, the latter of whom obtained Prince of Wales, the well-known incurved variety, which is represented in a coloured plate forming the frontispiece to Mr. Salter’s book. Nonpareil and Norfolk Hero, the latter variety of which has probably shared the same fate as those previously mentioned, were also among the first sorts raised in that part of the country.

The love of floriculture in that country is proverbial, and it was not long before the people of Norwich inaugurated the first Chrysanthemum exhibition, which was held in 1843. Three years later this was followed by one in London under the auspices of the Stoke Newington Chrysanthemum Society, afterwards called the Borough of Hackney, but which has more recently adopted the title of the National Chrysanthemum Society, at the shows of which may be seen blooms of the Chrysanthemum that would probably astonish the most skilful Chinese or Japanese gardener.

Almost every important town in England has followed suit, and Chrysanthemum societies are still being formed in many of the smaller towns, showing how greatly is this plant appreciated. The prizes offered are in many cases of very considerable value, and include silver cups and money prizes amounting to sums as high as £15.

The following is a list of some of the most prominent Societies established for the purpose of encouraging the culture of Chrysanthemum and other floricultural associations which have annual exhibitions of this flower:—Aylesbury Chrysanthemum Society; Ascot, Sunninghill, and District Horticultural Society; Brixton, Streatham, and Clapham Chrysanthemum Society; Brighton and Hove Chrysanthemum Society, Bath and Floral Fête Committee, Bromley Chrysanthemum Society, Basingstoke Horticultural Society, Birmingham Chrysanthemum Society, Bristol and Clifton Chrysanthemum Society, Burton-on-Trent Chrysanthemum Society, Croydon Horticultural Society, Colchester Horticultural Society, Canterbury Gardeners’ Mutual Improvement Society, Crystal Palace, Cheltenham Chrysanthemum and Fruit Society, Colchester and East Essex Horticultural Society, Cambridgeshire Horticultural Society, Chesterfield Chrysanthemum Society, Chelmsford and Essex Horticultural Society, Dorset County Branch of the National Chrysanthemum Society; Ealing, Acton, and Hanwell Horticultural Society; Gravesend and North Kent Chrysanthemum Association, Hull and East Riding Chrysanthemum Society, Havant Chrysanthemum Society, Huddersfield Chrysanthemum Society, Headington Horticultural Society; Highgate, Finchley, and Hornsey Chrysanthemum Society; Ipswich Horticultural Society, Kingston and Surbiton Chrysanthemum Society, Lambeth Amateur Chrysanthemum Society, Liverpool Horticultural Association, Lincoln Chrysanthemum Society, Leicestershire Chrysanthemum Society, Loughborough Chrysanthemum and Fruit Society, Lindfield Chrysanthemum Society, Manchester Botanical Society,

National Chrysanthemum Society, Northampton Chrysanthemum Society, Newport (Mon.) Horticultural Society, Oxfordshire Chrysanthemum and Fruit Society, Putney Chrysanthemum Society, Richmond Horticultural Society, Reading Chrysanthemum Society, Royal Horticultural Society, Royal Southampton Horticultural Society, Saffron Walden Horticultural Society, Sheffield and West Riding Chrysanthemum Society, Scarborough Floral and Horticultural Society, Tunbridge Wells Chrysanthemum Society, Tonbridge Gardeners' Mutual Improvement Society, Twickenham Horticultural Society, Taunton Chrysanthemum Society, Weald of Kent Gardeners' and Mutual Improvement Society, Walton-on-Thames Chrysanthemum Society, Yeovil Chrysanthemum Society.—C. HARMAN PAYNE.

(To be continued.)

LEEDS FLOWER SHOW.

DESPITE the many serious losses this annual event has entailed for many years past in consequence of unfavourable weather, yet the very excellent Secretary (Mr. J. H. Clark) wisely determined to make at least one more effort to retain the Show and its prestige. With that object in view he invited the several tradesmen who would be principal creditors to meet him; he then submitted a statement to them showing the average receipts during the last ten years, and along with it a proposed approximate expenditure for this year's Show. On careful consideration it was thought that by reducing expenditure, and being hopeful of being favoured with fine weather, this year's Show might prove to be one of the most successful ever held for many years past. Those tradesmen (to their honour be it recorded) immediately replied, "We will not allow the Leeds Flower Show to lapse even for a year if our services will assist to maintain it." Surely that may fairly be considered patriotic, seeing it entailed a chance of losing their several accounts, along with their proportionate share of others that they might be called upon to defray to the amount of about £200. A schedule of prizes, &c., was at once adopted, and along with it *pro rata* rules, giving all exhibitors, along with the Committee, an equal share in the success of the Show. The exhibitors responded beyond expectation.

Knowing how much all had risked, both exhibitors and Committee might have been excused if despondency, or even despair, had overwhelmed them, when on the evening preceding the morning of Show it commenced to rain as usual, and by daylight the next morning the rain was descending in torrents, continuing to do so the whole day without one moment's intermission, but, to their credit be it said, not one murmur escaped their lips.

To the Show too much praise cannot be accorded, as it contained some of the best specimens in its several departments that could be produced anywhere; but as many of them had been exhibited at York the previous week and fully noticed in the Journal, it is not here necessary to do more than refer to page 533, and to the appended prize-list.

Especial commendation is due to the several celebrated growers who kindly contributed specimens of their specialities—namely, Messrs. R. Smith & Co. of Worcester, a splendid collection of Clematises, each plant averaging 3 feet in diameter, in perfect health, and covered with flowers—these were much admired—and a seedling named Beauty of Worcester, a medium sized flower, colour violet-purple, with creamy white stamens in centre, adding much to its beauty, was awarded a first-class certificate of merit. The Liverpool Horticultural Company (John Cowan, Limited) contributed a beautiful collection of miscellaneous, stove, greenhouse, and decorative plants, along with a few Orchids, Vines, and Roses, which helped materially to adorn the entrance tent. Messrs. J. Laing and Co., Forest Hill, London, contributed both plants and cut flowers of their celebrated collection of Tuberous Begonias, which found many admirers. Orchids were represented, and contained some fine plants and varieties.

In the cut flower department very special commendation is due to Mr. Cypher for his beautiful arrangement of "Group of natural flowers in vase or ornamental stand for dinner table." It was unsurpassable. The same meed of praise may be accorded to Mr. Wright's bride's bouquet along with Mr. Cypher's vase; they were considered to be perfect in every attribute. Messrs. J. Dickson & Son, Newton Nursery, Chester, made a most effective display with collections of hardy herbaceous flowers, such as Pæonies, Irises, &c.; also Messrs. R. Smith & Co. with a similar collection.

Mr. S. Hartley, nurseryman, Headingley, Leeds, contributed a fine collection of double and single Pyrethrums, as well as the collection of twelve bunches or spikes of hardy herbaceous flowers, which obtained for him the first prize.

Roses were very good, more especially those of Mr. J. House of Peterborough; they were truly superb specimens, and deservedly obtained first prizes in every class, Messrs. Cranston being second with good blooms, but wanting the freshness so conspicuous in Mr. House's collections; Mr. May of Bedale being third. Mr. House contributed a collection of Tea and other Roses, including W. A. Richardson, which from the novelty of its colour attracted many admirers; he had also a nice stand of his new seedling Rose named Miss House, which had awarded to it a first-class certificate. Messrs. Cranston had a stand containing a grand lot of Mons. Noman.

Uniformity of excellence was the prevailing characteristic in the fruit department. Appended is the prize list:—

PLANTS.—Twelve stove and greenhouse ornamental and flowering plants, not less than six in flower, Orchids excluded.—First, Earl of Zetland; second, Mr. Cypher; third, Mr. G. Gelder. Six stove and greenhouse plants in flower, Orchids excluded (amateurs).—First, Earl of Zetland; second, Mr. G. Gelder. Specimen stove or greenhouse plant in flower.—First, Earl of Zetland; second, Mr. Gelder; third, Mr. Grosvenor Talbot. Ornamental or fine-foliage plants, with or without bloom.—First, Mr. Cypher; second, Mr. J. Barran, M.P. Group of miscellaneous plants, arranged for effect, and occupying 300 square feet.—First, Mr. J. Barran. Group of ditto, occupying 150 square feet (amateurs residing in Yorkshire).—First, Mr. G. Talbot; second, Mr. G. Gelder. Six Orchids in flower, distinct.—First, Mr. Cypher; second, Mr. Walter Bateman; third, Mr. B. Hemsworth. Three Orchids in flower, distinct (amateurs).—First, Mr. J. Barran; second, Mrs. Tetley; third, Hon. Mrs. Meynell-Ingram. Specimen Orchid.—First, Mr. G. Talbot; second,

Mr. J. Barran; third, Mr. Cypher. Six stove or greenhouse Ferns, distinct.—First, withheld; second, Mr. G. Talbot; third, Mr. W. J. Dixon. Three stove or greenhouse Ferns, amateurs.—First, Mr. G. Talbot; second, Mrs. Tetley; third, Mr. J. Barran. Twelve Roses in flower, distinct.—First, Pybus & Son, second, withheld; third, Mrs. Tetley. Six do.—First Pybus & Son; second, Mrs. Tetley; third, Mr. B. Hemsworth. Three do., amateurs.—First and second, withheld; third, Mrs. Tetley. Specimen Rose.—First, Pybus & Son. Twelve Show Pelargoniums, including spots.—First, Mrs. Tetley. Six do., amateurs.—First, Mrs. Tetley; second, withheld; third, Mr. G. Talbot. Six Fancy Pelargoniums.—First, Mrs. Tetley. Six Zonal Nosegay or Hybrid Nosegay Pelargoniums.—First, Pybus & Son; second, Mrs. Tetley; third, Mr. G. Talbot. Six double-flowered Pelargoniums.—First, Mrs. Tetley; second, Mr. B. Hemsworth. Six Fuchsias, distinct.—First, Mr. J. Barran; second, Mr. B. Hemsworth; third, Mrs. Tetley. Six Gloxinias, distinct.—First, Mr. B. Hemsworth; second, Mr. W. J. Dixon.

CUT FLOWERS.—Group of natural flowers, in vase, for dinner table.—First, Mr. Cypher; second, Mr. G. Talbot. Twenty-six wedding bouquets, First, Mr. G. Talbot; second, Mr. Cypher; third, Mr. J. Barran. Ball

Fig. 1.—Iris atropurpurea. (See page 7)

bouquet.—First, Mr. G. Talbot; second, Mr. Cypher; third, Mr. Barran. Thirty-six distinct Roses.—First, Mr. John House; second, Cranston Nursery Company; third, Mr. May. Eighteen distinct Roses.—First, Mr. House; second, Cranston Nursery Company; third, Mr. May. Twelve distinct Roses (amateurs).—First, Mr. J. Trees; second, Mr. B. Hemsworth; third, Mr. W. Bateman. Twelve distinct Tea-scented Roses.—First, Mr. House; second, Cranston Nursery Company; third, Mr. H. May. Six bunches or spikes of cut stove or greenhouse flowers, distinct.—First, Mr. J. Barran; second, Mr. G. Gelder; third, Mr. B. Hemsworth. Twelve do. of hardy herbaceous perennial flowers, staged similar to Roses.—First, Mr. S. Hartley.

FRUITS.—Collection of six varieties of fruits, two varieties of Grapes of two bunches each allowed.—First, Hon. Mrs. Meynell-Ingram; second, Sir H. M. Thompson. Collection of four varieties, Pine excluded.—First, Hon. Mrs. Meynell-Ingram; second, Hon. R. C. Parsons; third, Sir H. M. Thompson. Two bunches black Grapes.—First, Mr. H. Gill; second, Sir H. M. Thompson; third, Mr. Ayscough Fawkes. Two bunches white Grapes.—First, Hon. R. C. Parsons; second, Lord Hotham; third, Mr. R. Grindrod. Grapes, heaviest bunch, any colour.—First, Mr. H. Gill. One Pine.—First, Mr. W. Birks; second, Mr. T. Hare; third, Mr. J. H. Goodacre. Six Peaches.—First, Mr. J. Thompson; second, Mr. A. Fawkes; third, Hon. R. C. Parsons. Six Nectarines.—First, Mr. T. Diamond; second, Mr. B. Hemsworth; third,

Mr. F. Hares. One Melon.—First, Mr. T. Hare; second, Mr. A. Fawkes; third, Mr. Grindrod. Six Figs.—First, Mr. A. Fawkes; second, Mr. J. Barran. Fifty Cherries.—First, Mr. T. Hare; second, Sir H. M. Thompson; third, Mrs. Naylor. Fifty Strawberries.—First, Mr. Goodacre.

NEW ROSES.

THE following list of new Roses, which can be shown at the National Rose Society's Exhibition in the classes provided for varieties not in commerce in England previous to 1883, has been carefully drawn up by T. W. Girdlestone, Esq., and will be found useful by intending exhibitors:—

Admiral Courbet
Admiral Seymour
Alexandre Dupont
Alexandrine Bruel (T.)
Aline Rozey (T.)
Alphonse Soupert
André Gill
André Schwartz (T.)
Annette Murat (T.)
Antoine Chantin
Antoine Mermet (H.T.)

CUCUMBER ROOTS DISEASED.

I AGREE with "S. W., Yorks," about the use of quicklime as a cure for diseased cucumber roots. It will do more than that; if used early enough it will prevent disease or canker both in Cucumbers and Melons. The writer had charge of the Cucumber and Melon houses under Mr. Jones at Frogmore twelve years ago; and those who had the pleasure of seeing the garden there at that time know what sort of crops were grown. It was my duty then to place a ring of fresh lime round each plant 4 inches away from the stems, and to water up to it, but not inside it, and it was considered a preventive of disease in Cucumber roots and also of canker in Melons. Here I have had very little experience of either of these, but I attribute my success to the use of a handful of quicklime placed on pieces of tile or glass, and stood between the plants. This in

my opinion absorbs the superfluous moisture and thus keeps the plants safe.—G. M. W.

THE WHITE WATER LILY.

THERE is a too common impression that to grow and flower with any degree of satisfaction the common white Water Lily (*Nymphaea alba*), it is absolutely necessary to have either a lake or a pond, and hundreds of people are deterred from growing it because they possess neither. Though few people will dispute that most plants generally succeed the best, and look the best, under natural and unrestricted conditions, and none more so than Water Lilies, no matter whether it be the *Victoria regia*, *Euryales*, *Nymphaeas*, *Nuphars*, *Limncharis*, or *Aponogeton*, yet I shall endeavour to show that satisfactory results and a great deal of pleasure may be derived by cultivating this charming Lily in a more humble and restricted way than is commonly practised, and I may here state that most other *Nymphaeas* may be grown in equally limited spaces, the principal difference being in temperature.

Nymphaea alba is a native of Britain, is, therefore, quite hardy, and in warm localities and a pure atmosphere it is very floriferous. There are, however, places where the atmosphere is very impure from various causes, and where, as a consequence, the sunlight is not near so intense as in districts but a few miles away, and the mean annual temperature is also rather lower. From these two causes alone this Lily does not produce many flowers when grown out of doors under such conditions, but if the shelter of glass is afforded in localities like these the number of flowers produced by a very small plant is almost astonishing. But someone will say, "Who is going to build an aquatic house to grow the common Water Lily in?" I do not suppose anyone will build a house for such a purpose, nor am I going to suggest it, but I wish to show the dwellers in large towns, and who have neither lake nor pond in which to cultivate their aquatics, how they may have dozens of pure and star-shaped Water Lilies.

My employer, several years ago, expressed a desire to have this beautiful plant in his garden, but possessing neither of the above conveniences, nor yet a large tank or tub of any kind, I could not at the moment see how I was to gratify his desire. After some time I found a large box of the following dimensions—length 4 feet, breadth 2 feet 3 inches, depth 1 foot 4 inches. This we had lined with lead and made watertight, and on one side, 1 inch from the top, was inserted a three-quarter inch overflow pipe. Here we had, at a trifling cost, an aquatic tank that will last a long time, but I should like it better if it were a foot wider. This tank was placed at the end of a small lean-to greenhouse with south aspect, and from which frost only is excluded. Half a barrowful of strong loam, with a little decayed manure added, was put in the bottom of the tank, a small plant was obtained from a friend and planted in the centre, a few large stones were placed round the crown of the plant to keep it in its place while the water was poured in through a rose, and when the water rose to overflow pipe the work was done. The water should be soft, we use rain water. In course of time several plants of *Aponogeton distachyon*, or Cape Pondweed, was added, and these throw up dozens of Hawthorn-scented pure white flowers the year round. The *Nymphaea* gives us three, four, and five flowers at a time for several weeks, and odd ones through the summer. In order to obtain all this beauty year after year we have only to add several pailfuls of fresh water every week. During the autumn months the leaves of the *Nymphaea* gradually die, and the *Aponogeton* and goldfish have the tank to themselves till the following spring, when the Water Nymph reappears in all her purity and beauty.—J. UDALL.

LORD NAPIER NECTARINE.

EARLY during the present season I recollect some remarks being made by one of your able contributors respecting the above Nectarine. These statements did not accord with my experience of this variety when grown under glass. I have always found Lord Napier one of the most abundant cropping varieties that has come under my notice. I have one tree under my charge which now measures 19 feet in width by 10 feet in depth, with a crop of over 300 fruits on it, nearly every one of which is fit for exhibition if so needed, being first-rate both in size and colour. I grant that in regard to flavour precedence must be given to a few varieties, but if allowed to become perfectly ripe before being taken from the tree this kind will not then leave much to be desired even by the most fastidious. This crop now makes the fourth, the average of which for the four seasons would be about 300 fruits. This may appear to some an excessive crop, but when taking into consideration the extremely robust character of the variety it is not so, causing the tree to be productive of good fruit-bearing wood more than would be the case with a light crop. We are just com-

mencing to gather the most forward fruit; some will, however, be left for several days yet. Both the tree and the fruit can be seen by anyone interested in this, one of the best "all-round" Nectarines raised by the late Mr. Rivers.—JAMES HUDSON, *Gunnersbury House Gardens, Acton, W.*

THE coming week will be a busy one for rosarians, as the great event of the season, the NATIONAL ROSE SOCIETY'S EXHIBITION, will take place on Tuesday next, and shows of a less important character are as numerous as could be desired by the most enthusiastic. We learn that there is good promise of an excellent display at Kensington, as the entries are already very abundant, and there is every reason to expect a keen competition in all the leading classes. The admirable blooms staged both by nurserymen and amateurs at the recent meeting of the Royal Horticultural Society augured well, and unless the weather should prove unusually treacherous within the next few days a thoroughly representative show may be confidently expected by intending visitors.

— THE conservatory in the Royal Horticultural Society's Gardens, South Kensington, is now permanently furnished with floral attractions of considerable importance. Hardy flowers constitute the chief portion of these, and the grand group from Mr. T. S. Ware is especially notable, as it comprises a large number of choice species and varieties tastefully arranged, and it is surprising to many people what beautiful effects can be produced by hardy flowers when judiciously arranged. Messrs. Barr and Son also have an extensive group of similar flowers, and Messrs. Kelway and Son contribute Peonies and their varied Pyrethums. These exhibits are greatly admired by visitors, and undoubtedly are assisting in popularising a useful and charming group of plants.

— MESSRS. CARTER & Co. 237 and 238, High Holborn, inform us that they have been awarded the highest prizes, consisting of four silver and six bronze medals, for the produce of their seeds at the Agri-Horticultural Exhibition held at Kandy, Ceylon.

— MR. HENRY R. NEWPORT, late of the Board of Trade, has been appointed Assistant Secretary to the Royal Horticultural Society.

— A CORRESPONDENT sends the following in reference to the KENT CHERRY CROP:—"The great Cherry sales in the fruit-growing districts of Kent have been held during the last few days. In consequence of the prospects of the crop throughout the country having been somewhat diminished by the May frosts there was more than the usual competition, and high prices were realised for each lot, last year's prices being generally exceeded. The Cherries on one estate alone fetched £1700. The crop of this fruit in most of the Kentish districts is a prolific one, notwithstanding the damage inflicted by frosts."

— ONE of the Spiderworts which has oval-shaped green leaves that occasionally come variegated exists in many gardens under the name of *Tradescantia zebrina*, and to that species it has been commonly referred, though it differs considerably from it. Examples of this which we sent to Mr. R. I. Lynch, Curator of the Cambridge Botanic Garden, some time since have now flowered, and have been authoritatively determined to be *TRADESCANTIA FLUMINENSIS*. The plant is widely distributed in British gardens, is very frequently seen in ferneries and on rockeries, so that it is satisfactory to obtain the correct name.

— A CORRESPONDENT sends us a pretty HYBRID HIBISCUS, which he describes as a cross between *H. Dennisoni* and *H. rosa sinensis fulgidus*. It is double and of a rosy salmon colour, with rich crimson at the base of the petals.

— SHOULD we experience another hot summer there is every prospect of an immense yield of GRAPES being secured in the en air vineyard at Cardiff, owned by the Marquis of Bute and planted and managed by the practical gardener, Mr. A. Pettigrew. The d last season was much the best hitherto gathered and converted into wine, no

less than three hogsheads being made by Mr. Pettigrew, and remarkably good it is. It is not effervescent, but in other respects it closely resembles champagne of the best brand, and is preferred by many good judges to these high-priced productions. The Cardiff wine is bottled off in a manner similar to champagne and labelled "Castell Coch." Any quantity of it could be sold at the rate of 5s. for the size of bottle known as "quarts," but owing to the fickleness of our climate it is not thought the experiment will ever prove sufficiently profitable to warrant an extension of the vineyard.

— NO. 5 of the Holiday Handbooks edited by Mr. Percy Lindley (125, Fleet Street), entitled THE HARTZ MOUNTAINS, and is in the same style as those we have previously commended, containing much useful and interesting information respecting the route through this picturesque district of the Continent. It is also liberally illustrated.

— RELATIVE TO THE STEM ROOTS OF LILIES we have received a reply to "Scientia" from Mr. E. Jenkins, but too late for insertion, and we can only print the following summary:—"Scientia" takes exception to my statement that 95 per cent. of imported Lilies commence basal root-action first. I still repeat it, and in doing so would draw attention to the words I used originally—i.e., 'imported Lilies.' The plan I adopted was this. The whole of them directly they were received were placed in cocoa-nut fibre in shallow boxes, and not a single bulb of *L. auratum* was potted till the basal root-action began, which I think is a full and sufficient proof justifying my statement. As to the many that fail annually after being received by purchasers, they are placed under various methods of treatment for which no nurseryman would hold himself responsible. The roots on the stems of various species and varieties of *Liliums* (not one only) are annually produced and annually perish. May this, then, be regarded as accidental or natural, and may these be stripped off without injurious consequences directly or indirectly?"

THE AURICULA ELECTION.

WE are now enabled to chronicle the result of the above election. It will be remembered that growers were asked to name the best six Auriculas in each class, also the best twelve varieties, three each from the four classes. At the same time a list was asked of the best twelve Alpines. The election was confined only to Auriculas in commerce. The following list speaks for itself. We would only mention that in some instances "Silvia" (Douglas) was classed as a white-edged variety, but its proper position being in the grey-edged division, it has been there placed. Other kinds were wrongly classed, but the votes accorded them have been duly credited.

GREEN-EDGED AURICULAS

Name.	Raiser.	Votes.
Prince of Greens	(Traill)	30
Col. Taylor	(Leigh)	29
Talisman	(Simonite)	18
Lovely Ann	(Oliver)	16
Anna	(Traill)	16
Freedom	(Booth)	13
Imperator	(Lytton)	11
Champion	(Page)	11
Lycurgus	(Smith)	8
Apollo	(Beeston)	7
Prince of Wales	(Ashton)	5
Admiral Napier	(Campbell)	4
Mayflower	(Traill)	3
Alderman Wisby	(Headley)	2
Highland Laddie	(Pollitt)	2

The following took part in the election, and to them we return our best thanks for the assistance thus afforded:—The Rev. F. D. Horner, the Rev. H. H. D'Ombra, the Rev. E. C. Fellowes, Miss Woodhead; Messrs. J. T. D. Llewellyn, R. Gorton, W. Brockbank, T. Lansdown, C. Phillips, T. E. Henwood, J. Douglas, E. Wilson, W. F. Bateman, J. Garner, B. Simonite, W. Bolton, A. Potts, J. Ball (C. Turner), C. M. Royds, J. Cheetham, C. Orchard, H. White, T. Stirk, H. Wilson, R. Dean, H. A. Rolt, G. Thornby, J. Booth, F. Fife, and E. Pohlman.

[Accompanying the voters' returns were a number of interesting general remarks, which will be given in another issue of this Journal, together with the list of Alpine varieties.]

CANTERBURY ROSE SHOW.

THE anticipations which I announced a little while ago as to the forthcoming Rose season were realised at the "opening of the ball" at the old Cathedral city on Saturday last, the 27th. It was a real pleasure to find Roses so thoroughly in character and looking so fresh and bright, while the universal verdict was that there never had been so little aphid, nor ever did the plants look more healthy and promising; and, despite the rough and cold winds of the past few days, there was no sign of their evil influence on the many beautiful stands scheduled.

The Exhibition was the seventh that the Society (the Canterbury and Kent Rose Society) has held. Its name and scope has been somewhat altered. Formerly it was confined to East Kent, but is now open to the whole county, while several prizes are open to all England, and were sufficient to bring Messrs. Paul & Son from Cheshunt, Mr. Prince from Oxford, and Mr. B. R. Cant from Colchester, while the class for Teas induced Mr. Eckroyde Claxton to come all the way from Liverpool and enter as an amateur into competition with such redoubtable champions as Messrs. Prince and Cant in the class for twelve Teas, and, what is more, to cleverly beat them—a feat of which he may well be proud. The Show was held in the Foresters' Hall, by no means so good a room as the Corn Exchange either for size or light; but as the Committee had decided to hold the Show on Saturday, the Corn Exchange was not available. The stands were arranged around three sides of the room, with a double table down the centre, and on the fourth side the vases and bouquets were placed. Happily there was no place for a band, so that there was a possibility of enjoying a chat and taking a general survey. We found that Mr. W. H. Wakeley of Rainham was the most successful competitor, and that Canon Hodgson of Saltwood also occupied a prominent place. Mr. R. E. West of Reigate, Mr. Stanley, Mr. Claxton, and others upheld the credit of the amateurs, while, as I have said, some of the well-known Rose firms contributed much to the beauty and success of the Show. The following were amongst the principal prizes in the class for eighteen varieties, one truss of each:—Mr. W. H. Wakeley of Rainham was first with a beautiful box, which not only took the cup given by George Farley, Esq., but also the silver medal of the National Rose Society for the best box in the principal classes and the bronze medal of the National Rose Society for the best bloom. The box contained Mrs. Baker, Captain Christy, La France, Marquise de Castellane, Violette Bouyer (a beautiful bloom), Dr. Lovell (the best bloom of this variety I remember to have seen), Louis Van Houtte, Xavier Olibo (a splendid flower which claimed the bronze medal), Madame Gabriel Luizet, Prince Arthur, Duchess of Valombrosa, Camille Bernardin, Prince Camille de Rohan, Mons. Noman, Duke of Teck, Thomas Mills, Charles Darwin, and Duke of Edinburgh.

In the class for twelve varieties Capt. Knight of Bohning was first with Pride of Waltham, Marquise de Saunia, Captain Christy, Catherine Mermet, A. K. Williams, Duke of Edinburgh, Marie Van Houtte, Prince Camille de Rohan, Marie Rudy, Charles Lefevre, La France, and Souvenir d'un Ami. The Rev. H. B. Biron was a good second, and Mr. R. A. West an excellent third. In the class for twelve Teas or Noisettes, Mr. W. W. Wakeley was again first with Madame Welch, La Boule d'Or, Souvenir d'un Ami, Catherine Mermet, Vicomtesse de Vesins, Comtesse de Nadaillac, Caroline Kuster, Maréchal Niel, Souvenir de Paul Neyron, Jean Ducher, Marie Van Houtte, and Laurette. Captain Knight was second, and Mr. John Hollingworth of Turkey Court, Maidstone, third. In the class for six trebles, Mr. W. W. Wakeley was again first with fine blooms of Madame Gabriel Luizet, Duke of Edinburgh, Ahel Carrière—these were three magnificent blooms—Marie Van Houtte, and Louis Van Houtte. The Rev. H. B. Biron was second, and Mr. Hollingworth third. In the class for twelve varieties Mr. Stanley was first with a good box containing Général Jacqueminot, Thomas Mills, Souvenir d'Elise Vardon, Dr. Lovell, Henri Ledechaux, Maurice Bernardin, Dupny Jamin, Julie Touvais, La France, and François Michelin.

In the class for thirty-six varieties for nurserymen, open to all England, Messrs. Paul & Son of Cheshunt were first with a very fine stand containing a number of splendid flowers of François Michelin, Captain Christy, Henri Schultheis—a very fine flower, A. K. Williams, Alfred Dumesnil, Madame Isaac Pereire, Madame Hippolyte Jamin, Ulrich Brunner—a splendid bloom of a flower that has gained much in Rose cultivation lately, Marie Baumann

Lady May Fitzwilliam, Etienne L'vet, La France, Marguerite de St. Amand, Dupuy Jamain, Mons. E. Y. Teas, Abel Carrière, Madame Gabriel Luizet, Charles Lefebvre, Madame Prosper Laugier, Adolphe Rothschild, Reynolds Hole, Duke of Edinburgh, Magna Charta, Sénateur Vaisse, Violette Bouyer, Horace Vernet, Catherine Soupert, Beauty of Waltham, and Marie Baumann. Mr. B. R. Cant was second, and Mr. Prince third. In the class for twenty-four varieties, twelve Teas and twelve Hybrid Perpetuals, Messrs. Paul & Son were again first with La France, François Michelin, A. K. Williams, Ulrich Brunner, Camille de Rohan, Prince Artbur, Duchesse de Morny, Général Jacqueminot, Reynolds Hole, H.P., and Maréchal Niel, Sovenir d'un Ami, Catherine Mermet, Niphotos, Jean Ducher, Comtesse de Nadaillac, Sunset, Letty Coles, Ruhens (Teas). These were the best flowers on this very beautiful stand.

In the class for twelve Teas or Noisettes, open to nurserymen and amateurs in all England, Mr. E. Claxton of the Rosery, Allerton, Liverpool, took first prize with a beautiful box of blooms containing Princess of Wales, Madame Cusin, Jean Ducher, Caroline Kuster, Alba Rosa, Souvenir d'un Ami, Anna Ollivier, Marie Van Houtte, Etoile de Lyon, very fine; the Hon. Edith Giffard, very pretty; Comtesse de Nadaillac, and Souvenir d'Elise Vardon. Mr. Claxton also exhibited a very beautiful stand of Madame Cuzin, most brilliant and fresh in colour but a little rough. In the class for six of any one variety Canon Hodgson was first with a beautiful stand of Comtesse de Nadaillac, the most lovely I think of all Teas. In the class for six Roses, Miss C. Wake was first with Duke of Wellington, La France, Duchesse de Morny, Marquise de Castellane, Cloth of Gold, and Souvenir d'un Ami. Some very pretty stands of Roses with added foliage of Ferns and grasses were shown. The first prize was taken by Miss Welby, who also took the first prize for a basket, that adopted by the National Rose Society with a basket tastefully arranged. Miss Hawkesworth was second with one on which the flowers were better, but the arrangement was somewhat too lumpy. It should always be remembered by exhibitors that lightness and not heaviness should be aimed at; many a good stand is spoiled by neglecting this. I have seen stands otherwise very beautiful spoiled by having what I have no doubt the exhibitor thought were very beautiful but too heavy flowers being placed at the top, thus destroying all proportion between the top and bottom.

Such, then, was the first Show of the season; and while much credit is due to the indefatigable Secretaries, the Rev. H. B. Biron and Mr. W. Mount, for the excellence of their arrangements, great credit must be given to those exhibitors who, especially those in the neighbourhood, upheld the prestige of the Society, for which I hope there may be a prosperous career. Cathedral cities, as a rule, are slow in their movements; let us hope in this case it may be slow and sure.—D., Deal.

GERMAN IRISES.

WHAT Orchids are amid the denizens of stoves and greenhouses Irises are amongst hardy plants—quaint in form, if not grotesque, yet stately and graceful, and nothing in their season—late May or early June—approaching them in their colours or fragrance. They are, without exception, the most striking and the most ornamental of the many fine plants with which our herbaceous borders have been enriched of late years.

Irises, particularly the German or broad-leaved Iris, have yet to be given the place they are entitled to among hardy ornamental plants. Their broad ample foliage renders them very ornamental, and, when in flower, almost every shade of colour is found among them. Added to their beauty, another of their claims for general acceptance is their adaptability for almost every description of soil and situation, for they are very hardy and not at all fastidious. They will grow, indeed seem to luxuriate, where many plants do not—namely, in the smoky atmosphere of towns. It certainly is some years since I had experience of them in a town garden, but twenty years ago I found them among the very best of plants for early summer flowering near one of the largest manufacturing towns of the West Riding of York.

The shrubby border is not the place to see them at their best, as the soil is impoverished by the roots of the trees or shrubs, and too dry in summer, or when they are making and perfecting the growth. Margins of water, provided the water does not rise so as to convert the soil into a bog, will suit them, and the foot of a rockwork is an appropriate position, as they are not alpine but valley plants. They also come effectively in wild or natural arrangements of plants, particularly in a hollow, in which naturally there is an accumulation of vegetable matter, the *débris* of surrounding vegetation. Such positions, however, are only at the command of those with extensive domains, and those seeing them in such positions do not see them in anything like their best condition.

To see them in all their beauty an open situation is essential, and in a mass if it can be afforded, clumps or masses yards across being most effective; isolated plants are nevertheless very fine. The soil needs to be of a porous description, and yet sufficiently rich, or containing humus to sustain a vigorous growth. I have not seen them doing well in stiff clays, indeed I consider soil containing plenty of grit along with vegetable soil elements of their succeeding. Our soil is loam over gravel, but with a good dressing of well-decayed manure they do well and increase rapidly. Most soils, however, can be made to suit them, heavy soil by some opening material, and light soil by the addition of some moisture-holding and enriching substance. They do not like drought nor a wet sour soil.

They are increased by division, which may be practised in early autumn or early spring, the ground having previously been well and deeply stirred or trenched and liberally manured. Plant so that the rhizomes are covered about a couple of inches, and make the soil moderately firm about them, and allowing a distance of fully 2 feet from plant to plant; but I plant a yard apart every way, as the divisions are good, and this serves them about three years with space, when they

are ready for division. At this distance the plants send up flowering stems nearly a yard high, and the flowers are correspondingly fine. A mulch over the roots in winter is shown in the summer growths, and mulching and watering during dry weather in summer brings a reward in the endurance of the blooms with the foundation of a vigorous growth and flowering in the season following. To thin the growth after flowering when it has become crowded, removing the weak, and leaving the stronger only fairly thin so as to admit light and air for the solidification of the growth, is attended with good results in respect of a good bloom, nothing militating so much against flowering as the breaking up into a number of growths which have not room for development nor an opportunity of perfecting. Avoid crowding, feed liberally, and assign them an open situation in the full sun, but sheltered from winds.

The German Irises are particularly fine this year, the tropical heat of last season having no doubt ripened their growth unusually well, though the manure to which we treated them liberally has also in no small measure contributed. The species, *Iris germanica*, is a self, having purplish-blue standards and purple falls. This may be the progenitor of the many fine varieties we now possess, but as all the broad-leaved Irises pass under the broad title of *I. germanica* it is doubtful; indeed, we have varieties of several species included under that head, as among

Fig. 2.—Iris Gracchus. (See page 8).

aphylla, neglecta, pallida, squallens, and variegata, the last being a fine plant for isolated specimens on grass, and these are so intermingled as to be almost impossible of separation, though it may be noted in the flower or their marking, together forming a group of matchless beauty. Amongst the most noteworthy is the one chosen as representing the type—viz., *I. atropurpurea* (fig. 1, page 3), the flowers of which, both of its standards and falls, are rich purple—very fine indeed, and as sweet as Lily of the Valley. It is one of the earliest flowering, and one of the freest.

I. spectabilis is another purple self, and very desirable for its early flowering, it being one of the earliest, and is very free. *I. pallida dalmatica*, though not a true representative of *I. germanica*, is generally included in the broad-leaved Irises, and has very large flowers, being one of the best. The standards are lavender, the fall being also lavender tinged with purple. *I. pallida speciosa* is a very deep purple or violet self, and very beautiful. *Othello* is another purple self of a very rich shade of blue. Chameleon, with its deep blue standards and violet falls veined with white, is very attractive. Celeste is a lavender self, albeit it has an orange beard; and Madame Paquette has reddish purple standards and rosy purple falls, very fine.

Some of the varieties have a bronze or metallic lustre, some of which are:—Mozart with brownish bronze standards and purplish bronze falls, the flowers are very large; Phidias, standards bronze, falls coppery crimson, veined white and orange; Socrates, bronze tinged with purple standards, falls violet reticulated with purple, large and fine.

In fine contrast to the above are the yellows; one of the finest is Gracchus, of which the engraving (fig. 2) is a faithful representation, the standards being lemon or yellowish white, falls pale yellow and richly marked or reticulated with purplish crimson. It is dwarf in growth and free flowering, well deserving the first-class certificate recently accorded to it by the Royal Horticultural Society. I. aurea is a golden yellow self, fine; and very effective is Hericart de Thury, its chrome-yellow standards and plum-coloured falls reticulated with sulphur or white rendering it very conspicuous. Flavescens, a primrose yellow self, has very large flowers, being very fine. Magnet has rich bright yellow standards, the falls purple reticulated white, whilst Hector has yellow standards and brownish red falls stained with purple.

In white forms, which are always appreciated, we have the very beautiful feathered variety represented in the engraving (fig. 3)—viz., Madame Chcreau, white, edged and feathered with violet, rendering it quite charming, and it flowers very freely. Scarcely less lovely is L'Innocence, pure white self, only there is a very chaste reticulation of purple and gold. It is very fine, indeed exquisite. Calypso has white standards and purple falls, distinctly reticulated white. I. florentina, a white self, is very desirable for its free flowering, and delicious fragrance. Poiteau is white tinged with lavender in its standards, the falls deep purple reticulated white, a fine large flower; and Victorine has the white standards blotched with blue, the falls violet purple, veined with white.

In fancy colours we have rosy lilac standards and purplish crimson falls, margined and reticulated with white in Cordelia, and Queen of May affords rosy-lilac in both standards and falls, the latter veined yellow, which render it very distinct and fine; Duke of York has fawn standards, and purplish-violet falls with white margin; Sir Garnet Wolseley's standards are white flaked purple, falls crimson and white.—G. ABBEY.

[The flowers shown in the engravings were supplied by Mr. T. S. Ware, Tottenham.]

BROCKHAM ROSE ASSOCIATION.

THE twentieth Brockham Rose Show was held on Saturday, June 27th, at Burford Lodge, near Dorking and Boxhill, the country seat of Sir Trevor Lawrence, Bart., M.P., and Lady Lawrence.

It was rather too early a date for every Rose-grower, considering the unfavourable weather of June, but for many it was positively impossible to show anything, and so some of the well-known exhibitors, who have helped to make this renowned Rose Show (which is the parent of so many other shows) what it is, were able to do nothing. However, it surprised Judges and everyone to see so good a Show. Of sixty-one members twenty-six were represented as exhibitors, and there were eighty-one entries, well arranged, and showing that general improvement in the growth of the Rose which it is the object (or should be) of every such association to encourage. There was not one really bad box, so much have the "good old (Brockham) times" changed, and the setting up, and consequent showing off, of the flowers was the rule rather than the exception.

All the classes but one were represented, especially the twelves and Teas, and there was a desirable evenness in the competition this year which ought to encourage shy exhibitors; for it is a discouraging thing to compete with "giant" Rose-growers, and the continued carrying away of "all the prizes" (which is the term generally in use at shows) by one or two members is very apt to weaken the Association and lessen the interest taken in it. Of the devices and decorations it is possible and right to speak in terms of praise. The number of entries was greater than usual, and the drawing-room decorations were both graceful and in some cases striking, notably that which won for Mrs. Fowke the first prize, and Lady Lawrence an extra prize.

The Judges were two old friends, Mr. George Paul (Old Nurseries, Cheshunt) and Rev. A. B. Alexander, with the addition of Mr. Fred. Pawle, Secretary of the Reigate Association. Their decisions were by no means easily obtained, but in every case were unanimous. The selection of the best Hybrid Perpetual gave the most difficulty, for there was no really "grand" bloom to settle the question off-hand.

An hour's idleness before the judging began gave the opportunity of looking round the garden and the greenhouses. It is difficult to say too much of the courtesy, kindness, and patience of Sir Trevor Lawrence, the popular and hospitable owner, who personally went round the very numerous houses, and pointed out many of the wonders and beauties in his collection of Orchids, which are of world-wide reputation. A description of Burford Lodge has appeared in a previous number of this Journal. Of course the Orchids were as a rule out of bloom, but there were exceptions amongst the Cattleyas, Cypripediums, Lælias, Oncidium, Saccolabiums, and Masdevallias, Odontoglossum Alexandræ, Dendrobiums, several of which, with Anguloa Ruckeri, Promeneia stapelioides major, Aerides expansum, Odontoglossum vexillarium superbum, and an extraordinary little Masdevallia of port wine colour, wonderfully marked, impacta purpurea. There was a large number, too, of splendid double Tuberous Begonias, for which Sir Trevor Lawrence is famous, and many specimens of Anthuriums, and a strange hybrid red and white streaked specimen, A. Rothschildianum; also Salvia carduacea (Thistle Salvia), and a curious and rare Australian trailing plant, with flowers like rabbits' tails, Trichinium Manglesi. But it is not the "houses" only for which Burford Lodge is renowned. More ordinary plants are grown with equal care. Nothing is crowded, and yet the variety is very great. There are large beds of Alstroemerias of all colours, Tree Pæonies, Gladioli, Aquilegias, single Dahlias, Carnations (a splendid pure deep yellow Tree Carnation of great size greeted us as we entered the large conservatory), besides Roses in profusion, Spiræas, &c. It is certainly a glorious

garden, and, sheltered under the perpendicular ridge of Box Hill, must escape many dangers from wind and frost.

At twelve the tent was cleared, and the Judges went to work with the following results:—For twenty-fours Rev. Alan Cheales took the first prize for A. K. Williams, Maréchal Niel, C. Lefebvre, Earl of Pembroke, Gloire, Duchess of Bedford, Niphetos, Duke of Teck, Marie Baumann, Duke of Wellington, La France, Madame Berard, Louis Doré, Jean Ducher, Duke of Edinburgh, Dr. Sewell, Souvenir d'Elise, Sultan of Zanzibar (the best H.P. in the Show), Caroline Kuster, Marguerite de Roman, Helen Paul, Prince Arthur, The Baroness, and Cheshunt Hybrid. It was a grand box, and very near came the box of Lady Lawrence, who won the second prize with Reine Marie Henriette, Crown Prince, Duchess of Bedford, Cheshunt Hybrid (Tea), A. K. Williams, Catherine Bell, Duke of Edinburgh, Souvenir d'un Ami, Princess Beatrice, General Jacqueminot, Madame Montet, Marquise de Castellane, La France, Charles Lefebvre, Earl of Pembroke, Sultan of Zanzibar, John Hopper, Anna Olivier, John Bright, Gloire de Dijon, Dnpy Jamain, Madame M. Rigat, Firebrand, and Souvenir de Malmaison. An extra prize was awarded to Mr. Cuthell. For the twelves Mr. E. Horne won the first prize with Charles Lefebvre, Marquise de Castellane, Annie Laxton, Elie Morel, Abel Carrière, Marie Baumann, Marie Van Houtte, Magna Charta, Captain Christy, Duke of Teck, and Maurice Bernardin. The second prize went to Mr. Wylie, and the third to Mr. Wm. Praed. For the sixes the Hon. H. D. Ryder carried off the first prize with Mons. Noman, Catherine Mermet, Maréchal Niel, La France, Captain Christy, and Abel Carrière. Mr. Thompson took the second prize, and Mr. Leopold Seymour an "extra." Seven exhibitors competed for the triplets (four of each). Mr. Cheales took first prize for Maréchal Niel, Charles Lefebvre, A. K. Williams, and Marie Baumann. Lady Lawrence came next with Duchess of Bedford, Souvenir d'un Ami, A. K. Williams, Cheshunt Hybrid (Tea), and Mr. Horne third "extra" with Baron N. de Rothschild, Madame Bravy (grand bloom), Charles Lefebvre, and Cheshunt Hybrid.

Lady Lawrence and Mr. Leopold Seymour took first and second prizes respectively for six blooms of one kind, Lady Lawrence's La France being splendid blooms. Mr. Cuthell had an "extra" for his Gloire de Dijon, fine but uneven. In the class of twelve Teas there were five exhibitors, and the boxes of each were decidedly good. Mr. Horne, Mr. Cheales, and Mr. C. G. Stone divided the honours between them. In Mr. Horne's box, which was first, there were Jean Ducher, Madame Bravy, Maréchal Niel, Souvenir d'un Ami, Climbing Devonensis, Anna Olivier, Marie Van Houtte, Rêve d'Or, Madame Welch, Gloire de Dijon, Comtesse Ouvrart, and Madame Marie Arnaud; while Mr. Cheales showed Bouquet d'Or, Mons. Furtado, Duchess of Edinburgh, Maréchal Niel, Jean Ducher, Homère, Niphetos, Catherine Mermet, Madame Cusin, Madame Berard, Souvenir de Therese Levet, and Souvenir d'un Ami. Mr. Stone showed M. Marie Arnaud, Boule d'Or, Niphetos, Gloire de Dijon, Souvenir d'Elise, Belle Lyonnaise, Rubens, Madame Lambard, Duke of Edinburgh, Comtesse Riza du Parc, Alba Rosea, and Souvenir d'Elise. Mrs. Barclay won the first prize for the following six Teas:—Madame de Tartar, Madame Willermoz, Devonensis, Madame Bravy, Souvenir d'un Ami, and Annie Sisley. Mr. Birkett won the second prize in this class, for which there were nine competitors. Mr. W. Cattley was the only representative in the class for previous non-winners, showing six separate Roses, and taking the prize. Mrs. Mortimer won the gold medal for her beautiful box of Souvenir d'un Ami, Mr. Thompson and Mr. G. Stone being second and third with Bouquet d'Or and Souvenir d'un Ami respectively. There were ten competitors in this class. As aforesaid, Mr. Cheales took the silver-gilt medal of the National Rose Association for the best Hybrid Perpetual Sultan of Zanzibar, and Mr. Mortimer took the silver medal for the best Tea, a grand bloom of Souvenir d'un Ami.

The decorations for the dining table were wanting in variety of colour and foliage. Mrs. Cuthell took the first prize for a tasteful arrangement in a glass basket on a mirror, and Mrs. Birkett took second prize. The drawing-room devices attracted much notice, and were for the most part very gracefully arranged. The first prize went to Mrs. Fowke for a very uncommon and elegant device in a high glass vase filled with white Poppies, the Bride Gladiolus, and White Canterbury Bells, with Ferns and Grasses. Mrs. Birkett took the second prize for a particularly neat and tasteful decoration, and Lady Lawrence for a high vase arranged with white Pæonies took an "extra." The buttonhole bouquet prizes went to Miss Horne, Miss Tritton, and Mrs. Praed.

Mr. George Paul, Cheshunt, brought a very fine collection of new and other Roses, comprising Marguerite de Roman, Helen Paul, H. Schultheis, B. de Rothschild, Alphonse Soupert, Violette Bouyer, Grace Darling, Long-fellow (a purple Chas. Lefebvre), Comtesse de Paris, Madame de Watteville (new Tea), Colonel Felix Breton, Lady of the Lake, Pride of Reigate, William Warden, White Baroness, Madame Alice Van Geert, Sunset (new Tea), Maréchal P. Wilder, Lady M. Fitzwilliam, and R. C. Sutton. Mr. Appleby of the Box Hill Nurseries also showed a fine collection of Tea Roses, Gloxinias, and other plants; and Mr. Girdlestone, an amateur of Sunningdale, brought a very fine collection of new Roses, amongst which were Mons. Alfred Dumesnil, Catherine Soupert, Prefect Limberg, Violette Bouyer, Crown Prince, Souvenir de Gabrielle Drevet, Duke of Albany, Alphonse Soupert, Gloire de Bourg la Reine, Madame Montet, Dr. Hogg, Grace Darling (Bennett's Tea), Glory of Cheshunt, Henrich Schultheis, Edith Giffard (new Tea), Antoine Mermet, Melanie Soupert, White Baroness, Perle d'Or, Mary Pochin, Madame de Watteville (Tea), Sunset (Henderson, New York), and Marie Pare, a Hybrid Tea.

The Committee and Judges were entertained at luncheon by Sir Trevor and Lady Lawrence, and there was a very large gathering at the Show, the attractions being numerous and the weather magnificent. The band of the Royal Engineers, under the able leadership of Herr Sawerthal, played sixteen pieces of well-known music under the trees on the wide lawn. Next year the Brockham Association reaches its "majority." It may be truly said that it is much more vigorous now than it ever was, and the Treasurer and the Secretaries seem as young and energetic as ever. Rose-growing is for all classes, and seems particularly suited to all who want to get away from cares. The names of many country clergymen are known as Rose-growers. It is a "country parson's recreation" which no one would deny to him. A lad, on being asked what he should like to be when he grew up, said, "I should like to be a clergyman and grow Roses." The lad

knew no better. He might well have made a worse choice.—A. B. ALEXANDER, *Shedfield Vicarage*.

RICHMOND SHOW.

FAVOURED by exceedingly fine weather the Richmond Horticultural Society held their annual summer Show last week (June 24th) on the usual site—the Old Deer Park—and again large numbers of exhibitors and visitors were attracted to what is invariably one of the most satisfactory of suburban shows. In some of the classes the competition has been keener in previous years, and there were not quite so many miscellaneous non-competing groups, yet there was abundance of well-grown produce—plants, fruit, and vegetables, to which three marquees were devoted. That appropriated to plants was one of the largest (240 feet long by 60 feet wide) and most handsome we have seen, and only needed Mr. Cypher's giant specimens to have rendered its appearance all that could be desired. Unfortunately, however, there was a lack of large plants, such as were required to form the central back in a marquee of such dimensions, and in consequence it did not seem well filled. A central line of tall Palms would have served to remove somewhat of this appearance, and had the stove and greenhouse plants occupied a more prominent position near the entrance they would have still further assisted in the improvement. In all other respects the arrangement and general management of the Show were all that could be wished, the Committee having rendered their courteous and energetic Secretary, Mr. Ford, much assistance in his arduous duties.

Plants.—One of the chief features of this Show for several years past has been formed by the groups in competition, and some extremely tasteful productions have been seen there, especially from Mr. Hudson, who set an example in grouping that has been successfully followed by many others since. The great fault with the majority of groups, and it also applies to floral decorations generally, is too great a heaviness, and those engaged in this work appear slow to realise the fact that the best effects are produced by the graceful disposition of a few light plants or flowers, with the colours harmonising rather than violently contrasting. Bold masses of brilliant colours are only suitable where effects have to be viewed from a distance; for near inspection quieter results are much more satisfactory. In the nurserymen's classes Messrs. Cooper & Co., Covent Garden, secured first honours for a charming group such as their manager, Mr. Bruckhaus, has so frequently staged on previous occasions. There were central Palms and tall Dracenas, with a prominent plant of *Croton Andreanus* beautifully coloured; a groundwork of Ferns, amongst which were interspersed *Gloxinias*, *Disas*, *Tuberous Begonias*, and the useful little *Caladium argyrifolius*. The whole was neatly margined with *Cyperus variegatus*, *Isolepis*, and *Panicum*. Messrs. W. Fromow & Son, Chiswick, were, after some consideration on the part of the Judges, placed second with an admirable group, but scarcely sufficiently well filled, and the employment of a few more Ferns in the foundation would have been advantageous. Orchids were liberally used in this group, *Dendrobiums*, *Oncidiums*, and *Cattleyas* being very showy; but the most effective of all were the *Saccolabiums*, of which the curving spikes of purple and white flowers were most beautiful. *Lilium longiflorum* was also employed with excellent effect, a bold central plant of the variegated *Pine Apple* and a neat margin of small Ferns finishing a bright, varied, and pretty group. Mr. H. James, Castle Nursery, Lower Norwood, was third with a rather heavier but effective group, in which *Hydangea paniculata*, *Chrysanthemum frutescens*, and numerous Orchids were the chief materials.

In the gardeners' class the competition was also close, the principal exhibitors being Mr. G. R. Geaves, Hatfield House Gardens, Cambridge Park, J. Wigan, Esq., Mr. Chadwick, and Mr. Bowell. Mr. Geaves had a graceful combination of Ferns, *Gloxinias*, *Cockscombs*, and *Coleuses*, with taller *Crotons*, Palms, and *Lilium auratum*. Mr. Wigan showed some choice Orchids in his group; both Mr. Chadwick and Mr. Bowell also exhibited well.

The principal collections of stove and greenhouse plants were the two entered in the class for nine from Messrs. T. Jackson & Son, Kingston, and Mr. H. James, Lower Norwood, who were placed respectively first and second. The Kingston specimens were even, fresh, and well flowered, the most notable being *Dracophyllum gracile*, *Erica Dennisoniana*, *Pimelea mirabilis*, *Franciscea calycina*, and *Clerodendron Balfourianum*. Mr. H. James's plants have been frequently seen before this season, but *Allamanda grandiflora* and a *Stephanotis* were in excellent condition. With six plants Mr. Bates, Poulett Lodge Gardens, Twickenham, took the lead with *Sobralia macrantha*, *Bougainvillea glabra*, *Allamanda Hendersoni*, *Cattleya Mossiae*, and *Dipladenia hybrida*, all in capital health. Mr. Bowell was placed second, his best plant being a large *Oleander* well flowered. The *Pelargoniums* from Messrs. H. Little and W. Clay added much to the beauty of the large marquee, and the large group of seedling *Pelargoniums* raised by Mr. Wiggins occupied a prominent position. Messrs. James, Jackson, and Little were the exhibitors of Orchids and the prizewinners in that order, Mr. James having large masses bearing an abundance of flowers: his *Cattleyas* and *Epidendrum vitellinum* were particularly showy. Messrs. Jackson's *Dendrobium suavisimum* with two dozen spikes was handsome, and Mr. Little's *Dendrobium Dearei* with thirteen spikes, some having ten flowers each, was one of the best examples of this pretty Orchid that has been exhibited. Palms, Ferns, *Caladiums*, and miscellaneous plants were fairly represented, but were not of remarkable merit. The principal prizes were won by Messrs. Hooper & Co., Bates, Bowell, East, Munro, Wheeler, Chadwick, and Sallow.

Cut Flowers.—These were not quite so numerous as usual, and the competition with Roses was much less keen. Messrs. Paul & Son were the premier exhibitors of thirty-six and twenty-four blooms; Mr. Mitchell, Rainham, Essex, having the best twenty-four H.P.'s and the best twelve Teas; T. W. Girdlestone, Esq., following in the former class and J. P. Kitchen, Esq., Hampton, in the latter. All the blooms were fresh, but Messrs. Paul's were of excellent substance and exceedingly rich in colours. Mr. J. R. Chard, Clapham Common, was the most successful exhibitor of flower vases and bouquets, the vases being light and graceful, but the bouquets were too crowded to be satisfactory, and a similar remark applies to nearly all the bouquets shown. There was good competition for the

table decorations, Mr. Thos. Butcher, South Norwood, securing the first prize given by Lady Ellis for a light tasteful arrangement, in which white *Begonias*, *Rhodanthes*, white *Iris*es, *Tuberous Begonias*, and *Odontoglossums* with *Lygodium* fronds, formed the chief features. Mr. J. R. Chard followed. Two other contributions from ladies were commended, but in both these the mistake had been made of attempting too much, and the tables had a heavy appearance that could please but few.

Fruit.—Several exhibitors staged praiseworthy samples of fruit in these classes. For six dishes of fruit Mr. Munro secured the lead, having Black *Hamburgh Grapes* of good colour, *Elruge Nectarines*, Best of All *Melon*, Sir Joseph Paxton *Strawberry*, *Negro Largo Figs*, and *Grosse Mignonne Peaches* (large). Mr. Bates was a close second, his Black *Hamburgh Grapes* being finely coloured. Mr. Osman, Ottershaw Park Gardens, Chertsey, had the finest Black *Hamburgh Grapes*, large in bunch and berries, and handsomely coloured, Messrs. Feist and Bates following. Mr. Osman also took the lead in the white *Grape* class, having *Buckland Sweetwater* very large, and was followed by the same exhibitors as in the previous class with *Muscat of Alexandria* and *Foster's Seedling*. In a local class Mr. Bates was first with three bunches of *Alicante Grapes*, well coloured, and Mr. Coombs

Fig. 3.—*Iris Madame Chereau*. (See page 8.)

obtained the same position in the corresponding white variety class with *Muscat of Alexandria*.

Vegetables were extremely fine, the premier collection of twelve sorts from Mr. C. J. Waite, gardener to Col. the Hon. W. P. Talbot, Glenhurst, Esher, deserving every praise. Mr. Coombs also competed very closely. Messrs. Sutton's prizes for Cucumbers were won by Messrs. E. R. Geaves, F. Wigan, and J. Atkins.

The principal non-competing exhibits were groups of plants from Messrs. Jackson & Son; Lee & Son, Hammersmith; J. Vander Rees, Tooting; J. Laing & Co., Forest Hill; and R. Drost, Kew Nursery.

CHERTSEY DISTRICT HORTICULTURAL SOCIETY.

FOR twenty years this Society has been established and greatly contributed to the excellence of the gardening in one of the most pleasant parts of Surrey. The annual exhibitions of the Society are held in different places, some gentleman usually, if not invariably, placing his park or grounds at the disposal of the Committee—an act of generous kindness that is appreciated by managers and visitors alike. The last Show, and probably

the best, was held in Ashley Park, Walton-on-Thames, the seat of J. S. Sassoon, Esq. The Tudor mansion is an interesting, even an historical old building, for it was once occupied by the famous Cardinal Wolsey. At present one side of it is clothed with venerable Magnolias, and the pleasure grounds and park are well timbered with trees old and young, and the entire surroundings of the mansion kept in beautiful order by Mr. Sutton, the gardener.

The Exhibition was held in three marquees in the Park—one, very large, accommodating the specimen plants, another wholly occupied with groups arranged for effect, a third containing fruit, cut flowers, and vegetables, and the competition was highly creditable in every department. No pretence will be made to give anything like a detailed report of the Show, a glance at its leading features being all that is practicable.

In no section was the interest keener than in the effect groups, for which special prizes were offered, and in no classes did the Judges experience greater difficulty in granting the awards. Two classes were provided, one for semicircular groups 14 feet by 7 feet, the other for similar groups 10 feet by 5 feet, arranged on the ground. In the former class the first prize was won by Mr. R. Caute, gardener to J. P. Robinson, Esq., Brookleigh, Esher, with a bright, light, and beautiful arrangement. Associated with Palms and other foliage plants were *Lilium auratum* and *umbellatum*, Tuberous Begonias and Campanulas, with graceful *Humeas* drooping over all, the front being well finished with Ferns, Gloxinias, and *Panicums*, not a pot being visible, yet no semblance of overcrowding. Mr. Sutton, gardener to J. S. Sassoon, Esq., was a close second with a similar arrangement, in which some scarlet *Pentstemons* had a pretty effect; and Mr. Wakefield, gardener to E. Pettit, Esq., Bowater, Oatlands Park, third, with a rich floral mass, but somewhat crowded. In the smaller groups, in which the first and second prizes were given by the President of the Society, G. F. Wilson, Esq., the competition was even more keen. After a deadlock, only relieved by the retirement of a Judge, the first prize was awarded to Mr. Plowman, gardener to C. L. Lavers Smith, Esq., Oakfield, Walton, with a well-finished arrangement of good plants; a groundwork of Ferns with healthy *Dracenas* and Palms rising above them, the back brightened with scarlet *Liliums* and the front margined with *Lobelias* and *Isoplexis*. Mr. Millican was placed second with a charming arrangement, and but for the weak margin and visible pots of *Lobelias* he must have had a higher place. Mr. Frankis, gardener to J. W. Wilson, Esq., Oatlands Park, was third with an extremely pretty arrangement of *Saxifraga pyramidalis*, Canterbury Bells, and Palms; Mr. Reeve, gardener to W. Hewitt, Esq., Templemore, having the fourth place with a highly meritorious assortment.

In the large tent a brilliant feature was a collection of plants from Messrs. T. Jackson & Sons, Kingston, which included splendidly flowered Orchids, Heaths, and other hardwooded plants and a few choice Gloxinias. The best six stove and greenhouse plants were staged by Mr. Wakefield. *Erica ventricosa alba*, fresh and good; two *Azaleas*, *Stephanotis*, very fine; a *Rhynchospermum*, and *Dracophyllum*. In the class for four plants Mr. Plowman was to the fore with a *Kalasantbes*, *Clerodendron*, *Rhynchospermum*, and *Stephanotis*, all in splendid condition. Mr. Reeves had the best specimen flowering plant, a bright and healthy example of *Erica Cavendishiana*. Mr. Caute secured the first prize for four Ferns, excellent examples of culture; and he staged a brilliant example of *Acalypha tricolor*. Mr. Child had the best *Fuchsias*—columnar plants 6 feet high, with pendant sprays of fine flowers and clean foliage; also the best Begonias and *Achimenes*. *Caladiums*, very fine indeed, won first honours for Mr. Reeve. Mr. Carpenter staged admirably grown Gloxinias; Mr. Millican, *Liliums*; Mr. Reed, Orchids; and Messrs. Bennett & Reeves, *Pelargoniums*. Most or all of the exhibitors named also secured prizes in other classes.

Fruit was of good average quality. The prizes for black Grapes were won respectively by Messrs. Osman, gardener to L. J. Baker, Esq., Otter-shaw Park; Sparrow, gardener to Rev. A. Bramwell, Barrow Hills; and Frankis, gardener to J. W. Wilson, Esq., Oatlands Park. Mr. Osman was first with white Grapes, very fine Buckland Sweetwater; Messrs. Sparrow, and Frankis being second and third with Foster's Seedling, ripeness, not size, being favoured by the Judges. The last-named exhibitor staged the best Melon in the Show—Read's Scarlet-flesh—the best green flesh being Hero of Lockinge from Mr. Child. Mr. Sparrow had the best Peaches, apparently Gros Mignonne; and Mr. Wakefield the best Nectarines—Lord Napier. By far the finest Strawberries in the Show were exhibited by Mr. T. Sparke, Knole Hill, the variety being Marguerite; and Mr. Sutton won the prize for a collection of fruit.

Very good stands of Roses were staged by Messrs. Sparrow, Carpenter, and Bennett, who were awarded the prizes respectively. Mr. Millican out-distanced all competitors with dining and drawing-room epergnes. Trusses of ripe Strawberries with *Deutzias* rising from the base of the former, purple Sweet Peas at the top, the latter being finished mainly with scarlet Sweet Peas, White Roses, and pink Begonias. The successful exhibitors of table plants were Messrs. Caute, Sutton, and Reed.

Vegetables were in great force, Mr. J. Waite, gardener to Col. Hon. W. P. Talbot, Esher, securing the first prize with a collection comprising splendid dishes of Onions, Artichokes, Asparagus, Cauliflowers, Potatoes, Carrots, and Tomatoes, Messrs. Child and Sparrow following with most creditable produce.

A good deal more might be said about this excellent Show if space permitted, but a line must be found to record a presentation—an article of silver at the luncheon to Mr. Thomas Rawlings in recognition of his valuable services as Secretary to the Society since its formation in 1865.

PRUNING ORCHIDS.

THE remarks recently made in your columns by Mr. Prinsep and "A Thinker" anent the pruning system are supremely ridiculous. They both exclaim because the opponents of that system, and particularly Mr. Baines, required that a pruned Dendrobe should be exhibited in London before they could accept Mr. Prinsep's assertions as conclusive. Personally I fail to see any just cause for complaint. London is not only the largest and richest city in the world, but is the capital of this kingdom, and, I might add, of Europe. London holds the same position in this

nineteenth century which Paris held in the eighteenth, and everyone who wishes to advance a new theory or make a name must come here to have his pretensions investigated by experts in his department of human intelligence.

When Mr. Crookes startled the scientific world with the announcement of his discovery of the radiometer, many sceptics arose, yet I never heard that he considered himself aggrieved when asked to exhibit his extraordinary little instrument before the Royal Society. Again, were the Australian cricketers offended at being invited to show us their quality on our metropolitan ground? Quite the reverse, they were delighted at the opportunity afforded them of proving that they were as good, if not better, men than ourselves.

Every innovator and every discoverer must be prepared to encounter a certain amount of incredulity until time has proved the soundness of their views, and there is not the least reason why Mr. Prinsep should be any exception to this rule. He has stumbled upon a discovery which is opposed to all the teachings of Nature; so opposed indeed, that had he lived in old days under the Inquisition and dared to propound his new theory, he would probably have found himself in durance vile. As it is, he need now only wait a few months until Orchid growers have had an opportunity of testing his practice, when, if it succeeds, one and all will, I am sure, be quite ready to accord to him the honour which is his due. Of course if others cannot make the pruning system answer it must be relegated to that large lumber room where hundreds of other fads have gone before.—B. D. KNOX.

MAIDSTONE ROSE SHOW.

THE annual Exhibition of the Maidstone Rose Club was held in the Concert Rooms on Monday, and although not equal in extent to the Canterbury Show, owing mainly to the fact that there are no prizes open to all England, and consequently the large growers, Messrs. Paul, Cant, and Prince, who showed so strongly at Canterbury, were not there, yet a very good collection of Roses from amateurs was shown, and the competition was keen and spirited; but taken altogether I do not think that the quality of the flowers was as good as in the Cathedral City. The devices were better, and the prizes for shoulder knots brought together a good competition, while the prize for garden Roses introduced a novelty which was very pleasing, and which I hope to see still more largely shown at the National on the 7th.

In the class for twenty-four distinct varieties, twelve Hybrid Perpetuals and twelve Teas or Noisettes, the prizes were awarded to Captain Knight, Mr. W. H. Wakeley and Mr. John Hollingworth. The competition was very close between the first and second stands. Captain Knight's Roses were Henri Ledechaux, Marquis de Sauria, Exposition de Brie, Madame Hippolyte Jamin, Belle Lyonnaise, Marie Rady, Marie Van Houtte, Souvenir d'un Ami, Madame Furtado, Horace Vernet, Laurette, Anna Ollivier, Comtesse de Nadaillac, Louise de Savoie (a very beautiful Tea, rarely seen), Duke of Edinburgh, A. K. Williams, La France, Catherine Mermet, Captain Christy, Madame Willermoz, Charles Lefebvre, Eugène Furst, and Madame Marie Finger.

In the class for eighteen, distinct, Mr. R. E. West was first with a beautiful box, containing La France, Eugène Furst, Madame Gabriel Luizet, Marie Baumann, Violette Bouyer, François Michelon, Marquise de Castellane, Mary Quennell, Merveille de Lyon, Alfred Colomb, Helen Paul, Duke of Teck, Duke of Edinburgh, Ulrich Brunner, Abel Carrière, Baroness Rothschild, A. K. Williams, and Duchesse de Valombrosa. Mr. H. Foster of Ashford was second with a good stand, containing amongst others a bloom of A. K. Williams, which obtained the bronze medal of the National Rose Society for the premier bloom in the Show. Mr. J. Hollingworth was third in the class for twelve. Mr. R. E. West was again first with a perfect box, which also obtained the National Rose Society's silver medal for the best box in the Show. Irrespective of numbers it contained La France, Louis Van Houtte, Baroness Rothschild, Madame Gabriel Luizet, A. K. Williams, Countess of Rosebery, Duke of Edinburgh, Marie Van Houtte, Marguerite Brasseac, Marquise de Castellane, Abel Carrière, Violette Bouyer. The Rev. H. B. Biron was second.

In the class for nine Mr. J. M. Fuller was first with Duke of Edinburgh, Marie Finger, Prince Arthur, Madame Hippolyte Jamin, Charles Lefebvre, Marguerite de St. Amand, Etienne Levet, Madame Gabriel Luizet, and Marie Baumann.

In the class for six trebles Mr. W. H. Wakeley was first. His box contained good blooms of Abel Carrière, Louis Van Houtte, Madame Gabriel Luizet, &c.

In the class for six varieties Mr. Fuller was again first with Marquise de Castellane, La France, Dr. Andry, Marie Finger, Madame Gabriel Luizet, and Marie Baumann.

In the class for twelve Teas Mr. John Hollingworth was first with Caroline Kuster, Madame Welsh, Marie Guillot, Perle des Jardins, Bouquet d'Or, Catherine Mermet, Souvenir d'un Ami, Comtesse Parnesse, Belle Lyonnaise, Anna Ollivier, Madame Jules Margottin, and Souvenir de Pané Neyron. Captain Knight was second, and the Rev. H. B. Biron third. His box was noteworthy for containing a very beautiful seedling raised by Mr. Hossack, gardener to the Marquis of Conyngham at Bifrons, called Lady Conyngham, but it was unfortunately too like Catherine Mermet to be classed as distinct from that fine flower.

In the class for six Teas Messrs. Ashhurst & Tucker were first with Marie Van Houtte, a very beautiful hunch of Rêve d'Or, Souvenir d'un Ami, Anna Ollivier, Catherine Mermet, and Belle Lyonnaise.

In the class for six of the same variety Mr. R. E. West was first with Madame Gabriel Luizet, Mr. Wakeley second with Gabriel Luizet, and Messrs. Ashhurst and Tucker third with Gloire de Dijon.

In the class for six Teas, three of each, Captain Knight was first with Madame Hippolyte Jamin, Souvenir d'un Ami, Madame Furtado, Laurette, Marie Van Houtte, and Madame Liabaud.

In the class for twelve bunches of Moss, Provence, or Hybrid China Roses Mr. A. J. Killick was first with York (a white Rose), Lancaster (a red),

and York-and-Lancaster (striped), true, and supposed to be between the two former. I have never seen these before, and should be glad to know if some light could be thrown on this interesting subject—Charles Lawson, the old Cabbage, Maiden's Blush, Coupe d'Hébé, White Moss, Seven Sisters, Blairii No. 2, and Crested Moss.

The prize given by Mr. John Hollingworth, value five guineas, for the best stand of Roses combined with Ferns or other foliage, was won by Mrs. H. B. Biron with a stand arranged in her usual good taste, and clearly showing that her hand had not lost its cunning. The second was taken by Miss Bensted; Miss Lawrence was third, and Miss Henwood fourth. In the class for shoulder knots Mrs. Robert Knight was first, Mrs. Biron second, Miss S. Mercer third, Mrs. H. White fourth, and Mrs. H. A. Hughes fifth. In buttonhole bouquets there was a keen competition, and most of them exhibited much simplicity and good taste. Mrs. Tatham was first, Mrs. H. White second, Miss Henwood third, Mrs. Knight fourth, and Mrs. S. Mercer.

I may add that it was to all lovers of the Rose a great pleasure to see that veteran rosarian Mr. John Hollingworth quite himself again, and bearing no trace of the severe illness which caused so much distress to his many friends. He was as keen and as hearty as ever.—D., Deal.

HARDY FRUIT GARDEN.

STRAWBERRY time has come again, later than usual it may be, but never with greater abundance of this wholesome and popular fruit. The late season has caused ripe fruit of the early sorts to be eagerly sought after and more highly prized than usual, and where special provision had been made to obtain early fruit in the open air such care has been well rewarded. Now is the time to see if there are any faults in our method of culture, and to strive to obtain clear knowledge of the cause of failure and its remedy. In the second week of June we saw a very steep and high bank in a railway cutting, upon which there was a Strawberry bed with ripe fruit clustering thickly upon the plants. Let the lesson conveyed by the tempting sight be turned to general account. It is true that we cannot have railway cuttings in our gardens, but we may contrive some banks with a high slope at an acute angle in many a snug sheltered corner facing the south-west. We have previously called attention to the importance of some such plan, as well as of planting large beds of late sorts under standard fruit trees and near high walls facing the north to retard the ripening of the fruit as much as possible, so as to prolong the season of ripe fruit by every means in our power. Never waste valuable space upon inferior sorts. We have so many really excellent varieties now that there should be no difficulty in making a selection to suit every garden, and to this important end we strongly recommend our own plan, which is to procure a dozen plants of each new sort, and to make little trial beds so as to test them fairly with older varieties. Certainly space could be found for such trial beds in all large gardens, and it is the only safe way to ascertain the real value of any sort, and to obtain the best.

Repeatedly have we advised our readers not to dig between Gooseberry bushes after they are established in the soil, and to apply manure as a surface dressing only. By this treatment the roots are preserved from laceration, and, being drawn to the surface by the manure, health and vigour of growth is ensured. The merit of economy of labour may also be claimed for it, and the still more important one of immunity from the attacks of the Gooseberry caterpillar. A grower of Gooseberries by the ton has recently called attention to this fact as of vital importance to fruit farmers. He tells how a considerable sum of money was spent upon planting several acres of Gooseberries, how careful he was to break up the soil well annually between the bushes, how the foliage was eaten by caterpillars to such a serious extent that growth was checked. Hand-picking, dusting with lime and hellebore powder, were all tried and found ineffectual, when, with failure apparently inevitable, he one day happened to turn from his almost leafless bushes to look over the enclosure of a neighbour, where, to his agreeable surprise, he saw Gooseberry bushes untouched by caterpillars, and found it was simply owing to the hard surface of the undug soil affording them no protection during winter. The hint was turned to account; there was henceforward no more digging between Gooseberry bushes, and no more caterpillars.

FRUIT FORCING.

PEACHES AND NECTARINES.—*Earliest Forced Trees.*—Directly the last of the fruit is gathered cleanse the foliage of dust and insects by frequent washings with the syringe or garden engine, and if red spider or other insect pests are present an insecticide may be necessary to effect a clearance. The free exposure of the current year's growth to light and air by taking out the shoots that have borne fruit, as well as any others that are not likely to be wanted when the autumn tying-in takes place, is equally important. If this operation is judiciously performed, little pruning will be necessary in the autumn, and the young growths having had full exposure will be thoroughly ripe and well set with flower buds. The inside borders must have liberal supplies of water, and of a stimulating nature if the trees have been heavily cropped and show signs of exhaustion. If the wood is in a forward condition as to ripeness the roof

lights may be removed or remain on a little longer, but the question as to early forced trees is not so much in getting the wood ripe as in preventing premature ripening of the foliage. Before the lights are removed it will be advisable to mark well any trees requiring lifting, to check any exuberant growth, or for supplying fresh loam to any showing signs of failing vigour. The operation is best performed just before the fall of the leaf. Trees so treated seldom cast their buds or fail to set good crops of fruit, responding quickly on the application of genial heat when the house is closed, as might be expected from the presence of active surface feeders, the formation of which the lifting accelerates.

Succession Houses.—Trees ripening their fruit will be the better for a little ventilation night and day, and although moisture must be kept from the fruit a moderate amount of air moisture is necessary for the benefit of the foliage, available surfaces being damped occasionally, and the border must not on any account be allowed to become dry, but be kept moist. Artificial heat may now be dispensed with, except during a dull cold period, when a gentle heat in the pipes will contribute to a circulation of air and improve the quality of the fruit.

Trees after Stoning.—The exhausting process of stoning being completed, the trees should be thoroughly examined, and all pendant fruit that can be turned up to the sun brought round and supported, apex upwards, on pieces of lath placed across the wires forming the trellis. Keep the shoots carrying fruit stopped, and guard against overcropping. A fruit to every square foot of trellis covered by the trees is ample where size and quality is a chief consideration, and timely thinning to that number will not only increase the size of the fruit, but will often prevent its being cast in the process of stoning, or result in premature ripening. Syringe twice a day thoroughly until the fruit begins to ripen or soften, using clear soft water, as any other is likely to stain the fruit. Let there be no coddling, but leave a little air on all night, increasing it early in the morning, and rise to 80° after closing time in the afternoon.

Late Houses.—Keep the trees thin of wood, not allowing more to remain than will be necessary for furnishing next year's bearing wood, the extension of the trees, or that essential to attracting the sap to the present crop. Stopping will only be necessary with laterals and shoots above the fruit, unless it be advisable to stop any strong growth so as to divert the sap to other parts and secure an equal distribution of the growth. Let the borders be well supplied with moisture, and mulched so as to encourage surface roots. If the ripening is to be accelerated ensure it by early closing and husbanding the sun heat in the latter rather than the early part of the day, being careful to ventilate early.

STRAWBERRIES IN POTS.—It is now time that these were secured, and as nearly every cultivator has his own favourites we need only mention those that have done us good service. Foremost may be mentioned La Grosse Sucrée, Vicomtesse Hericart de Thury, and Sir Harry. Keen's Seedling is an admirable sort, but a bad traveller, and though Mr. Radcliffe is a good forcer and large, it is a bad colour—at least, for market purposes. Present is an excellent second early, and James Veitch with Sir Charles Napier to succeed, finishing with Dr. Hogg and Cockscumb. The runners should be laid at once, either in small pots filled with good loam and a sprinkling of short manure, or they may be layered direct in the fruiting pots. The latter must be well drained, and the soil consisting of good loam, with a sprinkling of bone meal and decayed manure rammed quite firm. The runners of two rows may be drawn into one alley, which will facilitate watering. The runners should be taken from fruitful plants only and from young plants, as these afford the earliest and most vigorous runners.

CHERRY HOUSE.—The crop being gathered, the next consideration is to secure the perfect development of the buds for the subsequent season, it being essential to this end to keep the foliage of the trees clean and free from insects. The trees should, therefore, be syringed similarly to what they were before the fruit began ripening; the ventilators should remain open constantly, but as the growth will now be complete, or nearly so, the best plan is to take the roof lights off. The border must not be allowed to become dry, but an examination can be made from time to time, and whenever the necessity for water arises a thorough supply should be given. If there are any trees in pots they should be moved outdoors directly the fruit is gathered, placing them on a bed of ashes in a sunny situation, protecting the roots by plunging the pots. In this position they must be well supplied with water at the roots and over the foliage, so as to keep it clean and healthy.

CASTING ACCOUNTS.

At last most bee-keepers are awakening to the fact that in apiculture, as in every other business undertaking, accounts of expenditure and income must be rigidly kept, or the balance can never be clearly shown to be on the right side, and therefore it is impossible for any individual to prove to a sceptical person that there is a reasonable margin of profit to be obtained from bees kept upon any principle not that of destroying the bees in order to take their honey. It is not at all an easy matter to keep accounts in a regular

methodical manner, and to some people it seems difficult to keep separate in their minds capital and current expenses and income. There is a very decided leaning amongst amateur bee-keepers to show a large profit at the expense of capital and without deducting the current expenses, thereby giving an appearance of financial soundness without any stability in reality.

There need be no expense attendant on keeping a just and true account of these three items. A moderate-sized sheet of paper is the only requisite, and a regular custom of putting down items on the day money is received or spent. It is the object of this article to bring before the public an easy system of showing their profits or their losses upon sound commercial principles—a system by which, if at the end of twenty years as a bee-keeper a man was to be sold up or to give up the culture, his stock in trade would realise rather more than what has been expended upon it, and not wiped off again either by setting aside of income or increase of stock by means of swarms or any other method of decreasing capital by the result obtained from the bees themselves. The plan advised is given below, and if followed will generally give entire satisfaction, as simplicity is its merit and brevity its endeavour.

Capital Account—Current Expenses—Income.—Under the first heading of Capital Account all primary expenditure of swarms, stocks, hives, smokers, or all other necessary utensils in or about an apiary must be set down. Under the second heading all syrup or other food used in spring or autumn either to stimulate or carry the hive through the winter season must be entered; all supers, sections, and other vessels for obtaining honey from the hive or for putting it in for sale when obtained, and all quilts and coverings: and under the third heading all money received for honey or bees sold must be set down. If rent is charged, or attendance, they must of course be entered under the head of Current Expenses. The difference, then, between the amount of income and current expenses will give the profit for the year. When, then, this profit is ascertained a valuation of stock must be obtained; and if the valuation account allowing 10 per cent. for depreciation shows any deterioration, then a further sum must be deducted from the profit to bring up the stock to its original value. If, on the other hand, the valuation shows an increase in value of stock, then either the difference between the original capital expenditure and the increased value can be deducted from the capital account, thus reducing this original outlay; or the increase may be left to give income in the future from no expenditure at all, and also so as to allow in a bad year a depreciation of stock so far as it does not reach below the primary capital expenditure without making a call on the current profits in order to bring up the stock to its super-ordinary value, this being in effect the creation of a reserve fund. But it is absolutely necessary for everyone to impress upon his mind that if he originally spends £10 in capital account, and in the current year has £2 current expenses and £6 income, his nett income will be, if his valuation shows his stock to be worth £10, still £4 only; while if his stock is only valued at £8, his profit will be reduced to £2 in order to bring his stock up again to its normal value.

Again. If the stock is valued at £15 there are, as I said before, two courses open—one to reduce the capital to £5, the other to leave the stock intact at its £15 value to return increased income without any corresponding outlay. But if this be the course adopted, the stock must next year and in the future be maintained at £15 in order to maintain its proper status; otherwise it would, if there is any chance of future depreciation, be better to sell £5 worth of bees and stocks, and so to make sure of the money, although it might not be so remunerative as if well managed in the form of bees. It need hardly be said that if it suits the fancy of the bee-keeper he would be quite justified in selling bees to the amount of the increased value in stock, and looking upon such value obtained as a part of the current year's profits.

Such, indeed, is the course pursued by many, but to me it seems wiser to build up an apiary gradually with only the outlay originally made in the purchase of the nucleus hives.

In future, then, let every apiarian, even if the possessor of but one stock, endeavour to keep a clear if concise account of his profit and loss, and if at the end of the year his profits are not so great as he formerly imagined them to be before he began to reckon the cost of different items, he will, without doubt, feel a greatly increased pleasure in being able to point to a well-balanced account. He shows with pride that he is able not only to attend and watch over his bees, these givers of such great pleasure, but also to keep a just and strict account of all their labour, and so be of use to the world in general, and himself specially, as one of the few but ever-increasing number who prefer to gather the nectar from the flowers by Nature's given agents rather than allow it to waste its lovely substance without material benefit to humanity.—FELIX.

TRADE CATALOGUE RECEIVED.

W. J. Birkenhead, Fern Nursery, Sale, Manchester.—*Hardy North American Ferns.*

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

To Our Readers.—In consequence of the publication of the index for binding with the numbers for January to June inclusive, and the pressure of other matter, several articles of considerable interest must stand over till a future issue.

Exhibiting (*H. G. M.*).—We always like to see the printed conditions of a schedule before giving an opinion on a disputed point. Our opinion of your case as it is presented is this—If the two individuals have "gone into business" for earning a "living" by purchasing and selling plants, we do not consider they are eligible to compete in either of the sections; but if they rely on other employment for a "living" and they only make a little money by selling plants in addition, and in that way occupy their spare time, we fail to see how you can exclude them. Of course the conditions can be altered by the committee, if desirable, for another year.

Musa Cavendishi (*G. S.*).—This is usually cultivated in England, because it is sufficiently dwarf for ordinary houses. It is also free-fruited, and when well ripened of good flavour. There are many varieties of Musa sapientum, which differ considerably in flavour, some being very fine, but they are mostly too tall for the houses in private gardens, and M. Cavendishi is much to be preferred.

Peaches Splitting (*Alva*).—It is somewhat singular that the fruits should be injured on the under side only. Are you sure they were not rubbed when young, such as in the process of setting? as the very slightest injury there would grow and show itself in the manner of the examples before us. We regret we can suggest no cure now. The fruit is not swelling kindly by any means. Is the border kept moist on the surface while it is dry below? See to this, and if there is the slightest evidence of dry soil 2 feet below the surface give a heavy watering, following with liquid manure. We should remove the most injured fruits and give the others a better chance to swell. Such as you have sent to us could never be of any use if left on the trees.

Eucharis Unhealthy (*A. E. T. T.*).—Your plants appear to be in a very unhealthy condition, and we should advise you to carefully read the article upon Eucharis culture in this Journal, April 9th of the present year, page 294, which was written by one who has been successful with this plant.

Bougainvillea (*Ten-years Subscriber*).—As nearly as we could judge from the small shoot sent we think your plant is Bougainvillea spectabilis, which is also much more shy in flowering than B. glabra. It appears to succeed best in good loam and peat without any manure, requiring a well-drained pot or border, as water must be liberally supplied during growth. Endeavour to have the wood well ripened, and keep the roots rather dry during winter, as a good rest seems necessary to ensure flowering. Firm, well matured, not too luxuriant a growth, and a distinct period of rest will probably enable you to flower the plant.

Hybrid Hibiscus (Cavan).—The flower sent appears quite distinct, and the plant is well worthy of preservation, especially if you find it retains its character.

Pruning Lilacs (Cambridge).—It is rather late for pruning if the bushes are to flower another year. Had you done so directly they ceased flowering, and the season proved good to thoroughly ripen their wood before autumn, they would undoubtedly flower the following season. The best time to prune Lilacs growing in borders outside is during the winter months, any time from the end of October to the following February, but the earlier it is done the better. These shrubs will bear very hard pruning, and for some seasons after will grow with increased vigour. If your bushes require to be cut back severely you had better leave them until winter, and a strong growth will be certain the following season, and in all probability a good crop of flowers the next spring if the branches are not too crowded and suckers are prevented extending from the roots. As to Chrysanthemums take off the summer bud, No. 3 in your diagram, and let the shoots 1, 2, and 4 extend. We will refer to the subject again.

Liquid Manure for Strawberries (M. F. B.).—There is no better liquid manure for Strawberries than the drainage from manure heaps or sewage, but when these are not obtainable guano water may be used, and has often been applied with great benefit. Half an ounce dissolved in a gallon of water is sufficient for plants in pots, but twice that quantity may be applied safely to established plants that need extra support in the open air. It should not be poured on the fruit or leaves, only on the soil, copiously, and if this can be mulched afterwards for the retention of the moisture it will be an advantage. It is an excellent plan to give liquid manure as soon as the fruit is set, then cover the ground with straw or other suitable material for keeping the fruit clean and preventing the evaporation of moisture from the earth. The use of liquid manure should be discontinued when the fruits commence colouring.

Ventilating a Vinery (F. J.).—No hard-and-fast rule can be laid down. On some days the front lights might be safely opened as you suggest, but with a dry driving wind blowing directly on the house we prefer not to open them to any material extent until the top ventilation fails to prevent the temperature rising too high. We are speaking now of Vines in full growth and with the crop swelling, as dry currents of air are then not conducive to free progress, but favourable to insects. The top lights should be left open to the extent of an inch or two all night, and should be opened wider the moment the sun raises the temperature in the morning, increasing the openings so long as the heat continues rising. With the top lights opened to the extent of a foot, the front sashes may be opened about an inch, more or less, according to the direction of the wind, increasing the top ventilation afterwards to its full extent if needed; then, if the temperature cannot be kept below 85°, the front lights must be opened more widely. We do not know that we can give more precise instructions, and the cultivator must exercise his judgment in the work in question. When the foliage gets firm and the wood commences ripening, more air may be admitted by the front lights than when the growths are young and tender. Your other letter has been handed to the publisher, the subject of it is beyond the province of the Editor.

Mildew on Grapes (C. O.).—We readily answer all the letters we receive, but by some cause or other that we cannot explain one now and then goes astray. It is by no means easy to tell you the "cause" of mildew on your Grapes beyond saying that the spores are in the house, and they find a suitable medium for germination. If you read the article on Chiswick, page 527 last week, you will find that some Vines in the centre of the great vinery there are attacked, while others right and left of them are free, the treatment of all being identical. The bunches there are dusted with sulphur tied in muslin, and a few days after are syringed with rain water. That destroys the mildew and does not disfigure the Grapes; but well water, or water containing lime, will leave unpleasant marks behind it. We should admit still more air, and employ a little more fire heat if needed for maintaining the requisite temperature. Keep the air of the house rather dry, and the roots of the Vines moist. In the winter the Vines and every part of the house should undergo a thorough cleansing, and painting if convenient, removing also the surface soil from the border if it is inside the house, adding fresh compost.

Red Spider on Vines—The Onion Maggot (N. H., Somerset).—There is no mistake about what is "wrong with the leaves;" they are swarming with red spider and the insects are abstracting the juices, hence the flimsy nature and yellow hue of the foliage. We should syringe them forcibly, directing the syringe between the bunches and driving the water directly to every leaf, not one should escape. A large four-gallon canful will not be too much for each Vine. If you cannot wash off the insects in this way—and we think you can—follow with a dusting of sulphur or an insecticide applied with a spray-diffuser, as little or none will then fall on the fruit—that is, if the work be carefully done. See our reply to "R. H. T.," on page 516. Do not employ any more fire heat than is necessary to prevent the temperature falling below 60°, keep the roots moist, and sprinkle strong guano water in the house when closing in the afternoon if the Grapes are stoned. The washing above referred to should be given when the sun is declining, leaving the ventilators open, so that the Vines get dry or nearly so before nightfall; or it may be done between five and six o'clock in the morning of a prospectively dry day, throwing the ventilators wide open and shaking the Vines to dislodge the water, and they will dry before the sun shines powerfully on them. When maggots get inside Onions they cannot be destroyed. You can try the effects of watering them with soapsuds, into each gallon of which a small wineglassful of petroleum is stirred briskly. This acts as a manure and should be applied in the evening. You ought to have tried the preventive remedy that was advised two or three weeks ago of covering the ground with lawn mowings.

Vine Leaves Withering (J. C.).—We are sorry your Vines are in such an unsatisfactory state. Of one thing we can assure you, and that is, we fail to perceive the slightest evidence of the phylloxera, and we think you have no cause to be alarmed on that score. We suspect you have indicated the source of the evil—wireworms in the border. As soon as you were aware of their presence it is a pity you did not plant it with Potatoes, and dig the sets up again when the plants were an inch or two high, and set more. We should plant Potatoes now if we had them,

and failing this should at once sow Carrots, but before doing so should give the border a good soaking with ammoniacal liquor from gas-works, if procurable, diluting it with five times its volume of water; if we could not get this we should try petroleum and soapsuds, as advised to another correspondent for his Onions. But we should first assure ourselves by an examination of the border that it is really infested with wireworms. We also think you have kept the house fully too warm, and we think it possible it has remained closed too long in the morning at some time or other. One of the leaves is certainly scorched—its condition being quite different from the others. We should lower the night temperature fully 5°, and employ as little fire heat as possible. Syringing the Vines with perfectly clear soot water could not possibly do harm, and might do good. It is made by securing soot in a bag and immersing in water for a day or two, then throwing in a few lumps of lime, and after removing the scum the liquor should be as clear as sherry wine, and of the same colour. It will be better to shade slightly than to allow the leaves to collapse. One reason for thinking the house has been kept too close is the length and slenderness of the footstalks of the leaves. We should, therefore, try a lower temperature, and give more air, especially very early in the morning, and should not close early with a high temperature and much moisture, and the same time a genial buoyant atmosphere must be maintained night and day.

Names of Fruits (W. J. J.).—The Grapes were mostly broken in transit, but we have little doubt the variety is Golden Champion. If it is disqualified under this name ask the judges to be good enough to state what it is.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should contain spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once. (H. M.).—*Lysimachia vulgaris*. (Cavan).—1, *Asclepias curassavica*; 2, *Thalictrum anemoneoides*. (Pat).—1, *Adiantum macrophyllum*; 2, *Betonica grandiflora*; 3, *Nephrodium effusum* var. *divergens*; 4, *Hakea saligna*; 5, *Nephrodium molle* variety. (Cuckfield).—*Bupthalmum salicifolium*. (Campus Martius).—*Myrica Gale*, the Sweet Gale, a native of Britain, (Old Subscriber).—The pink and white flower is a variety of *Gladiolus ramosus*; the other is the yellow Sweet Sultan, *Centaurea suaveolens*. (C. H. S.).—*Pyrus arbutifolia*. (A. B.).—The Trumpet Honeysuckle, *Lonicera sempervirens*.

Unsealed Cells—Supering (A. G. F.).—Bees not sealing their honey cells in supers shows there is a break in the supply of honey on the pastures, or the bees are not finding it plentifully, or they would seal their cells. If your hive that has swarmed is pretty full of bees, super at once, and it will prevent other swarms issuing, and if your locality is a good one for bees—i.e., if there is plenty of honey-producing flowers in the neighbourhood, you may get some good supers.

COVENT GARDEN MARKET.—JULY 1ST.

VERY heavy supplies reaching us, and prices are lower all round, more particularly Grapes and Strawberries. Vegetables plentiful.

DAIRY FARMING.

THE DAIRY.

THAT the home farm dairy should be cool, sweet, clean, well ventilated, replete with every convenience, and stand in an open airy situation, safe from all risk of any foul odours being blown to it from buildings or yards, would appear to be

so clearly necessary to ensure the production of really good butter, as to require no particular mention here. But so frequently have we seen rooms used as dairies that were unsuitable for the purpose that it is in the interest of our readers to point out how liable cream and butter are to sustain harm or be spoilt outright from exposure to the taint of impure air. Much has been done at dairy and agricultural shows to explain the entire process of making good butter, and to show that it is not a matter of chance, luck, or guess work. But in addition to the large working dairy, with its elaborate apparatus and steam power, we should much like to see a small model dairy for, say, a dozen cows, wherein we could find the best possible combination of economy, simplicity and utility. Great and wealthy societies are apt to take too high a flight, which occasionally carries them over the heads of the class they profess to benefit, and they may certainly be said to have done so in this matter. Our model dairy should contain two rooms—one for the pans of milk and the butter, and the other for the churning, butter-making, and cleaning of dairy utensils. The air of the dairy proper must be still and cool—neither hot or cold at any season of the year, the temperature never exceeding 55° nor falling below 50°. The windows should have ribbed plate glass, such as Hartley's rough plate, to keep strong light from the cream; the walls should be battened, and the roof thatched with heather, reeds, or straw. A simple furnace and flue is sufficient to keep the dairy at a safe temperature in winter, and it is to be regarded as indispensable, the temperature of the dairy and of the cream for churning being precisely two of the matters of detail that are commonly neglected, often at a cost of time and labour much to be deplored.

Straining the milk should receive careful attention. In very hot weather it should only be in the pans twenty-four hours, in warm weather thirty-six hours, and during cold weather forty-eight hours. The correct temperature for the cream when put into the churn is 57°, and it is brought to that temperature by putting the cream crock in hot or cold water. It is also a good plan to rinse out the churn with cold water at 57° just before using it. We have found it by no means an easy matter to induce dairywomen to use a thermometer. With many of them butter-making is still a mystery into which ordinary mortals must not seek to penetrate, and as to using a thermometer, why, anybody could do that; but they prefer trusting to their judgment, and a certain intuition which they assume to possess. We are obliged to own that the result is doubtful. Sometimes, or several times in succession, the butter is good, then comes a failure, the blame being invariably cast upon the cows. Nor can such blame be lightly set aside, for it must in fairness be acknowledged that the milk of a frightened cow, or which has been much worried by flies, will sometimes spoil that of other cows if mixed with it. Then, too, it must not be forgotten that a filthy cow-house will taint the milk. There must be thorough cleanliness from the milking to the using of the butter. A dirty udder and the milker's hands must both be washed before the milking. We use bright tin pails and glazed pans kept perfectly clean. The large barrel churn is used three times a week, and a small box churn for the daily table supply of butter. No salt is used in the daily churnings, but for the butter from the hand churn about 1 lb. of salt is added to 50 lbs. of butter, which is made into pounds and half-pounds. The churn is turned slowly at first, then faster, but with a steady regular motion which ceases at once when the butter comes, the average time of churning being about forty minutes. The butter-milk is run off, and fresh clear spring water is used to wash it three times, and it is afterwards washed twice in water in which the salt has been dissolved. Ice is very useful in very hot weather; when it cannot be had, and the butter is soft, it is left in the churn for an hour or two in cold water. A butter worker is decidedly better than beating butter by hand or with a towel. We use a grooved table and a ribbed roller, and finely grooved butter-slices, so that handling is altogether avoided.

Potting butter for winter begins when the cows are turned upon the pastures to eat the fresh young growth of the after-math following the hay crop. The milk is then at its best, the butter high-coloured and of a rich nutty flavour. Jars, glazed inside and out, are used, each jar being filled at once, and not gradually, the butter at top being covered with a thick layer of salt, the top being covered with a bladder and lid. Especial care and attention should be given to this work, for it is now, when good butter is so easily made, that carelessness creeps in, and we have twice had our store of potted butter for winter spoilt. We prefer jars which will contain 20 lbs. of butter, as that quantity is soon used, and if well made it is good to the bottom of the jar. If old jars are in use examine them narrowly, and see if the glaze is at all worn off; if so, discard them, for a porous jar is liable to absorb impurities, which would taint and spoil the butter.

WORK ON THE HOME FARM.

We have now haymaking in hand upon six farms, and have had to watch closely the manner of setting about and conducting the work by the bailiffs. It is our rule to state our wishes clearly to each bailiff, to afford him every facility for carrying them out, and to see that it is done. If a man betrays by his actions that he is puzzled a kindly word or two of explanation will soon set him right if he is fairly intelligent, and it is only when a case of egregious stupidity occurs that one has to interfere and take up matters with a firm hand. In so critical an undertaking as hay-making this must be done, for a day wasted may lead to a serious loss. Workmen soon know if the foreman or master understands his business, and they are very apt to act accordingly. As usual, there has been some trouble with machinery arising solely from crass ignorance and stupidity. A little patience and firmness, however, soon set things right. The hay crop is certainly a good one, and we have a remarkable example of the wisdom of careful culture and the use of good seed for permanent pasture in a twenty-acre meadow with the third year's crop. The bottom was thick with White and Red Clover, among which were Grasses of somewhat lowly growth; above them were the Fescues, Timothy, and Foxtail; while above all, fully 3 feet high, was a wonderful growth of Cocksfoot. It was still higher in some places, and we were amused at the sight of some men mowing round tree clumps almost hidden from view as they bent to their work. At first the tedding machine made rather poor work at this extremely heavy crop, but by crossing and bringing the horse rakes somewhat early into use we contrived to keep it all well turned and shaken. Frequent showers have much helped root crops. Both Swedes and White Turnips have come well, and the Mangolds are already making a brave show. We have White Mustard on several farms in all stages of growth, and have just had twenty acres more sown upon some heavy land, clean, but poor.

The Flock.—The lambs are weaned, and all of them have been sent from the home farm to two upland farms. We were somewhat puzzled to find scour very prevalent among the strong early lambs that were feeding upon a sound piece of Rye Grass and Trefoil. Upon inquiry we found they were having an extra quantity of linseed cake, which has a laxative tendency if used to excess among young animals, and we have had the quantity used much reduced. All the over-age and inferior ewes have been withdrawn from the flock, to be at once folded upon a strong piece of Clover; they will also have some dry food, and be brought on for the butcher by autumn—not all at once, but in batches as they become sufficiently fat.

REMARKS.

- 21st.—Fine and bright, but not hot.
 22nd.—Fine and pleasant morning; cloudy afternoon.
 23rd.—Cloudy day, with drizzle in morning.
 24th.—Fine, bright, and hot; evening cloudy, with spots of rain.
 25th.—Dull all day, but fresh and pleasant.
 26th.—Fine but cloudy; bright, cold, moonlight night.
 27th.—Fine and bright.

Although very warm on Wednesday, the following day was so cool as to quiet contract it, and the temperature for the whole week was rather below the average. There was very little rain.—G. J. SYMONS.

ROSES ANCIENT AND MODERN.

THIRTY-SEVEN years have elapsed since I inserted my first Rose bud, and I cannot remember a time when I felt more proud than when told by my great authority, the under gardener, a wonderfully clever youth in his way, aged seventeen, that my precious bud had "taken." I shall never forget that Rose, though I cannot tell its correct name. It had the darkest, richest, and most velvet-like blooms I have ever seen, and was known in those days as the Crimson Velvet. It opened too much—that was its fault, and often showed a golden centre, but there is not one Rose seen at exhibitions to equal it in the texture of its petals and its depth of colour, which is not surpassed by the darkest of single Dahlias. I fear this distinct old Rose is lost. If I had been half as sharp as Mr. Bennett I might have some "pedigree" Roses now darker than his; but it is no use grieving. A favourite dark Rose in those days, very double, but flat, was the Standard of Marengo, a famous grower and bloomer. Our best "tree" of it was worthy of the name, for the stem was 8 feet high, quite self-supporting, and the head certainly 12 feet in circumference—a fine object in its season, rising above the shrubs.

The finest light Rose of the period was *Souvenir de la Malmaison*, almost new then, and caused quite a sensation. It is still one of the most useful of Roses for garden decoration, as with a little judgment in pruning, and not a little liquid manure, it will flower three times a year. It is also occasionally seen in exhibition stands, but it is essentially a garden Rose, one of the first to flower in the summer, and one of the last to cease flowering in the autumn. It is one of the best Roses for massing in beds, and associated with the dark crimson Queen of the Bedders or *Général Jacqueminot* the effect is beautiful; it is also equal to any and superior to most for growing in gardens near towns, or where smoke is prevalent, and one of the best companions for it there is the charming old favourite the common Moss Rose, of which it is not easy to have too many when there is a large family of young swells and fair damsels always wanting something for bouquets and buttonholes.

The most generally admired rose-coloured variety in 1848 in our collection, and it was considered large in those days, was *Coupe d'Hébé*, and when caught in its prime it is questionable if there is a more pleasing Rose of its colour now. It was possibly the more valued because it enjoyed the reputation of being the Queen's favourite, but it really required no royal patronage to enforce its charms. A favourite white Rose in the garden was *Blanchefleur*, neat, compact, nearly pure, but delicate; it is perhaps "gone." Its rival was *Acidalie*, which remains one of the best of garden Roses still; and so also remain huge bushes of the Maiden's Blush, perhaps the hardiest of all, and will last longer and produce more blooms in poor soil than any other Rose I know.

We had also in those days several bushes of the York-and-

Lancaster, not the carnation-flaked Village Maid that has often passed for it, but the true old historic Rose, sometimes all red, sometimes half red half white, the petals striped and marbled. These, with many other good things that would now be cherished, were driven away by "improvements." I know where I could get armfuls of the Village Maid that is prized as the York-and-Lancaster, this latter, a much less free grower and bloomer, being, I suspect, scarce. I know where it is, but the stock is limited.

The yellow Rose most valued was the Double Persian, and there is not one to surpass it yet for coat-decoration, the half-expanded blooms being just of the right size, and the colour so soft and pleasing. Larger and brighter was *Harrisoni*, but less free, yet undeniably beautiful. We had also another yellow Rose, the brightest of all, and the brightest still, for I have never seen a *Maréchal Niel* to equal it in the Crocus-like yellow of its petals. It had no name, but was just called the "Old Yellow," and old the tree was, with its gnarled stem, wiry shoots, and small leaves, but such rich golden blooms that are not commonly seen now, because only a few persons own this rare old Rose. The old tree referred to has been dead long ago, and some young ones that I reared are also "gone." I have been since told that the correct name of this Rose is *Rosa sulphurea*, and if it is, all I can say is that if such a Rose were introduced or raised now, it would not be endowed with such a modest name, for the blooms are as bright as a Buttercup, but, the truth must be told, they did not always open freely.

The older a person grows the more he likes to dwell on the past. The young look to the future, and rightly; but memories of bygone days haunt the minds of all who have passed the meridian, like the refrain of a sweet melody that often rings so pleasantly in the ears of old and young alike. But even the young like to be taken to the days that passed before them, and to learn what "was doing" then; hence, in a chat about Roses at the beginning of my thirty-eighth Rose season, I have commenced at the commencement of the love that has never waned. There is something encouraging, fascinating, satisfying, in the culture of flowers, and the "appetite grows with what it feeds upon;" hence I am now enjoying, with all the ardency of youth, the floral feast of the modern beauties of to-day; but I cannot forget that the varieties now nearly obsolete, such as *Madame Laffay*, *Chenedole*, *Paul Ricaut*, *Paul Perras*, *William Jesse*, *Brennus*, and a host of others, were as much admired in their time as the most famed of the moderns are admired now.

Just when we were priding ourselves on our great collection of Roses, which comprised several hundreds of plants, or trees, a new clergyman came upon the scene—a gentleman every inch of him, rich, generous, good, and withal a bachelor, so that, as he said, he could do as he liked, and he liked to grow Roses. He was a man of no half measures; he either did a thing thoroughly or let it alone. His Rose beds were as good as the best soil and any quantity of it could make them, and the best Roses that could be supplied by the late Mr. Rivers, and subsequently Mr. Paul, were procured, and year after year the new ones were added. This clergyman dearly loved Roses, and felt it would be good for others to delight in them too. His gardens were open during the Rose season; his "people" were encouraged to collect Briars, were taught to "work" them, and supplied with buds for that purpose. In a few years gardens around this great Rose centre were full of Roses, and the hedgerows destitute of Briars. He is "gone," but the interest he excited in the Rose remains, for he left many disciples who cherish his memory and follow his practice of pruning and disbudding, and in rivalling each other in the production of fine blooms.

This Rose rivalry that begins at home, seldom ends there. Some local flower show tempts, and a venture is made with a dozen blooms, hoisted perhaps in bottles, or flopped down in boxes of moss. It is singular that nearly all beginners in showing Roses in stands or boxes stage their flowers too low.

There are exceptions, but it appears to be the rule that it is necessary to be beaten to arrange the flowers effectively—that is, distinctly clear of the moss or surface of the stands. Provided the foliage be good, and the blooms are level, they never show to such great advantage as when 3 or 4 inches above the moss; but uniformity of height is of greater moment than any prescribed length of stem; and uniformity in size is another point of no small importance, as one or two disproportionately large blooms make the others appear smaller than they really are.

In exhibiting in the best competitions, those who mean to win must be up with the lark in the morning. The very earnest ones are among their Roses waiting for daylight, and calculating on the prospective brightness or dullness of the coming day; they cut accordingly, and as far as possible at once arrange them in the stands. Many a prize has been lost by waiting until the dew has departed, and packing the flowers in baskets for after arrangement. There may be no visible bruises in the petals at the time, but they have an awkward way of "coming out" just about the time the judges are coming in; and when the competition is keen these gentlemen are very glad to see a fault to help them out of a difficulty in arriving at a decision.

Having had something to do with Roses in various ways, tending them by day and watching them at night; having blundered in cutting and staging, and profited by some mistakes; having lost and won, criticised and judged, I claim some sort of familiarity with the favourite flower of youth and of manhood, and have been led into these reflections by a pleasurable anticipation of what the most modern blooms will be like to-morrow (I am writing this on Friday, July 3rd), at the Crystal Palace Show.—A WORKER.

P.S.—I have been to the Palace, and was impressed with the magnitude of the Show. There may have been larger exhibitions of Roses, but I do not remember having seen one. There appeared to be a length of about 800 feet of boxes in competition, apart from the marvellous contribution of Messrs. William Paul & Son, which I suspect has never been equalled by any rosarian in any country.

The Rose of the Show was Mr. Bennett's new triumph, Mrs. John Laing, a deep rose-coloured flower, large, solid symmetrical, and very fragrant. It is something like François Michelin, something like Mons. Noman, and in form a little like La France, yet quite distinct from all of them, and a grand Rose. Her Majesty was once more enthroned, but the huge blooms open flat like Paul Neyron. They must evidently be cut young, and will then add weight to any stand. Lady Mary Fitzwilliam is a beautiful nearly white Rose, destined to become popular; and another large light variety, Merveille de Lyon, was splendidly represented in some of the stands. The best dark Rose in the Show was Marie Baumann, at least no other was so good in so many stands, while the broad-petalled varieties Etienne Levet and Ulrich Brunner were in splendid form; so also was the Countess of Rosebery.

The finest Tea Rose in the Show was, to my mind, Souvenir d'Elise Vardon, and particularly charming was Comtesse de Nadaillac. Madame Cusin attracted by the translucency of its richly coloured petals; but darker was Grace Darling, a new Rose to me, staged by Messrs. Paul & Son of Cheshunt. Maréchal Niel was small throughout. The brightest stand of Roses in the Show, and the brightest I have ever seen, was the first prize twenty-four of Mr. Gray. Such are my impressions of this great Show of some "modern" Roses.

I have also had the pleasure of inspecting the National, the most truly representative Rose Show I have yet seen. "Ancient" Roses were there in hundreds, and were interesting; "modern" in thousands, and magnificent. The gold medal to Mrs. John Laing was a fitting tribute of merit, and the plants exhibited showed the vigour of the variety. Merveille de Lyon was something to see and to be remembered. Was ever such a display of white Roses seen before?

As yet this is not an A. K. Williams year; hundreds

of brilliant blooms of it were staged at the two great shows, but only three of them good—in the Cheshunt stand at the Palace, and these were past good, they were grand. Mrs. George Paul was very fine indeed at the National, crimson, with a tinge of violet, quite a distinct colour. Alphonse Soupert, rosy crimson, with broad cupped petals, was well represented, and is a Rose of promise; but what can be said about Mr. B. R. Cant's new Tea, Madame de Watteville? It ought to be called the Butterfly Rose, as the waved or winged petals, white, shaded with rose, and deepening towards the edge, have a most chaste and remarkable appearance. It is a lovely Rose, deliciously scented. Countess of Rosebery was in splendid form in a few collections, and a bloom of Ulrich Brunner, the premier of the Show, was 15 inches in circumference. This was evidently a maiden bloom. There were more maiden flowers than at the Palace, and consequently large, but many from the cut-backs were smaller, as if the fixture fell just between the two seasons or sections.

The richest of the very dark Roses were La Rosière, Jean Liabaud, and Abel Carrière. Distinct in depth of colour was Dr. Hogg, of which someone had a good stand.

This is a long postscript. The difficulty is to know when to stop, so will stop at the Doctor, or he will stop me; but with his permission I may possibly turn up again another day.—A. W.

IN THE GARDEN.

LADYBIRD BEETLE (COCCINELLA).—Examining the other day the tips of the young shoots of some Gooseberries, I was delighted to watch the behaviour of this little gardener's friend voraciously eating the almost innumerable green fly which were snugly stowed beneath the curled leaves. I previously knew this insect, which is known in different parts of the country as ladybird, ladybug, ladyfly, and ladycow, fed, as well as its larva, upon aphides, but had never before seen it in the act of feeding. I trust this note will meet the eye of many young gardeners, so that they may know how much to respect this extremely pretty and useful little beetle. I well remember being so ignorant or mischievous as to destroy some of them, and there are doubtless many young in the craft who are likely to do the same unless made acquainted with its value in the garden in reducing the hosts of aphides.

Referring to green fly leads one on to notice their peculiar method of attacking the extremities of young shoots of the Gooseberry, for example. Some of my young bushes were badly attacked, and that speedily, but I exterminated them by pinching the ends of the shoots and consigning them bag and baggage into the fire. Of course I felt more inclined to do this, because the young shoots were grown quite long enough, and following the excellent advice ancient this business recently given in the Journal, I stopped them, and thus stopped the green fly. It is doubtful if every young gardener knows the remarkable power these insects have of changing their very nature in early summer, about this time—i.e., many of them cease depositing eggs and become viviparous, so that while in the earlier part of the season they lay eggs which in turn have to be hatched, and consequently they are not augmented so rapidly as when later on a whole community may become viviparous. The moral of this is, Destroy as many as possible early in the year, or you will have tenfold more work to do afterwards.

IRIS RETICULATA.—My bulbs of this gem are ripening off early. I have lifted some, and am highly pleased with their great size, for after growing a large number for many years I do not remember having lifted a finer batch. I was wishful to learn the result of last season's planting, as plenty of thoroughly decayed manure was placed directly beneath the rows of small bulbs, which were placed about 1½ inch apart, and covered with a mixture of coarse silver sand and ashes from burnt garden refuse in equal quantities. Evidently this treatment suited this pretty Iris, for the bulbs are turning out clean and very fine.

VEGETABLE FIRECRACKER.—Such is the name the Californians have given to *Brodiaea coccinea*, a very charming bulbous plant, which is now in blossom (June 29th). The slender stems are from 1½ to 2 feet high, terminated by numerous flowered umbels of tubular flowers; the tube is rich crimson scarlet, with the limb segments and small corona pale green—a very pretty contrast indeed, and waving gracefully it strikes you, as, in fact, it really is, one of the most distinct of all hardy

bulbs, for hardy it is if planted in the right position in rich vegetable soil. Thorough drainage is essential, and yet a cool moist position, and the bulbs should be placed a good depth beneath the surface so as to be quite clear of severe frosts, say 6 inches deep, and it dislikes being often disturbed, but may remain some years in the same position before it shows signs of deterioration.

TROPEOLUM POLYPHYLLUM.—This is one of the finest hardy plants possible to cultivation, with its long trailing shoots of pretty glaucous foliage, and very numerous axillary golden yellow flowers, it forms veritable wreaths of gold decorated with silver. In a light sandy well-drained soil it does wonders. I have repeatedly proved this in a small way, but when a few days ago I called at Messrs. Backhouse's nursery at York, and a large bed was shown me crowded to excess, I was more than convinced of the right position for it—revelling in the greatest luxuriance it, by this, doubtless forms a unique picture. It is certainly a plant which all gardeners should try to accommodate, as am sure it would satisfy most persons.

DOUBLE ROCKETS.—I have four varieties of these most useful and showy flowers—the French and Scotch whites, a purple and a pink, or rose; the last is very beautiful, double, forming immense spikes of flowers, but I believe comparatively scarce. Mine were picked up in the suburbs of Manchester, where it is greatly appreciated. The French white is very free-growing, but the spikes are rather lax and the colour faulty, being heavily tinged with purple; nevertheless it is a good garden flower. The Scotch is an excellent variety, forming dense spikes of pure white very full flowers, but it is not so free as the last, neither does it seem happy in many places south of the Tweed. As soon as flowering the stem must be cut down to induce young growth for cuttings. The purple and pink are both very good and showy, and a good plan to adopt after flowering is to peg the stems down to the soil, make a few cuts at the strongest joints on the side next the soil, and cover with a little sandy rich compost. Cuttings will be freely produced, which may be removed later on, often with nice roots, inserted in a cold frame, and a good stock of young plants will be produced.

ALPINE PINKS.—These are a very charming series by whatever name they are known. I am referring to *Dianthus alpinus* and its numerous variations. Certainly there is a great difference between what is considered as typical *D. alpinus* and what is usually distributed as *D. glacialis*. From a gardening point of view the latter is by far the best, but its life is short, and after flowering it frequently dies. Seedlings from *D. alpinus* vary greatly; in some the leaves are much narrower than in others, and the flowers vary in colour and height. There is no doubt these pinks are given to cross-breeding; that they will do so Mr. Lindsay of the Edinburgh Botanic Gardens has proved, for he crossed *D. alpinus* with *D. barbatus*, and I have now in my garden one of this hybrid flowering pretty freely, with the growth and individual flowers of *alpinus*, but the habit of *D. barbatus* is clear enough, as the flowers are borne in an umbel nearly a foot high, it is certainly a very pretty plant. Whether the alpine Pinks known in gardens as *D. alpinus*, *neglectus*, or *glacialis*, are finally recognised as only alpines I care not, but shall always endeavour to cultivate as great a variety of them as possible. That known as *glacialis* is by far the showiest, as I have before said, producing dense masses of its rich flowers in well-drained sunny fissures of the rockery, and with plenty of sand in the otherwise rich loamy soil.—T.

HORTICULTURAL ARGUMENTS.

MUCH information may be derived by your readers from the discussions that from time to time arise and flourish for a while in your Journal, but there is occasionally a spice of personality cropping up in some of the discussions that takes away considerably from the pleasure and profit of perusal. No one will assert, with any show of sound reason, that discussions cannot be prolonged without the indulgence in personalities which too often take place. Gardeners as a class are labouring for the advancement of horticulture quite irrespective of personal advantage, either as regards mere pecuniary reward, or, what is more evanescent, a slight advantage in a wordy war.

Motives other than the elucidation of questions affecting the progress and welfare of gardening should not prompt anyone to seize the pen and rush into print. That such is not always the case is to be regretted, and the hope may be expressed that with the increased circulation, and consequently increased power of the gardening press, there may come an even more friendly and entirely impersonal manner of conducting horticultural arguments. It will always be found that no harm can be done by treating others in a spirit of fair play and honourable rivalry, a rivalry not

prompted by personal feelings of jealousy or animosity, but born of the desire to bring to light some new theory, elaborate some apparently valuable idea, or record in the fullest and best manner the success or failure of some particular mode of practice.

Young writers are too often prompted to attempt smartness at the risk of becoming personal. Such should be strictly guarded against. Others there are, who are no novices with the pen, and yet are sometimes found indulging in what can only be described as personal attacks. All who wish that Horticulture should be maintained in all its aspects at as high a position as possible, will, I feel sure, re-echo the expression of the hope that soon personalities in horticultural discussions will be conspicuous by their absence.—SCOTUS.

THE AURICULA ELECTION.

As noted last week, the general remarks accompanying the voters' returns in many instances contain many interesting remarks, and they are given below.

The Rev. F. D. Horner writes:—"Since the last general election, which I tabulated in the 'Florist and Pomologist' (Dec. 1876, to Feb. 1877), very few new Auriculas have come into distribution, through many are yet in the hands of the various raisers. When the best new seedlings appear, the old flowers will be mostly surpassed. Of those that were 'old' in 1876 there remain two green-edged (Prince and Colonel), two greys (Lightbody and Hero). No white edges and no selfs are able to hold their own against the new flowers in their respective classes."

The Rev. H. H. D'Ombraïn says:—"There are some which have been omitted, and which are perhaps better than some named, but it is impossible to get them, and when obtained difficult to keep, such as Page's Champion and Booth's Freedom. Others, such as Conservative, although first-rate varieties, are too high-priced to recommend to beginners, for whom this list is intended to be a guide."

Mr. J. T. D. Llewelyn thus speaks of Heroine (Horner):—"Few Auriculas have pleased me more than the Rev. F. D. Horner's Heroine (self)."

Mr. Douglas writes:—"The above are the best that are to be obtained at present in the usual way through the trade. I have left out Freedom and Champion in green edges because of the great difficulty in growing them. Silvia is more a grey than a white, and has been placed in the grey-edged class. Sapphire I would put in the selfs, but am not aware that it has been let out."

The following is from Mr. Henwood (Reading):—"Among seedlings not yet obtainable are Horner's Monarch (green edge), far and away the best green yet shown. Horner's Heroine, a glorious flower far in advance of any other self. Brockbank's Wm. Brockbank, a superb grey that is bound to make its mark. Brockbank's Lord Rosebery, a grand self. Mellor's Reliance, one of the best white-edged varieties yet staged. Mellor's Mrs. Heap, a lovely blue self, rather small, but of splendid form. There are many other good seedlings that must ultimately displace some of the good old sorts. But still the good old sorts need not fear, for judging from present appearances we young exhibitors shall be grey-headed before some of the grand seedlings are in commerce."

Mr. Richard Gorton states:—"Were a number of the well-known new varieties allowed to be classed in the list a great change would result. Horner's Heroine is certainly at the top of the tree in selfs, and his Greyhound would also be in the first three in greys; Simonite's F. D. Horner would be high up, and his Heather Bell would be placed second or third also in the white edges."

Mr. C. M. Roysds (Rochdale) says:—"Seedlings in all classes of much quality are now being exhibited, and will supersede many of the old varieties, but our old friends must not be neglected."

Mr. Bolton favours with the following note:—"I have given the varieties only in commerce, but my opinion is that several of those named are surpassed by seedlings, notably in selfs by Heroine (Horner), which I consider the best self raised; and in the other classes Mr. Horner has seedlings that well deserve to be placed in the best six. Mr. Douglas, Mr. B. Simonite, Miss Woodhead, and S. Barlow, Esq., have also some very good seedlings, which, when in commerce, will hold a place in a good twelve, if ever they are so fortunate as to be distributed."

Mr. Ben Simonite makes no remarks anent seedlings, which are not sent out; but adds that the Rev. F. D. Horner and himself "have seedlings which would upset the list given." He preferred, however, that these should win their way, and stand on their own basis.

Mr. H. White (T. E. Hay, gardener) writes as follows:—"The improvement in Auriculas is steadily going forward, the Rev. F. D. Horner, Mr. Douglas, and Mr. Simonite being especially successful in raising new varieties. In green edges Simonite's Rev. F. D. Horner (not in commerce), I consider the best, and in grey edges, Greyhound, raised by Rev. F. D. Horner, is second only to George Lightbody, which I think is the most perfect Auricula we have. In white edges Rev. F. D. Horner's Luna, Magpie, and Miranda are the best I know of not in commerce, and in selfs Rev. F. D. Horner's Heroine is a long way in front of anything yet raised."

Mr. R. Dean confines his selection to what he has grown of flowers known to be in commerce. His simple aim was to give a selection of good standard useful varieties that can be obtained by anyone desirous of commencing to grow Auriculas.

Mr. C. Orchard thinks that the election will be a good thing for young beginners, as giving them a guide as to what to exhibit.

Mr. J. Garner writes:—"I want it understood that there are several sorts I have never seen, and I have made the list out with nothing but what have been grown and shown, and the majority are not only in commerce, but can be had for a trifle, whilst some other inferior sorts command a much higher price."

Mr. C. Phillips states:—"Horner's Monarch will take a conspicuous place amongst the greens. Douglas's Mabel, Horner's Greyhound, and Mellor's William Brockbank are splendid greys, but will not displace Geo. Lightbody. Horner's Heroine is unsurpassable."

ALPINE AURICULAS.

Only fifteen growers have sent in lists of twelve Alpines, many florists growing only the show kinds. The following return will show the views of the best southern growers, most of the varieties being of Mr. Turner's raising.

	Votes.		Votes.
Diadem	14	Sensation	6
King of the Belgians	12	John Ball	5
Mrs. Llewelyn	10	Geo. Lightbody	5
Mrs. Dodwell	10	Uniquo	5
Mrs. Ball	9	Mariner	5
Queen Victoria	8	Amelia Hardwidge	4
Philip Frost	7	Conspicua	4
John Leech	7	Col. Scott	4
S'ough Rival	7	Mrs. Phipps	3
Mrs. Meiklejohn	7		

The following had two votes each:—Elcho, Marchioness of Westminster, Beatrice, A. F. Barron, Duchess of Connaught, W. Fowle, Dazzle, Mercury, Goliath; and the following one vote each—Spangle, Distinction, Ada Hardwidge, Rosamund, S. Fellowes, Flora, Echo, Mrs. Thomson, President, Sailor Prince, Vesuvius, Silvia, John Jones, Fair Rosamond, Mauve Queen, Black Prince, F. Copeland, Phoenix, Susie Matthews, James Fowle. The following gentlemen kindly contributed to this list:—Rev. E. L. Fellowes; Messrs. J. T. D. Llewelyn, R. Gorton, W. Brockbank, J. Garner, C. Orchard, R. Dean, W. H. White, J. Douglas, T. Stirk, E. Wilson, H. N. Rolt, J. Ball (C. Turner), J. Cheetham, and J. Booth.

GUNNERSBURY HOUSE.

HAVING long been familiar with the productions of Mr. James Hudson at several of the leading exhibitions—admirably grown specimen plants, highly meritorious fruit, beautifully arranged groups of plants, with charmingly furnished dessert tables and floral decorations, for which Mrs. Hudson has won so many prizes, a note in the Journal last week on the Lord Napier Nectarine suggested that the garden itself in which so much good work is done might be worthy of a visit.

Gunnersbury House, Acton, is the residence of J. Atkinson, Esq., whose mansion is pleasantly situated in well wooded and charmingly diversified grounds ten acres in extent. They are separated by a lofty wall from the famous seat of the Rothschilds, Gunnersbury Park. A previous owner of Gunnersbury House displayed much ingenuity, and must have expended a considerable sum of money in rendering his side of the boundary wall ornamental. He had it faced with masonry to resemble an old ruin. Pillars, arches, embrasures, and mullioned windows were devised, and these now heavily mantled with Ivy have a romantic effect. In one part of the "ruins" are rooms for young gardeners, and over these, fruit rooms, store rooms, a Grape room, and other offices, so that the work, which is remarkable, is useful as well as picturesque. Parallel with the ruins, and a few yards from them, is a row of magnificent Elms, and a long embowered promenade is formed, which is delightfully cool in the summer.

From the natural terrace on which the mansion stands an extensive lawn recedes unmarred by a flower bed, and a miniature lake and several handsome trees and shrubs contribute to the attractiveness of the grounds. Such is the general character of the surroundings of Gunnersbury House, and a few of its special features may be briefly particularised.

THE FLOWER GARDEN.

This is small, but prettily arranged, and some beds of Begonias are full of promise, the plants being dwarf, stout, healthy, and just unfolding brilliant blooms. These have never been in pots. The tubers are started in boxes, then planted in rich free soil in cool frames preparatory to their removal with a wig-like mass of roots to the beds at the proper season. This is the right method, and with rich moist soil the plants grow luxuriantly. But Roses overshadowed everything else—not Hybrid Perpetuals, which were good, but a hower of old-fashioned climbing or rambling Roses. The trees are apparently half a century old, judging by their thick gnarled stems. It is known they were "trees" thirty-five years ago, and their great arms branch right and left, and the flowers are piled in dense masses overtopping the boundary wall like a bold undulating mass of fleecy clouds. The trusses appeared to be piled in heaps, and without doubt a cartload might have been cut from one tree of Alice Gray. Truly these floriferous old Roses are very delightful. In another portion we find a bed wholly occupied with Persian Yellow Roses, which are charming when expanding, Harrisoni larger and brighter, and the yellow and copper-coloured Austrians. The growths are pegged down and flower freely. We pass through a "strip" of kitchen garden, and

arrive at a rather extensive range of glass, two plant houses, a Peach and Nectarine house, and three vineries, but would first refer to a bed of

SELF-SOWN DAHLIAS.

As it is considered essential in raising Dahlias from seed for flowering the same year to sow in heat early, pot the seedlings and grow them under glass for a considerable time preparatory to planting out, a simpler method may be described, and so far as I know it is the first recorded example of exactly the same nature. Some single Dahlias grown in a bed last year ripened and shed their seed. Beyond taking up the roots and raking over the surface nothing was done to the ground in the winter. The scattered Dahlia seed germinated at the proper time, and now as fine a lot of plants are growing as could be wished, and that are certain to flower freely; in fact, buds are already perceptible in some of them. These naturally sown and undisturbed seedlings are sturdy and vigorous, very different to many that are drawn up under glass, and the trouble involved in the usual manner of raising them is often great, while by the natural method accidentally discovered it does not exceed that incurred in growing Radishes, and it is perfectly clear that single Dahlias can be raised without the aid of any glass shelter whatever.

LORD NAPIER NECTARINE.

The tree alluded to by Mr. Hudson on page 4 last week occupies the trellis in the house, which it practically fills; and there is not a gardener in Britain who would not be proud of such a tree. Mounting the step ladder at the back and taking a bird's eye view the sight was one to be remembered. Every fruit that could be raised was supported above the foliage on labels resting on the trellis and bridging the space between the wires. As usually seen this Nectarine is mottled, green being the prevailing colour, but on the tree in question the fruits are bronzy red or crimson, and it may be safely said that no better coloured examples of the variety have ever been seen; they are large too, some exceptionally so, and what is more, of excellent quality, full of vinous juice, melting and richly flavoured. Mr. Hudson is justified in regarding this as one of the most valuable Nectarines in cultivation, and he entertains a doubt if there is any other that would have developed into such a tree in the same time and produced a crop equal in all points—numbers, size, earliness, colour and quality; and if he were growing Nectarines for commercial purposes he would rely mainly on Lord Napier. At the same time he does not question the accuracy of the statements of persons who have found it less satisfactory in other and perhaps less dry and sunny districts, yet Mr. Bardney has it equally good in every respect, except perhaps in colour, and his exposed fruits are not very deficient in that respect. Mr. Atkinson's tree, it may be repeated, covers a space of 190 square feet, and this year's crop numbered 300 fruits. The tree was planted in 1878, and has been practically grown on the extension system.

GRAPES—FIRM VINE BORDERS.

Out of three houses, which at a rough guess may be 20 feet, 30 feet, and 40 feet long respectively, an uninterrupted supply of fruit is maintained all the year round as good as could be desired in size of berry, finish, and quality, "big" bunches not being coveted, indeed it is a little difficult to prevent their being too large. The early house from which the crop is being cut is occupied with Black Hamburgh, Foster's Seedling, and Madresfield Court, all of which are bearing medium-sized, full, regular bunches of very fine berries. In the Muscat house the crop is in every respect an excellent one, "lumpy" bunches with large berries of uniform size, and very fine are those of Alnwick Seedling and the bunches perfectly filled. The late house is regularly furnished with Lady Downe's and Alicante, but West's St. Peter's has failed to set well.

The wood of the Vines is not strong, but firm and short-jointed; nor are the leaves very large, but they possess great substance. The Vines are neither syringed in summer, nor peeled, daubed, or washed in winter, and not an insect troubles them. How is this? First, because the roots, actively working near the surface, are never dry; and, secondly, because the atmosphere of the houses after the Grapes are stored is heavily charged with ammonia. The borders outside are not dug and left for the sun to dry them and drive the roots downwards, but they are almost as firm as a garden path and covered with a layer of manure. That is the way to get a multiplicity of roots in the right place. The drainage of the borders is about as perfect as it can be, for the bottom is floored with rows of drain pipes placed side by side, from back to front, 2000 being used in the work. Pipe drains are also provided for ventilating one end, rising through the border, the other just under the hot-water pipes in the houses, where the air is warmed, hence rises, and a buoyant atmosphere maintained. When the borders were made care was taken that the soil was in the proper condition for compression, and it was made firm, as if in potting Vines, Strawberries, or Chrysanthemums. The object was to have Vines lastingly good, not for producing sensational growth and bunches at first, then a falling off, but good Grapes for years. It is to these firm borders that may be traced the character of the wood, not luxuriant but fruitful, the sub-laterals showing bunches freely.

SUB-LATERAL EXTENSION.

The management of the growths is not exactly orthodox. "Do not let the laterals run," say some authorities, "as undue root-action will be incited, and the berries of Madresfield Court will split or crack." Mr. Hudson knows very well what "causes the splitting of this grand Grape, which few growers finish in better condition than he does. With well-drained borders he has no fear of any amount of rain, and it is very clear he has no fear of active root-movement; he encourages it by not stopping

the sub-laterals of any of his Vines after the stoning period, while he does not top the leading growths at all, but lets them run down the back wall and ramble where they like. The fruit-bearing laterals are thinly disposed, and care is taken that the leaves between the main rods and bunches are exposed to full light; this insured, the secondary growths can go anywhere, and invite all the root-action they can for supplying sap to the berries for making them as large as possible. He is strongly opposed to checking the sap in any way, but likes it to flow freely and feed the fruit.

FEEDING THE LEAVES—PREVENTING GRAPES CRACKING.

Towards evening, when the owners of the Vines and their visitors do not usually pass through the houses afterwards, liquid manure is applied strong and freely to the floor, and all convenient surfaces, and the atmosphere is heavily charged with ammonia, but only, as has often been advised in the Journal, after the Grapes are stoned. The air is pungent and not altogether sweet, but the Vines enjoy it, and insects keep outside. Strong drainings from manure are preferred for this evening feast for the Vines, but guano is employed in its absence.

This evening damping and ammonia-charging is not practised where the Madresfield Court is ripening; on the contrary, that house was dry, and at seven o'clock in the evening the front ventilators were open to the extent of 3 or 4 inches. When the outside air is dry they are left open, when it is damp they are closed. In two or three years the berries split—a grievous disappointment. Damp air was at last found to be the insidious enemy, and the cause removed the evil ceased. There is no cracking of this Grape now, but the berries are as clear as the Hamburgs, as most persons know who have had to compete with them at shows. There has been a good deal of discussion on this matter lately, and it seems only right that Mr. Hudson's experience—not his words, but his work—should be thrown in with the rest, and it is commended to the notice of all who are interested in the subject.

WATER FOR VINES—AN OBJECT LESSON.

"Vines like water" has become an axiom with those who best understand them; hence they say, "Given good drainage they cannot easily have too much of it." There is a very good example of Vines liking water in the early house in the range under notice. A square tank is formed under the floor covered with a lid. A root from one of the two Black Hamburgs in the house found its way just over the top of the tank, or through a fissure near the top, and dipped down into the water. It has been said that a resisting medium is necessary for the multiplication of roots, and hence in firm soil far more fibres are produced than in a light medium. It is not easy, however, to conceive a more extraordinary increase of the roots of a Vine than has taken place in this tank. The one root has multiplied into thousands—a thick bundle or besom-like mass of fibres, without any greater "resisting" medium than the water, for it is clearly not necessary for them to come into contact with the sides of the tank or each other for the increase of fibres. After extending a few inches, what may be termed laterals start from them in beautiful regularity, and these in turn produce others, and this increase has been so remarkable that a good "lift" is needed to raise the mass out of the water. They are as brittle as glass, and as smooth as the roots of Hyacinths in water, but much smaller. No root hairs are visible with the aid of a magnifier, and Mr. Hudson has not been able to ascertain that any parts die corresponding with the fall of the leaf as is the case in the soil where the root hairs decay; but in the water, instead of an alternate decay and increase, there appears to be nothing but progression. They remain as fresh and, seemingly, as active in winter as in summer, but less quick in their extension during the resting period of the Vines. It must be understood that the water in the tank is not stagnant, but is constantly being used, and it is clear therefore that water is not injurious to Vines or Vine roots in winter when it is sweet—i.e., aerated.

The two Black Hamburg Vines in the house used to ripen their crops together, but the one with the roots in the water has gradually crept ahead of its rival, until now it starts distinctly sooner and the fruit is ripe quite ten days earlier. It was nearly all cut last week, but not a bunch had been taken from the other Vine. There is not a doubt that such a mass of roots with thousands of spongioles constantly imbibing moisture must have an effect in some way, but not many persons would have anticipated that this would be shown in the earlier ripening of the crop. The case is interesting, and gardeners who may call on Mr. Hudson should ask to see the Vine roots in the tank.

VEGETABLE CULTURE.

The same thought is given in this as in other departments, and the same good culture manifest. It can only be said, however, that Veitch's Extra Early Pea was the first gathered, leading William the First, and that if the ground in the distant kitchen garden were not trenched the supply of vegetables could not be maintained, as the crops would fail under dry weather. This is one of the many gardens in which deeply working the land is economical in saving after labour in watering; indeed, no expenditure in this work would produce anything like equally full crops in shallow soil. It is an instance of the old saying that the "spade beats the water pot entirely." In heavy soils on clay it is quite another matter. Mushrooms are plentiful and good. Beds are now just coming in, in what was once the Princess Amelia's wine cellar, which is close to the boundary wall of the Rothschilds, and belonged to the old mansion before the property was divided.

Mr. Hudson's charge is not an extensive one, but in every way agreeable. He ranks amongst the best of British gardeners. He secured the maximum number of marks in every section at the Chiswick examina-

tions, and seems to have won as many silver cups and medals as he cares for, and has hence practically relinquished exhibiting plants, nearly all the large specimens having been "done away with," a greater number of smaller being now grown for home-decoration; there is, however, a splendid example of *Asparagus plumosus nanus*, bluntly oval-shaped, perfectly furnished, and about 5 feet high. I intended calling at the "big place over the wall," but the absence of Mr. Roberts being ascertained the pleasure of a visit was deferred.—A CALLER.

ARNICA MONTANA.

THE genus *Arnica* is not an important one, nor does it contain many species of garden value; that, however, shown in fig. 4 is worthy of more

Fig. 4.—*Arnica montana*.

attention, as it is now comparatively neglected or confined to botanic gardens. On a rockery it has a pretty appearance, its bright orange yellow flowers being freely produced, and at Kew it has been attractive for some weeks past. Of the ordinary shades of yellow we have abundant floral representatives, but a pure orange is not so frequently seen, and contrasts with many other colours very effectively.

THE ADVENTURES OF COMTESSE DE NADAILLAC.

I THINK rosarians may be interested to hear a veracious account of the produce of a very small plant of Comtesse de Nadaillac Tea Rose, growing in the garden of a certain Rose-loving country parson.

Oddly enough, by-the-by, one of this same parson's boys, when about five years old, when asked as to his choice of a profession, made exactly the same answer as that recorded by Mr. Alexander in

the last number of the Journal. This plant of Nadaillac, which had never distinguished itself before, and was treated exactly the same as its companions, was on an old Briar about a foot high, and had one bit of wood only, old and withered-looking, about the size of a pencil. From this came, this year, two very short shoots only, and each had only one bud. When the first Countess showed petals, instead of coming fully out in the hot sun, as might be expected, and as so many on much longer and stronger shoots do, she took to swelling and growing, and by June 19th was fully out, and had petals nearly as long as the parson's finger. The first available Show was on the 23rd, and as it appeared hopeless she was cut and placed in a vase in the house. On the third morning she seemed dead, having either lost water or been placed too near a lamp, but completely revived again on being newly cut and receiving fresh water. She went to the Show after all with no attendant, and was "gone" before the day was out, but the best amateur Tea grower of last year failed to beat the stand in which she stood.

On June 26th the other Countess "came out," and she also had to stand four days before being shown, but was taken care of where she was. On June 30th she figured, against strong competition, in a winning box of twelve Teas, and was personally awarded the prize as the best Tea in the Show. On the next day she started again for another large show. Her stand of twelve Teas was again victorious, and this time she was awarded by the Judge, Mr. B. R. Cant, the silver medal as the best Rose (not Tea Rose only) exhibited by amateurs in the Show.

A trifle *passée*, she was refreshed sufficiently by a night's rest after two days in very hot tents to visit her third show, and make a very creditable appearance in another first-prize stand of twelve Teas. She exhibits some traces of dissipation after such a prolonged "season," but not a petal has fallen, and her "point" is still well preserved, as she passes her glorious old age in a place of honour in the parson's home.

I think it must be rare for the same bloom to be shown successfully three times, and twice to win premier honours against really strong competition. A bloom of Marie Van Houtte accompanied the Countess throughout, and was a conspicuous rival to her ladyship on the first day.—A. F. M.

MR. LAXTON has sent us examples of his new STRAWBERRIES King of the Earlies and The Captain. They arrived last week, but we were not able to acknowledge them sooner. Both these Strawberries have been fully described. King of the Earlies is medium sized, and rich in flavour; The Captain much larger, but not quite equal to the other in quality.

— DURING September of this year an extensive HORTICULTURAL EXHIBITION WILL BE HELD AT BERLIN from the 5th to the 15th of the month, and a large number of medals will be offered. The management of the Show is entrusted to Mr. Späth, 154, Kopnickerstr. Berlin.

— MR. ROBERT OWEN sends us a bloom of CHRYSANTHEMUM MDLLE. MELANIE FABRE, a beautiful incurved variety. The bloom was taken from a plant growing in a 48-pot. The plant had four blooms. The one sent is a lateral bloom, the centre or crown bloom being much larger. The plant never had any stimulants applied to it, or the flowers might have been much larger, the pot being full of roots. Judging from its appearance he thinks it will be a great acquisition, as the colour is quite new and distinct. The bloom we have received is certainly attractive, its colour very closely resembling that of La France Rose.

— FRUIT AT THE BATH SHOW.—Strawberries are generally very fine at the Bath Rose Show, but this season there was a marked exception to the rule, as they were shown fewer in number and much smaller than usual. Mr. H. S. Dutton had the best six dishes, distinct, these consisting of Marguerite, Newton Seedling, Sir J. Paxton, Duke of Edinburgh, Sir C. Napier, and President. Mr. G. Garraway was second. Mr. W. Tylee third. Mr. H. Scott had the best three dishes, and Mr. Tylee was second. With a single dish Mr. G. Garraway was first with Sir J. Paxton, Mr. Warden following with the same variety, and Mr. T. Evry third. A certificate of merit was awarded to Mr. W. Pratt, Longleat, Wilts, for a

seedling Melon named Longleat Perfection, this being a cross between Eastnor Castle and Hybrid Cashmere, and apparently possesses the good qualities of both.

— MR. J. H. CLARKE desires us to state that Mr. Featherstone of St. Ann's Nurseries, Leeds, contributed a group and a large collection of plants, not for competition, to the late Leeds Flower Show, which attracted much attention, besides having personally superintended the arrangement of the Show.

— THE taste for the original wild single Roses has developed remarkably since the introduction of the Rosa rugosa. The *Journal des Roses* says that one of the best is ROSA RUBRIFOLIA—red-leaved Rose. It is a native of Dauphiny, chiefly in the Vosges and the humid mountains of Auvergne.

— THE splendidly grown plants of CARNATION SOUVENIR DE MALMAISON at Kensington on Tuesday excited the admiration of all who saw them; and the exhibitor, Mr. Jennings, gardener to Leopold de Rothschild, Esq., Ascott, Leighton Buzzard, deserves the highest commendation for such excellent productions. It is doubtful if so large a number as 187 plants in 8 and 10-inch pots could be shown from any other private garden in the kingdom, and never have more vigorous and profusely flowered specimens been publicly exhibited. The plants had each from six to twelve blooms of great size and substance, while buds innumerable were expanding. The growth was very strong, and a slight stake to each plant was sufficient to support the heads of the flowers. It is to be hoped that the Royal Horticultural Society will accord Mr. Jennings a substantial recognition of this handsome exhibit.

— MEEHAN'S "Gardener's Monthly" has the following on HOW TO PRODUCE VARIATION:—"Just what induces a plant to become variegated is still a mystery. Mr. Rupp, the famous improver of the Chinese Primrose, tried in vain everything he could think of to produce variegation in the leaves. At length, noting a variegated plant of the common Clover in the fields, the thought struck him that possibly there might be some condition of the soil which induced it. He took the soil about this Clover plant, put some in a pot with a seedling Primrose, and got his long-desired variegation. 'One swallow does not make a summer.' Perhaps so, but it is worth looking out for more when we see one."

ROYAL BOTANIC SOCIETY'S EVENING FETE.

JULY 1ST.

ONE of the most beautiful events of the London season is the annual Fête in the Royal Botanic Society's picturesque Gardens, Regent's Park, and when the weather is favourable as it was on the 1st inst. very large numbers of visitors are invariably attracted. Seldom, however, does such a brilliant company assemble as on the occasion under notice, for the Gardens were thronged until nearly midnight, and continuous lines of carriages occupied all the roads for a considerable distance around the Gardens. Coloured lamps were freely employed, either lining out the flower beds or suspended from the branches of the trees, giving a fairy-like aspect to a most charming scene. A slight chilliness in the air rendered promenading more agreeable than sitting, and with this exception there was nothing to lessen the delights of a most successful gathering.

The exhibition of floral decorations occupied the large marquee which is devoted to the summer shows, and the Bagshot Rhododendrons filled another tent of great size, which was brilliantly lighted and very effective. The tables of flowers proved extremely interesting to the majority of visitors, and it was generally remarked that a most commendable improvement was observable in the taste exercised in the arrangement, and in the leading exhibits few could take exception to either the arrangement or the flowers employed. For a table decorated with flowers Mr. E. A. Chard, Clapham Common, won first honours for a very tastefully arranged table, on which were placed three trumpet stands containing a light and graceful association of double scarlet Potentillas, Chrysanthemum Etoile d'Or, Rhodanthes, and Grasses, the basal portion of the stands being chiefly filled with Eucharises, while around the table were placed small Cocos Weddelliana surrounded by Odontoglossums, double Primulas, and Carnations. The stands were wreathed with long trailing sprays of Lygodium scandens. Miss Hassall, Southfleet, Gravesend, and Miss H. Murray, The Red House, Wandsworth, secured the second and third prizes, in which perhaps rather too many flowers had been employed, and otherwise they were quite satisfactory. In the class for a table of hardy flowers some pretty arrangements were noticeable, but they were slightly heavy, and it is often seen that as regards public exhibitions stands of such flowers are rarely so graceful as the choicer flowers otherwise employed, and this is certainly not from any lack of suitable material, but apparently from a want of appreciation of their qualities. Miss F. Paget, Orchardleigh, Caterham, won chief honours with a pretty combination of Roses, Irises, Gladioli, Grasses, Sedges, and Ferns in three centre stands and four smaller corner glasses. Miss M. R. Hardy, Portland Place, was placed second, the chief features of her table being Oxeye Daisies, Grasses, Asparagus, and Ferns. Mr. J. R. Chard was third with a pleasing arrangement of Potentillas, Chrysanthemum frutescens, Sweet Sultan, and yellow Violas in three large central stands with saucers at the base and four others of smaller size. The tables of evergreens were all somewhat heavy, the first one from Miss Paget being particularly so, and, moreover, too elaborate

in design, consisting of a central arch upon which were placed the Grasses, chiefly Brizas, variegated Ivies and Hollies employed on the stands. Mrs. Edith Sperling and Mr. W. L. Buster, St. Mary Cray, were second and third, principally *Enonymuses*, *Berberises*, and variegated *Taxus* in the second, and miscellaneous variegated foliage in the third. The groups for a recess were not distinguished by any remarkable merit and do not require comment.

In the classes for wreaths, bouquets, and single stands the Judges evidently gave their favour to the most simple arrangements, which are becoming much more popular than the elaborate designs too often attempted by floral decorators. With flowers for personal adornment Mr. F. Perkins, Leamington, was placed first with wreaths chiefly of white and purple Pansies. The second prize was secured by Mrs. E. Clingo, 2, Swan Terrace, Belsize Park, for similar wreaths of purple Pansies and *Heliotropes*. With three stands for a dinner-table Mr. W. L. Buster won first honours with a simple arrangement of *Alstromerias* in the centre, with English Irises and foliage at the ends. Mr. Chard took the second place with three large stands and six smaller ones of *Chrysanthemum frutescens* and Grasses with pink Carnations. The competition was keen with bouquets, but there was a great diversity in the styles adopted, and in the merits of the respective exhibits. Messrs. Hooper & Co., Covent Garden, had the best bride's bouquet, composed of *Pbalanopsis*, white Roses, *Pancratiums*, and *Stephanotis*, with Fern fronds not too much crowded. Messrs. Henry & Co., 3, Victoria Buildings, staged the second-prize bouquet, which chiefly consisted of *Lilium longiflorum*, *Eucharises*, *Tuberoses*, and *Odontoglossum Alexandræ*, but the two first named were rather too large, and somewhat marred the otherwise good effect. Mr. W. Wood, 66, Conduit Street, was placed third with a combination of Roses, *Gardenias*, Orange blossom, and *Tuberoses*, but it was a trifle too heavy. Over a dozen competitors staged ball bouquets, and some had spent considerable time in producing painfully formal and enormous masses of flowers that few beyond the exhibitors could admire. A bold but simple yet magnificent bouquet of dark crimson Roses gained Mr. W. Wood the first prize, and attracted the admiration of the majority, though some objected to it on the score of heaviness. Mr. Prewett, Hammersmith, followed with a tasteful combination of light and dark *Heliotropes*, which under artificial light would have a rather dull appearance, but this quietness was pleasing, and its fragrance delicious. Messrs. Nieman & Cornish, Orchard Street, were third with a bouquet of Pansies and yellow Roses, which we did not admire. A class was also provided for an untied bouquet in water, and Mr. A. F. Youens, Leigham Court, Streatham, won chief honours with a most graceful and simple arrangement of *Pæonies*, *Lagurus ovatus*, other Grasses and Ferns. The great charm of this stand was the apparently careless, yet eminently artistic manner, in which the materials were associated, and Mr. Youens evidently possesses an accurate taste in such matters. Messrs. Nieman and Cornish followed with Pink Carnations, Asparagus, and Brizas lightly arranged.

Not the least important portion of the Exhibition was that comprising the groups not in competition, and especial praise must be given to Messrs. T. Rivers & Son's two extensive groups of fruit trees, comprising about sixty specimens of Cherries, Peaches, Nectarines, Plums, Pears, and Apples, and representing some of the choicest varieties from the Sawbridgeworth collections. Most of the trees were heavily fruited, and the silver medal awarded for the group was a suitable recognition of its merit. Messrs. Barr & Son, Covent Garden, also obtained a similar award for large collection of hardy flowers that formed beautiful groups in the marquee. J. T. Peacock, Esq., Sudbury House, Hammersmith, contributed a remarkably handsome group of Orchids, in which the superb *Odontoglossum vexillarium* predominated. This species is one of the features in the Sudbury House collection, and the condition of the plants shown prove how well they are grown. Many other *Odontoglossums* were included, and some richly coloured *Cattleyas* imparted much warmth to the groups. Miscellaneous ornamental articles were also shown in the corridor by several firms.

ROSE SHOWS.

NATIONAL ROSE SOCIETY.—JULY 7TH.

ALTHOUGH the weather had been disastrously dry for a considerable time before this important event in the rosarian season, yet an extensive and beautiful Exhibition was provided at Kensington on Tuesday last, the competition being extremely close in nearly all the classes. It was not the largest nor the best that the Society has held, but it deserves a position as a good average show as regards quality of blooms, and in numbers it was highly satisfactory. The Tea Roses were in grand condition and really took the foremost position in merit, for though there was an abundance of handsome Hybrid Perpetuals they were scattered through the stands, and there was a preponderance of smaller or rougher blooms that could not fail to be noticed on a most cursory glance round the tables. As at the Crystal Palace Show, the light and dark varieties were better proportioned than is usually the case, and this imparted much beauty to the display viewed generally, while in brightness or clearness of tint the blooms were admirable.

About 7000 blooms were staged in competition, and to these four rows of tables extending the whole length of the conservatory were appropriated. The centre table had two rows of stands, and for a portion of its length three rows, while on the other side tables were arranged single lines of boxes. The large central table had a grand appearance, which was due nearly as much to the line of Carnations separating the stands as to the Roses themselves. These Carnations, all of the variety *Souvenir de Malmaison*, were exhibited by Leopold de Rothschild, Esq., Ascott, Leighton Buzzard (gardener, Mr. Jennings), and never has so large a number of superbly grown plants been shown from one garden. The plants, of which 187 were exhibited, were in 8 to 10-inch pots, and bore from six to twelve expanded flowers of great size and substance, with numerous buds, the foliage and growth being extraordinarily vigorous. They constituted a grand feature in the Show and will long be remembered as a triumph of skilful culture.

Another triumph will render this Exhibition memorable, and that was the award of a gold medal to Mr. W. Bennett for his Rose Mrs. John Laing, which is the second honour of a similar character that has been obtained by this successful raiser. Her Majesty was the variety previously recognised, and those who saw the two together at Kensington on Tuesday did not hesitate to give the preference to the new comer. It was shown some time ago, but has not fully developed its characters until the present season, and now it has come in magnificent form; for probably over 100 blooms have been staged at three Exhibitions during the past week—namely, at Shepperton on Thursday, the Crystal Palace on Saturday, at both of which it was certificated, and at Kensington on Tuesday. It may be described as resembling *François Michelin* in build, with somewhat of the curl of petal in *Lady Mary Fitzwilliam*, but it is more globular than that Rose; and is, moreover, a Hybrid Perpetual, with the powerful fragrance of the old Cabbage Rose. The colour is a clear rosy pink, a delicate and pretty, but not strongly marked shade. If it maintain the characters it has displayed recently it will take a foremost place amongst exhibition Roses, as it possesses both substance and symmetry.

NURSERYMEN'S CLASSES.

In the larger classes devoted to nurserymen the blooms shown were not so fine as we have seen them at many previous Shows of the National Rose Society, and some extremely weak blooms were observable even in the winning stands. This was especially noticeable in the class for seventy-two single trusses, in which the Challenge Trophy, value sixty guineas, and £5 were offered as the first prize, for not one of the four collections staged were equal to some that have won the honours in preceding years. Yet considerable difficulty was experienced by the Judges in awarding the prizes, particularly as regards the first and second, and after they had accomplished their task much difference of opinion prevailed as to whether those selected for the first were really superior to the second. Mr. B. R. Cant, Colchester, was the fortunate winner of the Trophy, and no doubt he chiefly owed his success to the fine Tea blooms his stand contained, as many of the Hybrid Perpetuals were much weaker than those he had at the Crystal Palace on Saturday, and altogether we did not consider his collection up to his standard of preceding seasons. They were, however, bright, fresh, and clean, the light and dark varieties being well proportioned to produce a good effect. The varieties represented were as follows—*Gloire de Vitry*, Harrison Weir, *François Michelin*, *Souvenir de Mons. Boll*, *Innocente Pirola*, *Benoist Comte*, *Victor Verdier*, *Marie Baumann*, *Boieldieu*, *Madame Prosper Laugier*, *La Boule d'Or*, A. K. Williams, *Countess of Pembroke*, *Madame Crapelet*, *Mlle. Marie Cointet*, *Lady Mary Fitzwilliam*, *Ferdinand Chaffolte*, *Madame de Watteville*, very handsome; *Alfred Colomb*, *Niphetos*, *Reynolds Hole*, *Madame Charles Wood*, *Souvenir d'Elise Vardon*, *Etienne Levet*, *Jules Margottin*, *Comtesse de Serenye*, *Comtesse de Nadailac*, *Hippolyte Jamin*, *Horace Vernet*, *Emily Laxton*, *Merveille de Lyon*, *William Warden*, *Jules Chrétien*, *Star of Waltham*, excellent; *Ruhens*, *Duke of Wellington*, large and handsome; *Duchesse de Vallombrosa*, *Marchioness of Exeter*, *Queen of Queens*, *Madame Gabriel Luizet*, *Louis Van Houtte*, admirable; *Madame Eugène Verdier*, *Le Havre*, *Souvenir d'un Ami*, *Madame Annie Wood*, *Marie Baumann*, *Maréchal Niel*, *Duchess of Bedford*, *Baroness Rothschild*, *Général Jacqueminot*, *Madame Caroline Kuster*, *Marquise de Castellane*, *Ferdinand de Lesseps*, *Mons. Noman*, *Ulrich Brunner*, *Etoile de Lyon*, *Ville de Lyon*, *Marie Rady*, *Catherine Mermet*, *Fisher Holmes*, *Madame Montet*, *Xavier Oliho*, *Madame Welche*, *La France*, *Beauty of Waltham*, *Annie Laxton*, *Mrs. Baker*, *Madame Marie Verdier*, *Dr. Andry*, *Madame Ducher*, *Madame H. Jamin*, and *Madame Victor Verdier*. The second prize was adjudged to Messrs. Paul & Son, Cheshunt, for a collection which, like the first, contained many weak blooms, but it also included some of considerable merit, and the contest between the Colchester and Cheshunt champions was so close that Messrs. Paul had no reason to be ashamed of their defeat. The finest flowers were the following—*François Levet*, *Marquise de Castellane*, *Ulrich Brunner*, *Sultan of Zanzibar*, *Mrs. G. Paul*, *Comtesse de Serenye*, *Emily Laxton*, *Souvenir de Madame Alfred Vy*, *Prince Arthur*, *Madame Gabriel Luizet*, *Etoile de Lyon*, and *Edouard Andry*. The Cranston Nursery Company, Hereford, was third, and Mr. C. Turner, Slough, fourth, both having rather small blooms.

With forty-eight triplets Messrs. Paul & Son were the most successful of the six exhibitors, and in this class the general quality of the blooms was more satisfactory. The Cheshunt stand comprised good examples of the following varieties—*Marie Rady*, *Madame Gabriel Luizet*, *Madame Prosper Laugier*, *La France*, *Star of Waltham*, *Queen of Queens*, *Mrs. G. Paul*, *Madame Lacharme*, *Marie Baumann*, *Baroness Rothschild*, *A. K. Williams*, *Merveille de Lyon*, *Etienne Levet*, *Abel Grand*, *Dr. Andry*, *François Levet*, *Beauty of Waltham*, *Boieldieu*, *Duke of Teck*, *Caroline Kuster*, *Alfred Colomb*, *Marquise de Castellane*, *Horace Vernet*, *Pride of Waltham*, *Niphetos*, *Marguerite de St. Amand*, *Heinrich Schultheis*, *Ulrich Brunner*, *Comtesse de Serenye*, *Madame Eugène Verdier*, *Comtesse de Paris*, *François Michelin*, *Alha Rosea*, *Maréchal Vaillant*, *Devoniensis*, *Souvenir d'Elise Vardon*, *Louis Van Houtte*, *Jean Ducher*, *Countess of Rosebery*, *Devienne Lamy*, *Centifolia Rosea*, and *Duchesse de Vallombrosa*. Second honours were secured by Mr. C. Turner, whose blooms of *Etienne Levet*, *Duchesse de Vallombrosa*, *François Michelin*, *Xavier Oliho*, *Capitaine Christy*, *Baroness Rothschild*, *Beauty of Waltham*, *Lady Mary Fitzwilliam*, and *Duc de Montpensier* were worthy of mention. Messrs. Keynes, Williams,

and Co., Salisbury, and Mr. B. R. Cant followed in that order, each showing fairly good but not remarkable blooms.

The four collections of eighteen Teas, single trusses, formed an interesting and beautiful class, Mr. G. Prince of Oxford again maintaining his pre-eminence with these favourite Roses by charming blooms of the best varieties, distinguished throughout by their substance and excellent form. The varieties shown in the premier stand from Oxford were Niphetos, *Maréchal Niel*, *Innocente Pirola*, *Hon. Edith Gifford*, *Catherine Mermet*, very handsome; *Francisca Kruger*, *Souvenir d'un Ami*, *Anna Ollivier*, *Souvenir d'Elise Vardon*, *Madame Caroline Kuster*, *Souvenir de Paul Neyron*, *Madame H. Jamain*, *Rubens*, a grand bloom; *Mlle. Marie Arnaud*, *Princess of Wales*, *Jean Pernet*, *Bellefleur d'Anjou*, and a magnificent bloom of *Comtesse de Nadaillac*, of grand substance, for which a silver medal was awarded as the best Tea Rose in the nurserymen's classes. Mr. B. R. Cant, who was second, also had some substantial beautiful blooms, very prominent amongst which was *Madame de Watteville*, white or creamy tinted with rose round the margin of the petals, a lovely variety somewhat like a large but less highly coloured *Madame Cusin*. The latter variety was also splendidly shown together with *Catherine Mermet* and *Madame Bravy*, the others being slightly deficient in size. Mr. C. Turner followed, having *Souvenir d'un Ami*, *Triomphe de Milan*, and *Innocente Pirola*, very fine. Messrs. Paul and Son took the fourth place with smaller blooms.

Competition was keen in the four classes of division B, and eleven exhibitors entered with forty-eight single trusses, Messrs. Curtis, Sanford and Co., Torquay, winning first honours with a fresh, even, and bright collection of the best varieties. Mr. F. Cant, Colchester, had rather rougher blooms, but of good colour, and he well deserved the second prize awarded to him. Messrs. J. Burrell & Co., Cambridge, and Mr. John House, Peterborough, were third and fourth, each with less regular collections, and Mr. House's blooms were not nearly so good as some of those he had at the Crystal Palace. With twenty-four triplets Messrs. Curtis, Sanford & Co. were again the most successful of the nine exhibitors, being followed by Mr. J. House; Messrs. G. Cooling & Son, Bath; and Messrs. J. Jefferies and Son, Cirencester. A beautiful collection of twenty-four single trusses gained Messrs. Kinmont & Kidd, Canterbury, the premier honours, their blooms being greatly superior to those shown by the five other exhibitors. They were distinguished by their fine substance, and in this respect they were amongst the best of those staged by nurserymen. Especially noteworthy were A. K. Williams, Reynolds Hole, Charles Lefebvre, Dupuy Jamain, Beauty of Waltham, Horace Vernet, Marie Baumann, Madame Gabriel Luizet, and Xavier Olibo. The remaining prizes were secured by Mr. J. Mattock, Oxford, Mr. J. Walker, and Mr. G. Mount, St. Dunstan's, Canterbury, whose stand contained three uncommonly handsome blooms—namely, *Duke of Wellington*, *Lady Mary Fitzgerald*, and *Marie Baumann*, the latter most symmetrical and wonderfully bright in colour, its merits being recognised by the Judges in the award of a silver medal as the best Hybrid Perpetual in the nurserymen's classes.

Nine excellent collections of a dozen Teas and Noisettes were staged, and Mr. G. W. Piper, Uckfield, won the leading honours for very handsome blooms of *Souvenir d'un Ami*, *Souvenir d'Elise Vardon*, *Catherine Mermet*, *Devoniensis*, *Niphetos*, *Maréchal Niel*, *Innocente Pirola*, *Duc de Magenta*, *Madame Caroline Kuster*, *Adam*, *Souvenir de Paul Neyron*, and *Jules Mansais*. Messrs. G. Bunyard & Co., Maidstone, were second, their finest blooms being *Maréchal Niel*, *Catherine Mermet*, *Souvenir d'Elise Vardon*, and *Homère*. Mr. J. House and Messrs. J. Burrell & Co. were third and fourth respectively.

AMATEURS' CLASSES.

There was a good display in these classes, and the competition was close; but we cannot accord unqualified praise to the blooms staged, for amateurs have often shown much more strongly than on this occasion. As in the other classes, the dry weather had evidently produced an injurious effect, and when cutting their blooms the majority of exhibitors had selected young flowers that were frequently under the average size; and if they had been tempted by older and larger blooms they proved very disappointing when staged. Of course there were exceptions, and one of the most remarkable of these was the superb *Ulrich Brunner* in the Rev. J. H. Pemberton's stand, which was awarded the silver medal as the best Hybrid Perpetual in the amateurs' classes. This was of wonderful substance and size, over 5 inches in diameter, the petals massive, and the colour very bright.

Eleven competitors staged in the class for forty-eight distinct single trusses, for which the challenge trophy, value 60 guineas, and £5, were awarded to the Rev. J. H. Pemberton, Havering, Romford, for the following collection, reading the names as staged from left to right, beginning with the back row:—*Marquis de Gibot*, *Mlle. Eugénie Verdier*, *Madame Charles Wood*, *Magna Charta*, *Alfred Colomb*, *Baroness Rothschild*, *Countess of Rosebery*, *Ulrich Brunner*, *Madame Eugénie Verdier*, *Dr. Andry*, *La France*, finely built flower; *Edouard Morren*, *Merveille de Lyon*, *Marie Baumann*, *Pride of Waltham*, *Etienne Levet*, *Madame Lambard*, *Exposition de Brie*, *Anna Ollivier*, *Souvenir d'Elise Vardon*, *Countess of Oxford*, *Madame Jacquin*, *Madame Gabriel Luizet*, *Marie Rady*, *Madame Hippolyte Jamain*, *A. K. Williams*, *Miss Hassard*, *Star of Waltham*, *Madame Margottin*, *Madame Montet*, *Madame Prosper Laugier*, *Jules Finger*, *Devienné Lamy*, *Mons. Noman*, *Abel Carrière*, *William Warden*, *Marquise de Castellane*, *Louis Van Houtte*, *Henri Ledechaux*, *Horace Vernet*, *Devoniensis*, *François Michelon*, *Reine Marie Henriette*, *Pierre Notting*, *Marie Cointet*, *Madame Victor Verdier*, and a wrongly named variety. W. J. Grant, Esq., Hope End Farm, Ledbury, was a very good second, having fine blooms of *Constantin Tretiakoff*, *Marie Verdier*, *Duke of Teck*, *Rosieriste Jacobs*, *Marie Baumann*, *Souvenir d'Elise Vardon*, and *Alba Rosea*. T. W. Girdlestone, Esq., Sunningdale, Berks, was awarded the third position for a bright collection, amongst which several Teas were very prominent. The fourth place fell to the Rev. R. C. Hales, Woodmancote Rectory, Henfield, Sussex; this was a beautiful class in which 528 blooms were staged. In the class for twenty-four distinct varieties there were only two collections staged. The Rev. F. Page Roberts, The Rectory, Scole, Norfolk, and J. Gurney Fowles, Esq., Woodford, Essex, were first and second respectively.

Eleven entries were staged of twelve distinct varieties, three trusses of each. The Rev. J. H. Pemberton was well to the front with a noble collec-

tion, the blooms both bright and massive. Etienne Levet, La France, Madame Victor Verdier, Madame Gabriel Luizet, Ulrich Brunner, Pride of Waltham, Mons. Noman, Louis Van Houtte, Merveille de Lyon, A. K. Williams, Duchess de Vallombrosa, Exposition de Brie. T. W. Girdlestone, Esq., took second honours. Souvenir d'Elise Varden, Marie Baumann, and Merveille de Lyon grand examples. R. N. G. Baker, Esq., Heavitree, Devon, and Mr. S. P. Budd, 8, Jay Street, Bath, were awarded third and fourth prizes in the order of their names. In this, like the forty-eight class, the prizes were very keenly contested, all the exhibits being of good quality and colour.

The Rev. F. Page Roberts worthily deserved the premier award for eighteen Teas, so remarkably even were they that to attract the admiration of everyone. His varieties were *Innocente Pirola*, *Anna Ollivier*, *Madame Welche*, *Caroline Kuster*, *Madame Bravy*, *La Boule d'Or*, *Madame Hippolyte Jamain*, *Jean Ducher*, *Souvenir d'Elise Vardon*, *Comtesse de Nadaillac*, *Madame Margottin*, *Niphetos*, *Marie Guillot*, *Catherine Mermet*, *Marie Van Houtte*, *Souvenir de Paul Neyron*, and *Etoile de Lyon*. T. W. Girdlestone, Esq., was awarded second honours. Alfred Slaughter, Esq., Jarvis Villa, Steyning, third, and T. B. Hall, Esq., Larch Wood, Rock Ferry, fourth.

The chief class in division D was that for twenty-four single trusses, in which there were eight entries. H. J. Waterlow, Esq., Great Doods, Reigate (gardener, Mr. J. Brown), being awarded first honours for a pretty collection of well-selected varieties, comprising the following:—*La France*, *Duc de Rohan*, *Henri Ledechaux*, *Merveille de Lyon*, *La France*, *Mrs. Baker*, *Ferdinand de Lesseps*, *Heinrich Schultheis*, *Baroness de Rothschild*, *Anna Ollivier*, *Lady Mary Fitzwilliam*, *Etienne Levet*, *Duchess of Connaught*, *François Michelon*, very fine; *Madame Gabriel Luizet*, *Eugène Fürst*, *Star of Waltham*, *A. K. Williams*, *Duke of Connaught*, *Capitaine Christy*, *Pride of Reigate*, very fine; *Edouard Morren*, *Marie Rady*, *Mons. E. Y. Teas*, extremely good; and *Jules Finger*, similarly beautiful. Miss Watson Taylor, Manor House, Headington, and R. E. West, Esq., Reigate, were second and third respectively. Six stands of eight triplets were staged; Mr. Brown; Mr. W. L. Jackson, Stagden Vicarage Mr. W. H. Wakeley, Rainham; and the Rev. E. L. Fellowes, Wimpole Rectory, Royston, being the prizetakers, the first-named having a particularly handsome collection, in which *Marie Rady* and *Etienne Levet* at once attracted attention.

With eighteen single trusses Miss Baker, Holmfels, Reigate, won leading honours for a pleasing stand of the varieties *Etienne Levet*, *Charles Lefebvre*, *Madame Gabriel Luizet*, *Hippolyte Jamain*, *La France*, *Victor Verdier*, *Marquise de Castellane*, *François Michelon*, *Jules Finger*, *Violette Bouyer*, and *Dr. Hogg*. E. M. Bethune, Esq., Denne Park, Horsham, was second with even blooms. Miss Christy, Coombe Bank, Kingston (gardener, Mr. Moorman), was third with a bright and good collection, and the Rev. E. L. Fellowes was fourth. Four other exhibitors showed in this class. Strong competition prevailed in the class for twelve Teas or Noisettes, ten exhibitors entering, and all staged well. Mr. Brown took the lead with fine examples of *Jean Ducher* (for which the silver medal was awarded as the best Tea Rose in the amateur classes), *Madame Cusin*, *Madame Caroline Kuster*, *Anna Ollivier*, *Souvenir d'Elise Vardon*, *Barrillet Deschamps*, *Devoniensis*, *Souvenir d'un Ami*, *Catherine Mermet*, *Bouquet d'Or*, *Alba Rosea*, and *Comtesse de Nadaillac*. Miss Baker was a close second, her blooms of *Anna Ollivier*, *Souvenir d'Elise Vardon*, *Princess of Wales*, *Hon. Edith Gifford*, *Madame Willermoz*, and *Comtesse de Nadaillac* being remarkably beautiful. Good examples were also noticeable in the third and fourth-prize stands from the Rev. E. G. King and Mr. W. H. Wakeley.

Division E contained four classes, in all of which there was good competition, but we cannot give the details of each. The prizewinners were however, as follows:—Class 16.—Twelve distinct, single trusses.—First, E. B. Lindsell, Esq., Hitchin. Second, Rev. A. Foster-Melliar, Bury St. Edmunds. Third, Rev. W. Wilks, Croydon. Class 17.—Nine distinct, single trusses.—First, Mrs. Fuller, Bexley, Kent. Second, Rev. C. Eddy, Basingstoke. Third, Rev. J. G. Hodgson, Hythe. Fourth, Mr. J. Sladden, Worcester. Class 18.—Six distinct, single trusses.—First, Mr. A. Horne, Reigate. Second, Rev. F. S. Taylor, Evesham. Third, Mr. J. Bateman, Highgate Road. Fourth, Rev. F. R. Burnside, Gloucester. Class 19.—Six Teas or Noisettes, distinct, single trusses.—First, Rev. A. Foster-Melliar. Second, Mr. J. Sladden. Third, Rev. J. G. Hodgson. Fourth, E. B. Lindsell, Esq.

EXTRA CLASSES.

Baskets of Roses were contributed by five exhibitors, all very similar in style, the blooms being arranged with Fern fronds, rather closely packed, and not quite so lightly placed as might have been desired. The most effective, however, was that from Eckroyde Claxton, Esq., The Rosery, Allerton, Liverpool, some handsome blooms being employed, and the lower part of the basket was clothed with moss. Mrs. Cuthell, Capelcraft, and the Rev. Allan Cheales, Brockham Vicarage, being second and third. An additional class for twenty-four blooms, twelve Hybrid Perpetuals and the same number of Teas or Noisettes, was provided, in which the Veitch Memorial medal and prize were offered, and it was expected that these would have brought a stronger competition than was the case, as though there were nine entries the blooms were only of average merit. The Rev. W. H. Jackson secured the substantial honours named, with Hybrid Perpetuals *Marie Rady*, *Madame G. Luizet*, *Etienne Levet*, *Duchesse de Vallombrosa*, *Marie Finger*, *Duke of Edinburgh*, *Madame G. Luizet*, *Marie Baumann*, *Madame Lacharme*, *François Michelon*, *Charles Lefebvre*, *Eugène Verdier*, and *La France*. Teas, *Souvenir d'Elise Vardon*, *Alba Rosea*, *Madame Caroline Kuster*, *Catherine Mermet*, *Madame Marie Van Houtte*, *Souvenir d'un Ami*, *Innocente Pirola*, *Homère*, *Jean Ducher*, and *Madame Angèle Jacquin*. The Rev. H. Berners, Harkstead Rectory, Ipswich, was second, and Mr. J. Grant third, each showing small but neat blooms. Far the best of seven collections of six varieties were from Mr. H. Foster, Ashford, Kent, who had excellent examples of *Abel Carrière*, *A. K. Williams*, *Madame Hippolyte*, *Marie Rady*, *Avocat Duviervier*, and *Alba Rosea*. H. E. Ponsford, Esq., Elm Lodge, Reigate; P. Waterer, Esq., Sutton, Surrey; and the Rev. F. H. Gall, Hitchin, followed in that order.

For the best six trusses of any Hybrid Perpetual Rose there were eighteen entries, and the prizes were awarded in the following order:—First, Mr. S. B. Budd, Bath, with *Ulrich Brunner* very handsome; second, G. Christy, Esq., Buckhurst Lodge, Westerham, with *Mons. Noman*, almost equally good; third, Mr. Grant, with *Constantin Tretiakoff*; and fourth, Mr.

Gray, Sevenoaks, with Etienne Levet. Nine boxes of six blooms, any Tea or Noisette, were also staged, the Rev. J. H. Pemberton leading with Anna Olivier, beautiful, followed by Mr. C. S. Cuthell with Maréchal Niel, Miss W. Taylor with Catherine Mermet, and Mr. Bethune with Innocente Pirola, all good.

OPEN CLASSES.

Twelve classes were enumerated under this head, the majority being devoted to stands of one variety, but a few were for general collections as in the first for twelve Teas triplets, in which there were eleven competitors. Mr. G. Prince again won leading honours with superb blooms of the varieties Comtesse de Nadaillac, Souvenir d'Elise Vardon, Hon. Edith Gifford, Prince of Wales, Maréchal Niel, Innocente Pirola, Catherine Mermet, Jean Ducher, Alba Rosea, Perle des Jardins, Francisca Kruger, and Rubens. Mr. B. R. Cant followed with a good stand, Madame Cusin being in splendid condition. Messrs. Paul & Son were third and Mr. F. Cant fourth.

An extremely interesting class was that devoted to "Garden Roses," as distinguished from the ordinary exhibition varieties, and in which a number of old favourites were shown. Of the five competitors Mr. Julius Sladden secured the chief prize with pretty examples of the undermentioned varieties:—Rosa multiflora, Ma Capucine (Tea), Jules Margottin (H.P.), Princess Clementina (Provence), Bougère (Tea), Madame Fillion (H.P.), Celine Forestier (Noisette), Amabilis (Tea), Olga Marix (H.P.), La Ville de Bruxelles (Damask), Fabvier (China), Homère (Tea), Miss Hassard (H.P.), Narcisse (Noisette), Madame Plantier (Hybrid China), and Fillemberg (Noisette). Mr. J. Walker's second-prize stand also contained some interesting varieties, Messrs. Bunyard & Co. and Mr. W. Rumsey being the other prizetakers with similar collections. The Moss and Provence Roses from Messrs. Paul & Son, Cranston, G. Prince and Bunyard were all very pretty, the best in the first stand being Baron de Wassenaar, Perpetual White, Little Gem, Common Moss, and Lanei.

Buttonhole Roses had a class devoted to them, and the seven collections entered contained some charming little buds. Mr. J. Mattock won the first place with exquisite examples of Anna Olivier, Madame Lambert, Innocente Pirola, W. A. Richardson, David Pradel, Madame Falcot, Marie Van Houtte, Souvenir de Paul Neyron, Catherine Mermet, Homère, Ma Capucine, and Rubens. Messrs. Cranston, who were second, had neat buds of Charles Darwin, Fisher Holmes, and Bouquet d'Or in addition to many of the preceding. Messrs. Bunyard & Co. followed, Homère and Madame Cusin being two of their best.

New Roses were only shown by two exhibitors, and the blooms were not of remarkable merit in any of the stands. Messrs. Curtis, Sanford & Co. were first with Marquise de Romain, Admiral Seymour, Mrs. G. Dickson, Mlle. L'Anier, Madame Raimbaud, Lord Bacon, Directeur Alphonse, Madame Dellevaux, Mlle. Julie Gautain, Mary Bennett, Baron de Rothschild, and Souvenir de Leon Gambetta. Messrs. Paul & Son were second with Pride of Reigate, Madame Alice Van Geert, Queen of Queens, Maréchal P. Wilder, Benoist Comte, Grace Darling, Madame Norman Neruda, Longfellow, Madame de Watteville, Eclair, Sunset, and M. Francisque Rêve. For twelve blooms of any new Rose not in commerce in England previous to 1883, Mr. B. R. Cant was first with Madame de Watteville, a lovely rose-tinted Tea variety previously noted. Messrs. Curtis, Sanford & Co. were second with Alphonse Souperet, and Messrs. Cranston third with Merveille de Lyon.

The special variety classes formed a beautiful display, and included some extremely fine blooms. For twelve of any yellow Rose Mr. G. Prince was first with Comtesse de Nadaillac, remarkably good. Messrs. Cranston were second with the same variety, and Mr. C. Turner third with Madame Margottin. In the White variety class there were nine stands of Merveille de Lyon, all very handsome, forming, indeed, one of the features of the Show. The prizes were won by Messrs. Curtis, F. Cant, and G. Paul. Fifteen stands of crimson Roses were entered, Messrs. Cooling taking the lead with A. K. Williams, followed by Paul & Son with Alfred Colomb, and G. Prince with Ulrich Brunner, all handsome blooms. Dark velvety crimson Roses were not largely shown. Messrs. Curtis were first with Jean Lelievre, and Paul & Son second with Abel Carrière.

With twelve blooms of any Rose Mr. H. Bennett, Shepperton, scored a success, for amongst fifteen competitors he was placed first with Her Majesty, of wonderful substance and very handsome, being followed by Messrs. Curtis, Sanford, & Co., with Ulrich Brunner, Mr. B. R. Cant with Souvenir d'Elise, and Mr. F. Cant with Mons. Noman, all remarkably beautiful examples of their respective varieties. Mr. Bennett's other success in the seedling class is referred to in the introduction to this report.

Miscellaneous exhibits, beyond the Carnations already mentioned and the magnificent collection of Roses from Messrs. J. Veitch & Sons, were not numerous, but the display of hardy flowers was beautiful and extensive.

The weather was very hot, necessitating the free ventilation of the conservatory, and during the day the blooms suffered considerably, some even of the medal blooms losing all their charms in a few hours. There was a large number of visitors, much satisfaction was expressed with what was collectively a handsome exhibition.

CRYSTAL PALACE.

MANY grand exhibitions of Roses have been held at the Sydenham Palace, and rosarians now regard it as one of the chief events of the year, but it is doubtful if so extensive a show as that of Saturday last has ever been provided there before. It was a great success, and though evenness of quality has been more notable on some previous occasions, yet there were abundance of blooms that could scarcely be surpassed either in substance, form, or colour. This was observable in nearly every stand, and the irregularity was attributed in most cases to the extremely dry weather that has prevailed for some time past. It seemed as though exhibitors had a difficulty in completing their stands, a proportion of very fine Roses were staged, and then the requisite number had to be made up of smaller and less satisfactory blooms. In the larger classes this was particularly notable, and especially so in the open class for seventy-two, which was one of the weakest as regards quality of blooms in the whole Exhibition. Some of the finest blooms were in the open classes for forty-eight triplets and twenty-four singles, and the competition in the latter was extraordinary, no less than

seventeen boxes of blooms being staged, and occasioned the Judges no slight difficulty. In the Tea classes there was a greater regularity of blooms than amongst the H.P.'s, and indeed they were extremely good in the majority of instances, as fresh and substantial as could be desired. In the H.P.'s there was a good proportion of light and dark colours, which was very noticeable when viewing the long lines of blooms from each end of the tables, and this added much to the beauty of the Show, for while the dark shades were very rich and bright, the light tints were clear and pure as they should be.

In all the leading classes the competition was very keen, and the bloom from the several exhibitors were so nearly equal in merit that the Judges had to give very careful consideration to them before they could determine their relative positions. A total of about 6000 blooms were entered in the classes, and together with about the same number from Messrs. William Paul & Son of Waltham Cross constituted an exhibition of unusual magnitude. The competing blooms were arranged in four lines on two series of tables reaching from the fountain to the centre transept, the central space between the lines of boxes being occupied with Palms, Ferns, &c., which served to break the monotony and formality that exhibitions of this character inevitably possess. All the arrangements were most satisfactorily conducted by Mr. W. G. Head, who deserves much praise for the highly successful show he was the means of providing.

OPEN CLASSES.—The most important of these is usually that for seventy-two single trusses, as the great Rose-growing firms put forth their utmost strength to insure success in what is often termed the champion class. This was not the case on Saturday, however, for even the renowned Mr. B. R. Cant of Colchester, who won premier honours, was not in his best form, and though his blooms were much superior to the others in the same class he has frequently exhibited finer and more even examples. He had blooms of the following varieties:—Ulrich Brunner, Innocente Pirola, Lord Macaulay, Magna Charta, Madame Prosper Laugier, Madame Bravy, Alfred Colomb, Niphotos, Boieldieu, Alphonse Souperet, Prince Arthur, La Boule d'Or, Duke of Wellington, Annie Laxton, Fisher Holmes, Marguerite de St. Amand, A. K. Williams, Victor Verdier, M. Isaac Perrière, Madame Noman, Jean Souperet, Duchesse de Morny, Général Jacqueminot, Madame H. Jamain, Dr. Seville, Comtesse de Nadaillac, Countess of Rosebery, Marquise de Castellane, Star of Waltham, Souvenir d'un Ami, Mons. Alfred Dumesnil, Hon. Miss E. Gifford, Earl Pembroke, Emily Laxton, Xavier Olibo, Madame Nachury, Mrs. Baker, Madame Caroline Kuster, Eugène Fürst, Baroness Rothschild, Horace Vernet, Madame Lacharme, Jules Margottin, Devoniensis, Marie Rady, Lady Mary Fitzwilliam, Madame Marie Verdier, Mademoiselle Julie Dymonier, Duke of Edinburgh, Maréchal Niel, François Michelin, Madame Gabriel Luizet, Comtesse de Serenye, Ferdinand de Lesseps, Souvenir d'Elise Vardon, Dr. Andry, Duchesse de Vallombrosa, Marie Baumann, Marie Van Houtte, Etienne Levet, Catherine Mermet, Abel Carrière, Mons. Noman, Dupuy Jamain, Marchioness of Exeter, Madame Ducher, Violette Bouyer, Le Havre, Merveille de Lyon, Sultan of Zanzibar, and Mademoiselle Marie Cointet. Messrs. G. Paul & Son, Cheshunt, were second, their blooms being rather less even and substantial, but there were some beautiful examples of Caroline Kuster, Sénateur Vaisse, Beauty of Waltham, Ulrich Brunner, Lady Mary Fitzwilliam, Etienne Levet, and Madame Eugène Verdier. Mr. Turner, Slough, was third with somewhat rougher blooms.

Four good collections were staged in the class for forty-eight triplets, and in this Messrs. Paul & Son won the chief position with rather full but handsome blooms, especially rich in colour. The varieties were Merveille de Lyon, Prince Arthur, Abel Carrière, Mons. Noman, Marguerite de St. Amand, Alfred Colomb, Marie Baumann, Countess of Oxford, Madame Gabriel Luizet, very fine; Louis Van Houtte, Dr. Andry, Madame Lacharme, Capitaine Christy, Marie Rady, Etienne Levet, Marie Cointet, Pride of Waltham, Antoine Ducher, Horace Vernet, excellent; Niphotos, Duchesse de Vallombrosa, Camille de Bernardin, A. K. Williams, extremely fine; François Levet, Centifolia Rosea, Mrs. G. Paul, beautiful in size and colour; Comte Raimbaud, Baron Rothschild, Madame Hippolyte Jamain, Xavier Olibo, Ulrich Brunner, very fine; Clothilde Rolland, François Michelin, Mons. E. Y. Teas, Beauty of Waltham, Violette Bouyer, Madame Eugène Verdier, Mons. A. Dumesnil, General Jacqueminot, Marquise de Castellane, Star of Waltham, Queen of Queens, Abel Grand, Victor Verdier, Duke of Edinburgh, Comte de Paris, Marie Verdier, and Duke of Teck. The second place was taken by Mr. B. R. Cant, who was not many points behind the first. Especially good were Comtesse de Nadaillac, La France, Madame Gabriel Luizet, Dupuy Jamain, Edouard Morren, François Michelin, Etienne Levet, and Ulrich Brunner, of wonderful substance. This Rose was indeed remarkably well represented throughout the Exhibition. Mr. C. Turner was third with smaller blooms.

The competition was keen in the class for twenty-four triplets, eight stands being entered, and they were all very close in merit, some of the best Roses shown being in this class. Mr. John House of Peterborough secured the premier prize with substantial and bright blooms of the following:—Baroness Rothschild, Beauty of Waltham, Duke of Teck, Madame Marie Verdier, François Michelin, Mons. E. Y. Teas, Dr. Andry, Violette Bouyer, Capitaine Christy, Louis Van Houtte, Fisher Holmes, Madame Gabriel Luizet, Madame Lacharme, Exposition de Brie, Marquise de Castellane, Marguerite de St. Amand, Magna Charta, Camille Bernardin, Horace Vernet, Duchesse de Vallombrosa, La France, A. K. Williams, Marie Baumann, Merveille de Lyon. Mr. W. Rumsey, Waltham Cross, and Mr. F. Cant, Colchester, followed in that order, an extra prize being awarded to Messrs. G. Cooling & Son, Bath.

Of the seventeen exhibitors with twenty-four single trusses Mr. John House was again the most successful, gaining the first place with very beautiful blooms, forming one of the most even stands in the Show. The varieties were A. K. Williams, La France, Ulrich Brunner, Souvenir d'Elise Vardon, Horace Vernet, Violette Bouyer, Lord Macaulay, François Michelin, Exposition de Brie, Marchioness of Exeter, Duchesse de Vallombrosa, Niphotos, Alfred Colomb, Madame H. Jamain, Louis Van Houtte, Maréchal Niel, Camille Bernardin, Madame Marie Verdier, Charles Lefebvre, Marquise de St. Amand, Beauty of Waltham, and Comtesse de Nadaillac. The second prize stand from Mr. F. Cant was a very good one and contained some excellent blooms, Madame Gabriel Luizet, Mons. Alfred Dumesnil, Etienne Levet, and Merveille de Lyon being uncommonly fine. Mr. G. Prince, Oxford, was third with bright but rather irregular blooms.

The open class for Tea and Noisette Roses was for eighteen varieties,

three trusses of each, and of the seven competitors Mr. G. Prince was easily first with such a collection as we are accustomed to see from him, the blooms all fresh, beautiful, and even. The varieties were Comtesse de Nadaillac, Madame H. Jamain, Hon. Edith Gifford, Marie Van Houtte, Perle des Jardins, Rubens, Princess of Wales, Souvenir d'Elise Vardon, Jean Vernet, Souvenir d'un Ami, Jean Ducher, Niphotos, Innocente Pirola, Anna Ollivier, Maréchal Niel, Francisca Kruger, Catherine Mermet, and Alba Rosea. Mr. B. R. Cant was second, also with handsome blooms, the following being remarkably fine:—Madame Cusin (charming), Catherine Mermet, Madame Caroline Kuster, Souvenir d'Elise Vardon, La Boule d'Or, and Maréchal Niel. The third prize was awarded to Mr. C. Turner, his best blooms being Madame Margottin, Alba Rosea, Souvenir d'un Ami, and Innocente Pirola.

Classes were provided for collections of yellow, white, pink, crimson, and velvety-crimson Roses, three trusses of each, which were very interesting, though the entries were not numerous. With yellow Roses Mr. G. Prince was first, showing pretty examples of the following:—Comtesse de Nadaillac, Perle des Jardins, Sunset, Jean Pernet, Jean Ducher, Marie Van Houtte, Francisca Kruger, and Maréchal Niel. Messrs. G. Paul followed, having Madame Falcot, Maréchal Niel, Marie Van Houtte, Caroline Kuster, Sunset, and Jean Ducher in first-rate condition. Messrs. J. Barrett & Co., Home House Nursery, Cambridge, were third; Anna Ollivier, Perle des Jardins and Princess of Wales being of especial merit.

Five stands of white Roses were entered, but two were disqualified for containing blooms of pink varieties. Mr. B. R. Cant won the leading prize with a charming collection, comprising fine blooms of Madame Lacharme, Innocente Pirola, Niphotos, Violette Bouyer, Devonensis, and Merveille de Lyon. Mr. W. Rumsey followed, staging Souvenir de Malmaison, Souvenir d'Elise Vardon, Madame Lacharme, Merveille de Lyon, Niphotos, Alba Rosea, and Madame Hippolyte Jamain.

Pink Roses were handsomely represented in eleven stands, all of nearly equal merit. Messrs. G. Paul & Son were accorded first honours for admirable examples of Princess Beatrice, Lady Mary Fitzwilliam, Baroness Rothschild, Marguerite de St. Amand, Abel Grand, Madame Alice Durer, Madame Eugène Verdier, François Levet, Duchesse de Vallombrosa, Mons. Noman, Marquise de Castellane, Julie Touvais, and Madame Gabriel Luizet. The second place was secured by Mr. B. R. Cant, who had Madame Gabriel Luizet, Mons. Noman, La France, Marguerite de St. Amand, and Marie Cointet in capital form. Mr. J. Mattock, New Headington, was third, having Catherine Mermet, Mons. Noman, Princess Mary of Cambridge, Madame Isaac Perrière, and La France very fine.

The best crimson Roses were from Messrs. G. Paul & Son, who took the lead in the class with excellent richly coloured blooms of Maréchal Vaillant A. K. Williams, Duc de Roban, Star of Waltham, Beauty of Waltham, Marie Rady, Alfred Colomb, Dr. Andry, Mons. E. Y. Teas, Leon Renault, Marie Baumann, Jean Sury, Camille Bernardin, Madame Victor Verdier, and Comte de Raimbaud. Messrs. Bunyard & Co., Maidstone, were second with smaller, but neat and bright blooms, amongst which Dupuy Jamain, Sir Garnet Wolseley, Le Havre, and Richard Laxton were the best. The third place was taken by Mr. W. Rumsey. Messrs. Bunyard were well to the front with velvety crimson Roses, contributing substantial and brilliantly coloured blooms of the following:—Abel Carrière, Duke of Edinburgh, Eugène Fürst, Duke of Connaught, Charles Lefebvre, Xavier Olibo, Sultan of Zanzibar, Prince Camille Bernardin, Duke of Wellington, Fisher Holmes, Horace Vernet, Charles Darwin, Prince Arthur, and Rosieriste Jacobs. Mr. B. R. Cant, who was second, showed Reynolds Hole, Louis Van Houtte, and Xavier Olibo in excellent condition; Mr. W. Rumsey being again third.

Another group of classes was devoted to particular varieties or others of similar colour, and like the preceding were extremely interesting. For eighteen trusses of any Tea or Noisette, Mr. F. Cant won chief honours, having Souvenir d'Elise Vardon extremely fine in form and substance. Mr. B. R. Cant was second, also with the same variety, the blooms not quite so large but very even. Messrs. G. Paul & Son followed with Jean Ducher. All the prizewinning stands in this class were distinguished by the freshness and neatness of the blooms. There was only one stand of eighteen Maréchal Niel, from Mr. B. R. Cant, and for which the second prize was awarded, the blooms being rather small. There were eight competitors with eighteen trusses of François Michelin or similar coloured Rose, Messrs. G. Paul taking the first place with Ulrich Brunner, and Cranston Nursery Company, Hereford, were second with the same variety. The blooms in the first stand were exceedingly fine, and well merited the prize. When the class was first judged the second prize was given to a stand of Etienne Levet, but as it was subsequently found that this was also from Messrs. Paul & Son, it was removed, Messrs. Cranston's stand being advanced to the second place, and Mr. F. Cant to the third.

Nine boxes of Marie Baumann were entered, and all the prizewinners—namely, Mr. B. R. Cant, Messrs. G. Paul & Son, Messrs. Hugh Low & Co., Enfield, and Messrs. G. Bunyard & Co. showed that variety, the Colchester blooms being, however, much superior to the others. Prince Camille de Rohan was not so well shown, Messrs. Paul & Son being first with Abel Carrière, very fine, and Messrs. H. Low & Co. second for the only stand of the Prince.

The beautiful Rose Lady Mary Fitzwilliam is fast coming into favour as an exhibition variety, and it was not therefore surprising to find that in the class specially provided for it some fine examples were contributed. Thirteen stands of magnificent blooms were staged, and most appropriately Mr. W. Bennett, Shepperton, secured leading honours with large and handsome examples of the variety named. S. P. Budd, Esq., Bath, was second with La France, Mr. B. R. Cant being third with Baroness Rothschild. The best of the five boxes of A. K. Williams was that from Messrs. G. Paul and Son, who had some grand blooms. Mr. G. Monnt and Mr. W. J. Grant were second and third. Messrs. F. Cant, B. R. Cant, and G. Prince were the prizetakers for eighteen blooms of Niphotos, those in the first stand being very handsome, but the others were smaller and not of a remarkable character. The bright orange-coloured and distinct William Allen Richardson was exhibited by eight competitors, all the blooms being very bright. Messrs. House, Paul & Son, and G. Bunyard secured the prizes, the Peterborough blooms being extremely fine. For twelve bunches of Rosa polyantha there were only two exhibitors, Mr. G. Prince leading with charming

blooms of Anna Maria de Montravel, Mignonette, and Paqueritte, Mr. G. Mount having similar varieties, with the addition of The Pet, a white-flowered form. No exhibits of Rosa rugosa were staged in the class provided for it.

AMATEURS' CLASSES.—Amateurs showed very well, and it was observable that taking their stands generally there was greater evenness than in the open classes, while the blooms in many cases were equally as fine. There were thirteen competitors with forty-eight single trusses; Mr. Ridout, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, gaining the premier prize with a most handsome collection, the blooms very even, of good substance, and exceedingly bright. The varieties were Etienne Levet, Camille Bernardin, Charles Darwin, Marie Verdier, Pride of Waltham, Beauty of Waltham, La France, Duke of Teck, Marie Van Houtte, François Michelin, Marie Rady, Madame Isaac Perrière, Marie Baumann, Lady Mary Fitzwilliam, Alfred Colomb, Madame Gabriel Luizet, Madame Victor Verdier, a pink sport from Madame C. Joigneux; Edouard Morren, Victor Verdier, Dr. Andry, Violette Bouyer, Auguste Rigotard, Mons. E. Y. Teas, A. K. Williams, Emily Laxton, Le Havre, Marquise de Castellane, Madame Lacharme, Louis Van Houtte, Duchesse de Vallombrosa, Mrs. Baker, Mons. Noman, Ulrich Brunner, Heinrich Schultheis, Horace Vernet, Merveille de Lyon, Mrs. Laxton, Baronne de Rothschild, Magna Charta, Dupuy Jamain, Duke of Wellington, Charles Lefebvre, Capitaine Christy, Xavier Olibo, Countess of Oxford, Comtesse de Choiseuil, and Duchesse de Caylans. Second honours were accorded to the Rev. J. H. Pemberton, Havering atte Bower, Romford, for grand blooms, but some were rather full. Mr. A. Slaughter, Jarvis Villa, Steyning, was third, amongst his best blooms being an extremely fine example of Dr. Hogg.

A class was constituted for twenty-four varieties, single trusses, Hybrid Perpetuals only, and the non-observance of this stipulation compelled the Judges to reluctantly disqualify a stand which contained some Tea Roses, the collection being as a whole superior to those which gained the prizes. Of the four competitors Mr. R. Gray, gardener to Earl Stanhope, Chevening, Sevenoaks, was first with the following varieties, the blooms very fresh and bright:—Marguerite Brassac, Comtesse de Rosebery, François Michelin, Horace Vernet, A. K. Williams, Mons. Noman, Etienne Levet, Madame Gabriel Luizet, Alfred Colomb, La France, Duke of Edinburgh, Louis Van Houtte, Duke of Teck, Madame Victor Verdier, Merveille de Lyon, Marguerite de St. Amand, Duchesse de Vallombrosa, Abel Carrière, Marie Baumann, Marquise de Castellane, Marie Finger, Marie Rady, Mons. E. Y. Teas, and Madame Charles Wood. The other prizes were awarded to Mr. G. Christy, Westerham, Kent, and to Mr. R. E. West, Reigate, in the order named.

With twenty-four triplets Mr. T. W. Girdlestone, Sunningdale, won the principal honours for handsome, substantial blooms, of which the most notable were Etienne Levet, Ulrich Brunner, Madame Prosper Laugier, Souvenir d'Elise Vardon, General Jacqueminot, and A. K. Williams. Mr. J. Brown, gardener to A. J. Waterlow, Esq., Great Doods, Reigate, was second, Ulrich Brunner and Mons. Noman being remarkably fine; and the Rev. J. H. Pemberton was third. Mr. E. B. Lindsell, Hitchin; Mr. J. Brown; Mr. E. Wilkins, Lyndhurst, Sntton; and Mr. E. M. Bethune, Denne Park, Horsham, were the prizetakers with twelve varieties of H.P.'s; while with the same number of Teas Mr. A. Slaughter, Mr. Bethune, and the Rev. H. Berners, Harkstead Rectory, Ipswich, were the most successful, all showing good blooms.

PLANTS AND FLOWERS.—In addition to the classes for Roses, five were devoted to plants and flowers, the most important being that for a group of Tuberous Begonias to occupy a space of 100 square feet. Messrs. J. Laing and Co., Forest Hill, had a grand collection of their celebrated Begonias, which were arranged in a pyramidal form with Palms and Ferns, constituting a most imposing group at one end of the Rose tables, and comprising all the best of the numerous fine varieties raised in that establishment, about 250 plants being staged. Mr. H. Coppin was placed second. Mr. C. Turner was the only exhibitor of Lilliums, and was awarded the first prize for six good plants of L. auratum. There was not a remarkable display of Carnations and Picotees. Messrs. Turner, Douglas, and Hooper of Bath taking all the prizes.

MESSRS. W. PAUL'S ROSES.—In the opposite nave to that containing the Roses in competition was an extraordinary exhibition by Messrs. W. Paul & Son, Waltham Cross, which will be maintained in its present condition for a week. Three large tables, each about 40 feet long, are filled with cut blooms arranged in baskets or stands, and having a most graceful effect, far superior to the orthodox method of showing Roses in formal boxes. In the centre of the nave are handsome groups of Roses in pots, charming dwarf profusely flowered plants, which with a margin of Selaginellas, tall Ferns, and Palms being interspersed amongst the Roses, have a most novel and pleasing effect. Nearly the whole collection of Roses grown at Waltham Cross—namely, 700 to 800 varieties, is represented, and there is about the same number of plants, while there cannot be much less than 10,000 blooms. Altogether it is a remarkable exhibit, and attracted equally as much attention on Saturday as the competing stands. It will no doubt induce many rosarians to visit the Palace during the present week.

MISCELLANEOUS.—There were not many non-competing groups shown, but Messrs. H. Cannell & Sons, Swanley, contributed an extensive and beautiful collection of hardy flowers, Pelargoniums, Tuberous Begonias, and other treasures from the "Home for Flowers." Mr. W. Bennett, Shepperton, exhibited stands of his Roses Her Majesty and Mrs. John Laing, the latter being certificated. Messrs. Cheal & Sons showed a collection of hardy flowers, and Messrs. Cooling & Son, Bath, had some Tea Roses.

A certificate was awarded for the following:—
Rose Mrs. John Laing (W. Bennett).—A pedigree seedling H.P. Rose of the François Michelin build, globular in form, of great substance, lively pink in colour, and possessing an exquisite fragrance like the old Cabbage Rose. It is a grand variety, and was much admired both at the Palace and Sunbury, where it was certificated a few days previously. It was shown a season or two ago, but had not then developed its best characters.

HITCHIN.

THE fifth annual Exhibition of this Society, one of the most promising and vigorous affiliations of the National Society, was held in the pretty

grounds of the Priory on Thursday last. The competition was spirited and well kept up in nearly all the classes, there being six entries in the open forty-eights, but owing to the fixture clashing with Bath and other important attractions on the same day, and probably also to the frequently recurring

this progress the local growers are largely indebted to the effective influence of the Society's work and its liberality in offering prizes open to all England, and which has been this season extended by the opening of all the prizes to members of the Society or others without respect to residence the result

Fig. 5.—CYMBIDIUM LOWIANUM. (See page 28.)

cold nights of the previous period of ten days, some strong battalions were not able to show their colours. The Roses, although not including such dashing blooms as those shown by Mr. House last year, were, however, on the whole generally of a higher standard and much more even than at any of the previous shows at Hitchin, the staging, too, being greatly in advance of the primitive attempts formerly noticeable here at the early shows. For

fortunately not having brought discouragement to the Committee and their zealous Hon. Secs., the Revs. E. T. Carey and W. H. Gall. The latter, than whom there can be no more ardent devotee to the Rose, was on this occasion a redoubtable, although not a successful, exhibitor in the lists; but as the possessor of a pure white buttonhole of the famous and costly Gloire Lyonnaise deserves a note of admiration. Possibly it may have been a sport from that dazzling gem, but although many were the conjectures as to the name of the stranger it remained unrecognised, all the features of the craved yellow H.P. being absent. Tea Roses were as usual here an important attraction, the Revs. Dr. King and W. H. Jackson being deservedly honoured. Dr. King showed blooms of *Souvenir de Thérèse Levet*, a veritable Tea of a dark fruity crimson colour and appearance, with stout petals, a very striking and distinct Rose, but too heavy in colour to harmonise with the delicate tints of *Teas* and *Noisettes*, the deepest tone admissible amongst these being the pale carmine of *Madame Lambard*. Mr. House had also a good bloom of *Lanetta*, a prettily shaped cream-tinted Tea, and the Hon. Edith Gifford appeared to advantage as an exhibition flower. *Duchesse de Vallombrosa* has never been so fine, the present season seeming to suit it exactly; on the contrary, good blooms of *Alfred Colomb* were few and far between. *Heinrich Schultheis*, a carminated pink H.P., and *Lady Mary Fitzwilliam*, a fine hold flower of Mr. Bennett's, were both well shown, the latter giving the impression of a cupped and improved *Souvenir de la Malmaison*, the foliage, too, having something of the *Bonrbon* character. Mr. Laxton of Bedford staged a box of his pretty new flush seedling *Bedford Belle*, a very free-flowering and distinct new Rose, which attracted much attention.

For the class of forty-eight distinct Roses, open to all England, Mr. T. House of Peterborough was first, having fine specimens of *Violette Bouyer*, *Lady Mary Fitzwilliam*, *Mlle. G. Luizet*, *Duke of Edinburgh*, *Merveille de Lyon*, *Emily Laxton*, *Charles Darwin*, *Ulrich Brunner*, *Duke of Teck*, *Prince Camille de Rohan*, and *Catherine Bell*, a nice-looking H.P., intermediate in colour and appearance between *John Hopper* and *Coupe d'Hébé*. Mr. Atherton of the Nurseries, Chatteris, was creditably second, and closely

followed by Messrs. E. P. Francis & Co., Hertford. For twelve Teas in the open class Mr. House stood well first, having very beautiful flowers of Catherine Mermet, Comtesse de Nadaillac, Niphotos, Alba Rosea, and J. Ducher. In the class for thirty-six distinct Roses, open to all England, amateurs, the Rev. W. H. Jackson of Stagsden Vicarage, Bedford, was prominently foremost and received the first prize, having amongst his best blooms La France, Marie Baumann, François Michelin, Duchesse de Vallombrosa, Charles Darwin, Etienne Levet, and Maréchal Niel, very good. Mr. J. T. Curtis of Chatteris was second with very fresh blooms, including in his best A. K. Williams, Lord Macaulay, and La France; and the Rev. E. L. Fellowes of Wimpole Rectory, Royston, approached closely as third. In the class for twenty-four blooms, open to members of the Hitchin Rose Society, Mr. E. B. Lindsell of Bearton, Hitchin, had in his first-prize stand remarkable blooms, including Mdle. G. Luizet *couronnée* with the bronze medal of the National Rose Society as the best amateur's H.P. in the Show, Countess of Oxford, Duchesse de Vallombrosa, Marie Baumann, Louis Van Houtte, Etienne Levet, and Devoniensis. Mr. Jackson was here second and Mr. Fellowes third. For twelve blooms, open to members, Mrs. Lawson of the Manor House, Lilley, Herts, was first. The Rev. Dr. King of Madingley Vicarage, Cambridge, taking with a fine flower of Niphotos the National Rose Society's bronze medal for the best Tea; the silver medal going to Mr. S. Tuke of St. Ippolyts, Hitchin, for the best nine Teas; the Rev. F. Fox Lambert of Clothall coming second. For eighteen Teas, open to all amateurs, the Rev. Dr. King was first and the Rev. W. H. Jackson second; and for the prize for twelve Teas offered by Mr. George Paul, open to members, the Rev. W. H. Jackson was awarded first and Dr. King second; the Rev. F. Jenyns, Knebworth, and Mr. Fellowes taking prizes also in the two last classes. The ladies' prizes for epergnes, baskets, and buttonholes were well contested and the arrangements very tasteful, the chief prizes in these classes falling to Miss M. Ransom, Mrs. E. B. Lindsell, and Miss Grace Lucas.

The day was very fine and the Show in all respects a successful one, the proverbial affability, cordiality, and hospitality of Hitchin contributing much to make all things go smooth. Another feature is that the management knows how to keep the outgoings within the bounds of income; exhibitors under these circumstances may be expected at Hitchin again.

REIGATE.—JULY 2ND.

FAVoured with charming weather, and with the delightful surroundings of one of the most charming places in a neighbourhood so full of delightful places as Reigate is—in the grounds of Great Doods, the residence of A. J. Waterlow, Esq., the annual Exhibition of this well-known and energetic Society was held on Thursday last, and proved to be a great improvement on that of last year, and indeed was the best that I remember in the years that I have been privileged to act as Judge at the Show; for although the Tea Roses were certainly not up to the Reigate mark, which has always been famous for them, the general quality of the flowers was excellent. The box of twenty-four shown by Mr. Slaughter, and that of twenty-four Teas shown by Mr. Prince, could hardly have been surpassed, but amidst all that was bright and beautiful, there was in, I believe, all who had ever been at Reigate before, a feeling that there was a cloud over us, that it lacked something to make it what it used to be, and that the vacant space caused by the death of their former President, Mr. G. Baker, was never likely to be filled up. There are many kind, hospitable, and enthusiastic lovers of the Rose there, but he was so thoroughly *facile princeps*, that his loss has indeed been a severe one. I think, too, many felt the state of suffering in which the owner of the place, Mr. A. J. Waterlow, was, not enabling him to see the scene which, through his kindness, existed in his own grounds.

In class 1, for thirty-six distinct blooms, open, the first prize was awarded to Messrs. Paul & Son for a stand containing good blooms of Senateur Vaisse, Captain Christy, Abel Carrière, La France, Henrich Schultheis, Madame Gabriel Luizet, Madame Prosper Laugier, Abel Grand, Reynolds Hole, Madame Nachury, Marquise de Castellane, Hero of Waltham, Camille de Rohan, Centifolia Rosea, Madame Bernardin, Lady Mary Fitzwilliam, Duke of Edinburgh, Etienne Levet, Duke of Teck, Duke of Wellington, Countess of Oxford, Merveille de Lyon, Madame Victor Verdier, Mons. Noman, Beauty of Waltham, Pride of Waltham, Xavier Olibo, Marie Cointet, Pride of Reigate, the curious shaped Rose raised by Mr. J. Brown; François Louvat, A. K. Williams, Violette Bouyer, Prince of Wales, Marie Verdier, Mons. E. Y. Teas, and Clothilde Rolland. Mr. Piper was second. In class 2, for twenty-four Teas, Mr. Prince was easily first with a lovely stand which fully maintained the widely known reputation of the Oxford firm for Tea Roses. They were—Comtesse de Nadaillac, of which also he had a most lovely stand of twenty-four; Anna Olivier, Souvenir d'un Ami, Alba Rosea, Catherine Mermet, Hon. Edith Gifford, Maréchal Niel, Souvenir d'Elise Vardon, Madame Caroline Kuster, François Kruger, Niphotos, Perle des Jardins, Devoniensis, Jean Ducher, Merveille de Lyon, Rubens, Marie Van Houtte, Souvenir de Madame Pernet, Innocente Pirola, Marquise de Sanuria, Madame Hippolyte Jamain, Amazon, Prince of Wales, and La Princesse Vera. Messrs. Paul & Son were second. In class 3 Mr. Waterlow was first with Lady Mary Fitzwilliam, Victor Verdier, Marie Finger, Countess of Oxford, La France, Etienne Levet, Madame Gabriel Luizet, Louis Van Houtte, Magna Charta, Camille Bernardin, Madame Montet, Mrs. Baker, Baroness Rothschild, Cheshunt Hybrid, Catherine Soupert, Charles Darwin, Marquise de Castellane, Ulrich Brunner, Madame Isaac Pereire, Marie Baumann, Mons. Noman, Duke of Teck, Madame Victor Verdier, A. K. Williams, Mrs. Poole, Mrs. Laxton, John Hopper, Dupuy Jamain, Madame Cointet, Duchess of Bedford, Princess of Wales, Le Havre, Auguste Rigotard, Violette Bouyer, Madame Prosper Laugier, and Duke of Wellington. In class 6 Mr. Slaughter was first with Marie Rady, La France, A. K. Williams, Camille Bernardin, Louis Van Houtte, Duchesse de Caylus, Maurice Bernardin, Marguerite de St. Amand, Marquise de Castellane, Duchess of Bedford, Marie Baumann, Charles Lefebvre, Auguste Rigotard, Horace Vernet, Etienne Levet, Alfred Colomb, Countess of Rosebery, Jean Liabaud, Marie Verdier, Fisher Holmes, E. Y. Teas, Madame Gabriel Luizet, Général Jacqueminot, and Prince Arthur. This was a very grand box, indeed there was not an indifferent bloom in the box. Mr. Haywood was second with an excellent box. In class 7, eight trebles, Mr. Haywood was first with excellent blooms of Marie Verdier, Dupuy Jamain, La France, Marquise de Castellane, Marie Baumann, Gabriel Luizet, Charles Lefebvre,

and Violette Bouyer. Mr. Slaughter was second in class 8 for the best box of blooms of any one variety. Mr. Haywood was first with fine blooms of A. K. Williams, and Mr. Slaughter second with good blooms of La France. In class 9, for twelve Teas, Mr. Slaughter was first with good blooms of Belle Lyonnaise, Souvenir d'un Ami, Jean Ducher, Anna Olivier, Rubens, Madame Willermoz, Maréchal Niel, Alba Rosea, Etoile de Lyon Homère, Catherine Mermet, and Jean Pernet.

In class 10, for amateurs residing within ten miles of Reigate, the first prize for twelve went to E. M. Bethune, Esq., for Henri Ledechaux, La France, Dupuy Jamain, Ferdinand de Lesseps, Annie Laxton, Madame Gabriel Luizet, Louis Van Houtte, Auguste Rigotard, Marie Baumann, Madame Eugène Verdier, Beauty of Waltham, and A. K. Williams. In class 11, for six varieties, Mr. Ponsford was first with Duke of Edinburgh, Star of Waltham, Countess of Rosebery, Prince Camille de Rohan, Général Jacqueminot, and Baroness Rothschild. In class 12, for six trebles, Mr. Ernest Williams of Lyndhurst, Sutton, was first with Emily Laxton, Marquise de Castellane, Duchess of Vallombrosa, Madame Gabriel Luizet, Charles Lefebvre, and Marie Rady. In class 13, for six of any one variety, Mr. E. M. Bethune was first with La France. There were a number of fine stands exhibited in this class. In class 14, for Teas, Mr. E. M. Bethune was first with a good box containing amongst others a nice bloom of Grace Darling, and in the class for six Teas Mr. W. D. Freshfield was first with Maréchal Niel, Madame Lambert, Catherine Mermet, Souvenir d'un Ami, Caroline Kuster, and Perle de Lyon. The gold medal of the N.R.S. for the best box in the Show was awarded to Mr. Slaughter, the silver medal for the best box in the local classes.—D., Deal.

NEW BRIGHTON.—JULY 4TH.

This was held on the date named at St. George Mount, New Brighton, belonging to W. Bell, Esq., the active Hon. Sec., and a good one it was. The entries in the amateurs' classes especially were not so numerous as last year, owing to the very early appointment of the Exhibition, especially when the district is considered and the late season; for last year the Show was only one day later, and the entries were much more numerous. As an instance of the lateness of the season around Liverpool, mention may be made of the fact that at the day of the Show the Secretary had only about half a dozen Roses in bloom in his garden, whereas last year he staged in several classes. It was important, too, for the Liverpoolians that the Show should be held on the Saturday; indeed, this was essential to insure the success of the venture. The difficulty was, therefore, to arrange the time without clashing with other Shows; but although the exhibits were not so strong numerically, the character of most was first-rate, both in the amateur and nurserymen's classes. As is his wont, Mr. T. B. Hall scored the highest distinction in the former, his blooms being in excellent form and colour. The stands of Teas and Noisettes could not be over-praised; indeed, we doubt whether the Exhibition held at the Crystal Palace the same day included any finer than those culled from the Liverpool district, as murky and often sunless as it is. They were simply perfection. Judging from the patronage at the early hour we left the ground we should think the affair a success in every way.

NURSERYMEN'S CLASSES.—In the premier class for forty-eight blooms, each one distinct, there were two magnificent collections staged, almost equal honours were merited. Messrs. Cranston & Co., Hereford, were first, their flowers having an advantage in colour and earliness. The second prize was awarded to Messrs. F. & A. Dickson, Upton Nurseries, Chester, who staged a superb collection, the colours being more diversified than in the Hereford stands. The following varieties constituted the leading collection. Back row.—Merveille de Lyon very fine, Mdle. Marie Rady, Mad. Hippolyte Jamain, Fisher Holmes grand, Pride of Waltham, Dupuy Jamain, Lady Mary Fitzwilliam, Mad. Chas. Crapelet, Alfred Colomb, Earl of Pembroke, Lælia, Mad. Chas. Wood a magnificent bloom, Constantine Tretia-koff, Violette Bouyer, Duke of Edinburgh, and Le Havre. Second row.—Sultan of Zanzibar, Mad. Gab. Luizet, Dr. Andry, Madame Thérèse Levet, Mons. E. Y. Teas splendid, Gloire de Dijon, Rosieriste Jacobs, Antoine Ducher, Henrich Schultheis, Baroness Rothschild, Mrs. Jowitt, Mons. Alfred Dumesnil, Auguste Neumann, Beauty of Waltham, Mad. Bravy, Alfred K. Williams fine. Front row.—Marquise de Castellane, Jules Chretien, Duchesse de Vallombrosa, Duke of Wellington, Monsieur Noman, Barthélemy Joubert, Mdle. Marie Cointet, Lord Macaulay, Elie Morel, Mad. Ducher, Marquise de Mortemart, Mons. Etienne Levet, Souvenir d'un Ami, Maurice Bernardin, Annie Laxton, Marguerite de St. Amand excellent. The finest flowers in Messrs. F. & A. Dickson's collection were Lady Mary Fitzwilliam, Mdle. Eugénie Verdier, Mad. Hippolyte Jamain, Crown Prince, Ulrich Brunner fils, Annie Laxton, Princess Beatrice, Mdle. Veuve, Alexandre Pommery, Merveille de Lyon, A. K. Williams, Baroness Rothschild, and Niphotos, all of which were as fine as could be desired.

For twelve varieties, three blooms of each, the same exhibitors staged very fine lots. Messrs. F. & A. Dickson of Chester were this time well to the front with the following varieties, nearly all in first-rate condition:—Monsieur Noman, François Michelin, La France splendid blooms, Ulrich Brunner fils, Merveille de Lyon very large and perfect, Emily Laxton, Madame Gabrielle Luizet, Madame Laurent, Lady Mary Fitzwilliam excellent, Annie Laxton, Elie Morel, and Marquise de Castellane. The best truss in Messrs. Cranston's collection were Merveille de Lyon, Madame Chas. Wood again unusually fine, Mons. E. Y. Teas, Madame Furtado, Comtesse de Paris, and Maurice Bernardin. For twelve Teas or Noisettes Messrs. Cranston were first, theirs being the only collection staged; the best flowers were Devoniensis very good, Madame H. Jamain, Comtesse Riza du Parc and Madame Willermoz. For twelve named varieties, open only to nurserymen in the Wirral district, Mr. S. Johnson of Oxtun was first, the only lot staged.

AMATEURS' CLASSES.—In that provided for twenty-four varieties, single blooms, for which the National Rose Society's gold medal and £2 in cash was the first prize, the premier award fell to T. B. Hall, Esq., Larchwood, Rock Ferry, who staged a first-class collection, some extraordinarily fine for so early in the season. Back row.—Marie Baumann especially good, Madame Gabrielle Luizet, Olivier Delhomme, Perle des Jardins, Marquise de Castellane, Innocente Pirola splendid, A. K. Williams, Annie Laxton extremely fine. Middle row.—Lady Mary Fitzwilliam, Charles Lefebvre, Catherine Bell a splendid light Rose, Souvenir d'Adolphe Thiers, Dingé, Conard very good, Mons. Noman, Violette Bouyer, Général Jacqueminot,

Long Bacon, Reine Marie Henriette, Duke of Wellington, Marie Van Houtte, Constantin Tretiakoff, Safrano, Comtesse d'Oxford, and Madame Noman. The second collection was staged by Rev. L. Garnett, Christleton, Chester, whose best flowers were Catherine Mermet, Baroness Rothschild, excellent, Marie Van Houtte, François Michelin, Marie Finger, and La France, a magnificent bloom. Mr. Hall was again first for eighteen varieties, and Rev. L. Garnett of Christleton second, both staging good lots. The premier collection were excellent, particularly the following:—Gloire de Dijon, Madame Gabrielle Luizet, Marie Baumann, Catherine Bell, Souvenir de Malmaison, and Dingee Conard. For twelve blooms, any light variety, and a similar exhibit of any dark variety, Mr. Hall was first in each class, staging Catherine Bell and Dingee Conard respectively, both stands being very fine, particularly the twelve dark blooms, Dingee Conard being a very fine variety.

For twelve Tea or Noisette varieties the National Rose Society's silver medal, in addition to cash, was offered. Three superb stands were staged, any of which merited the leading prize. The first award, however, fell to Ecrovde Claxton, Esq., Allerton, whose blooms were magnificent, the collection included the following:—Caroline Kuster, Madame Cusin, Princess of Wales, Souvenir d'Elise Vardon, Alba Rosea, Comtesse de Nadaillac, Souvenir d'un Ami, Innocente Pirola, immense; Madame Hippolyte Jamain, Catherine Mermet, David Pradel, Amazone. Second, T. B. Hall, Esq., with a splendid lot; Innocente Pirola, Perle des Jardins, President, and Marie Van Houtte were especially good.

In the class for six varieties M. Bullay, Esq., was a good first with splendid blooms of Madame Cusin, Innocente Pirola, very large; Souvenir d'Elise, Marcellin Rhoda, Etoile de Lyon, and another not named; and W. Hall, Esq., second.

The miscellaneous exhibits added materially to the attractions of the Show, notably the three boxes of Roses, thirty-six varieties of herbaceous Pæonies and hardy flowers staged by Messrs. James Dickson & Son, Newton Nurseries, Chester. We scarcely knew which to admire most, the Pæonies or Roses, but the palm must be given to the queen of flowers. Messrs. F. & A. Dickson, Chester, staged an admirable collection of twenty-four Pæonies, which were greatly admired. Mr. S. Johnson, South Grove Nurseries, Oxton, had a fine group of foliage and flowering plants, Palms, Crotons, Dracænas, Pelargoniums, Gloxinias, Rhodanthe Manglesi, Liliun eximium, &c., as well as boxes of Pæonies, Pelargoniums, and Roses. Ecrovde Claxton, Esq., Allerton, showed a beautiful stand of ten Roses; especially praiseworthy were twelve blooms of Madame Cusin, also David Pradel and Madame H. Jamain.

CARDIFF.—JULY 1ST.

THIS was held in the Drill Hall, Cardiff, on July 1st. It was the fifth annual Show, and the only real Rose Show held in Wales. At the first, we can remember, the exhibits were very few and the attendance small—not by any means an encouraging beginning, but this did not deter the indefatigable Hon. Sec., Mr. Pettigrew, and a well organised Committee from pushing on with their good work, and the Show under notice was a great success in every respect, there being numerous exhibitors, local, and from a distance, a gorgeous display of blooms, and a good attendance of the public. The Hall is a spacious one, well lighted, and admirably adapted for a flower show and promenade. The Roses occupied two rows of tables in the centre, and others were staged along the sides, and the floral display was greatly enhanced by lines and groups of beautiful flowering and fine-foliaged plants from Cardiff Castle. These were a show in themselves, and added much to the general effect.

Coming to the Roses, we need not give a list of the names of the blooms in each collection, as these included all the best forms in cultivation, conspicuous amongst which were Duchess of Connaught, Lady Mary Fitzwilliam, Duke of Albany, Countess of Pembroke, Merveille de Lyon, White Baroness, Earl of Pembroke, Mary Pochin, Abel Carriere, Alfred Colomb, Duchess of Bedford, Marie Baumann, Marquise de Castellane, Violet Bowyer, Alba Rosea, Jean Ducher, Madame Lambard, and Princess of Wales. These were the cream, and a grand cream too. Merveille de Lyon was shown in many of the stands; the Cranston Company, Hereford, exhibited a special box of it, and in every instance it was magnificent. One local nurseryman, Mr. Crossling of Penarth, had it so fine that a visitor was so captivated that he ordered a dozen plants there and then. La France was numerous and much admired; A. K. Williams, although there in plenty, gave one the impression of being a too-much-praised Rose.

Local nurserymen and exhibitors generally from South Wales hardly came up to their opponents from Bath, Torquay, Hereford, and other places, the lateness of the season telling very much against the former. One extensive Rose-grower near Cardiff told us he had not a bloom open three days before the Show, and it was only after twenty-four hours' sunshine on the two preceding days that he was enabled to cut a few dozens. This shows the disadvantage under which many exhibited, and yet it must be understood their exhibits were far from discreditable; indeed many of those who have shown since the Society exhibited have grown with it, and would, under favourable conditions, hold their own in any part of the country.

In the nurserymen's class, open, for forty-eight varieties, Messrs. Cranston, Hereford, were first; Messrs. Curtis, Sanford & Co., Torquay, second; and Mr. Stephen Treseder, Ely Road Nurseries, Cardiff, third. For twenty-four varieties Messrs. Cranston, Treseder, and Crossling were the prizewinners. In the South Wales open class for thirty-six varieties Mr. Steven Treseder was first, and Mr. Crossling, Penarth, a close second. In the open amateurs' class for twenty-four varieties Mr. J. Grant, Hope End, Ledbury, was a capital first with large finely formed, beautifully coloured blooms, which also gained him the gold medal of the National Rose Society; Mr. Pettigrew was a close second with well shown blooms. In the twelve varieties Mr. S. P. Budd, Bath, was first with excellent blooms, Mr. Grant, second, and Mr. Pettigrew, third. The above class was for three trusses of each variety. In the single twelves the Rev. H. Arkwright, Leominster, was first, Mr. Pettigrew second, and Mr. Budd third. In the groups of twelve blooms of one variety the honours were pretty well divided between Mr. Grant, Mr. Budd, Mr. Hobbs, Bristol, and the Rev. H. Arkwright.

In the amateur class, open to South Wales and Monmouthshire, the first prize for twenty-four varieties was taken by Mr. Moor, Cardiff, who also

secured the silver medal of the National Society with uncommonly fine blooms; Mr. Ryder, Cardiff, was second, and Mr. Pugsley, Penarth, third. In the class for twelve Mr. Fisher, Cardiff, was first, Mr. Pugsley second, and Mr. Armatage, Llandaff, third. Besides these gentlemen Mr. Case of Rumney secured some of the smaller prizes which followed in this section. The handsome prizes offered by the Marquis of Bute for the best box of blooms of the York-and-Lancaster Rose brought out some keen competition, Colonel Lee, Cardiff, being first, Mr. Moor second, and Mr. Pettigrew third, with a charming lot of buds which we preferred to the full open blossoms. The special prizes offered by the Mayor of Cardiff, Messrs. Treseder, Mr. Crossling, Mr. Thomas, Mr. Case, and others, were well competed for, the exhibitors being numerous, and the exhibits of considerable merit. Some very pretty bouquets were shown, and many dishes of Strawberries, as well as some new honey, the whole of which added greatly to the interest of a good and well managed Show.—A VISITOR.

BATH.—JULY 2ND.

OWING to the backwardness of the season a very superior display of cut Roses was hardly looked for at this early fixture, but on the whole the Committee had every reason to congratulate themselves upon the success of the meeting. A liberal list of prizes succeeded in attracting most of the leading nurserymen, including Messrs. Paul & Son, Cheshunt; B. R. Cant, Colchester; Keynes, Williams, & Co., Salisbury; Curtis, Sanford, & Co., Torquay, and the Cranston Nursery Company, and although none of these was able to exhibit in their usual superior style they yet made a very good fight for the premier positions. Local growers, including Messrs. George Cooling & Son, and S. P. Budd, Esq., were also very successful, while among amateurs from a distance the most conspicuous in the prize list were T. W. Girdlestone, Esq., Sunningdale, Berks; Captain Christy, Sidmouth; and Miss Watson Taylor. The weather was brilliantly fine and the attendance apparently very large as usual at Bath under similar circumstances.

NURSERYMEN'S CLASSES.—Four lots of seventy-two trusses, distinct, were shown, Mr. B. R. Cant being easily first. Included were fine fresh blooms of Prince Arthur, Madame Marie Cointet, Madame Ducher, A. K. Williams, Niphetos, Sultan of Zanzibar, Jean Ducher, Countess of Rosebery, Heinrich Schultheis, Madame Gabriel Luizet, Charles Lefebvre, Madame C. Kuster, Dupuy Jamain, Lady Mary Fitzwilliam, Mons. Alfred Dumesnil, Mons. E. Y. Teas, Souvenir d'Elise, Marie Baumann, La Boule d'Or, A. Colomb, Countess of Pembroke, Xavier Olibo, Annie Laxton, Reynolds Hole, Mdlle. Julie Dymonier, La Duchesse de Morny, and Marquise de Castellane. Messrs. Paul & Son were second, their stands containing many good blooms. Messrs. Keynes, Williams, & Co. followed closely.

With thirty-six triplets, distinct, there were the same number of competitors, and with these Messrs. Paul & Son took the lead, some of the best represented varieties being Horace Vernet, Heinrich Schultheis, Merveille de Lyon, Countess of Oxford, Madame Gabriel Luizet, La France, Prince Arthur, Grandeur of Cheshunt, C. Lefebvre, François Michelin, A. K. Williams, Captain Christy, E. Y. Teas, Ulrich Brunner, Mdlle. Prosper Laugier, Etienne Levet, Pride of Waltham, Camille Bernardin, and Senateur Vaisse. Mr. B. R. Cant was a good second. Messrs. Keynes & Williams were again a creditable third with varieties very similar to those in the other collections.

The best eighteen triplets were staged by Messrs. Curtis, Sanford, and Co., and among these were some of the finest blooms in the Show. Very good were General Jacqueminot, Marguerite de St. Amand, Duke of Edinburgh, Duchesse de Morny, Marquise de Castellane, Merveille de Lyon, Alfred Dumesnil, Marie Baumann, Mdlle. Gabriel Luizet, and Ulrich Brunner, a perfect bloom of the latter being awarded the silver medal of the National Rose Society offered for the best Hybrid Perpetual. Messrs. George Cooling & Son were a very creditable second, their best being Lady Mary Fitzwilliam, Dr. Sewell, Etienne Levet, Julia Touvais, Madame Victor Verdier, La France, Maréchal Niel, and Marquise de Castellane. Mr. J. Mattock, Oxford, was third. Messrs. Curtis, Sanford, & Co. were also first with eighteen trusses, distinct. Messrs. Cooling & Son followed with medium-sized fresh examples, and Mr. G. Mount was third, several others exhibiting creditably.

The competition with eighteen Teas or Noisettes, single trusses, distinct, was close and good. Mr. B. R. Cant took first prize with a generally excellent collection, consisting of Maréchal Niel, Souvenir d'Elise, Jules Finger, Innocente Pirola, Comtesse de Nadaillac, Souvenir de Paul Neyron, La Boule d'Or, Madame Caroline Kuster, Devoniansis, Catherine Mermet, Niphetos, Jean Ducher, Souvenir d'un Ami, Hippolyte Jamain, Anna Ollivier, Etoile de Lyon, Marie Van Houtte, and Moire. Mr. J. Mattock was a good second, his stand including lovely blooms of Amazone, Devoniansis, Paul Labonte, Rubens, Marie Van Houtte, and Perle des Jardins. The third prize was well won by the Cranston Company.

AMATEURS' CLASSES.—With thirty-six distinct varieties, single trusses, Mr. T. W. Girdlestone was easily first, many of his blooms being very substantial and good in colour. The best were Capitaine Christy, Maurice, Bernardin, Sultan of Zanzibar, Mary Bennett, A. K. Williams, Duke of Teck, Nachury, Baronne de Rothschild, Marie Finger, Lady of the Lake, Violette Bouyer, Mrs. Baker, La France, Crown Prince, Charles Lefebvre, Etienne Levet, Maréchal Valliant, Madame Gabriel Luizet, and Merveille de Lyon. Mr. S. B. Budd was a very good second, his blooms being somewhat smaller, but of good colour; and Miss Watson Taylor was third. Captain Christy took the lead with twenty-four trusses, distinct, having fairly good examples of La France, Abel Carriere, A. K. Williams, Duke of Edinburgh, E. Y. Teas, Thomas Mills, Maréchal Niel, and Dupuy Jamain. The Rev. C. Eddy, Bramwell Rectory, was a good second, and Mr. A. Evans, Oxford, third, and there were five other lots staged.

Mr. T. W. Girdlestone staged the best twelve triplets, distinct, his very creditable lot including Ulrich Brunner, La France, A. K. Williams, and other good sorts. Mr. S. P. Budd was a good second, and Miss Watson Taylor third. With six triplets, distinct, the prizewinners were the Rev. C. Eddy, Captain Christy, and Mr. J. Smith, Warminster; and with six singles, distinct, Mr. G. Tanner was first, Mr. J. Wills second, and the Rev. C. C. Layard third.

The best twelve Teas or Noisettes, single trusses, distinct, were staged by Mr. T. W. Girdlestone, this including very good blooms of Marie V Houtte, Rubens, Jean Ducher, Souvenir d'un Ami, Anna Ollivier, Souv

Elise, Madame Margottiu, Catherine Mermet, Belle Lyonnaise, and Niphetos, the last-named being also selected for the award of a silver medal for the best Tea in the Show. Miss Watson Taylor was a good second, and Mr. J. Grant, Hereford, third. With six Teas the prizewinners were Messrs. Narroay of Oxford, J. Smith, and G. Tanner.

LOCAL AMATEURS' CLASSES.—The competition in these was surprisingly poor, and Mr. S. P. Budd easily secured the award of the National Society's gold medal for a stand of twenty-four distinct varieties, included among which were good examples of Ulrich Brunner, Lady Mary Fitzwilliam, Dupuy Jamain, Countess of Rosebery, Merveille de Lyon, and Duke of Teck. The winners with twelve distinct varieties were Mr. F. Clerk, Rev. G. E. Gardiner, and Mrs. Horne, and with nine Teas Mr. S. P. Budd was again successful.

OPEN CLASSES.—In the classes for stands of one variety the competition was close, and many fine blooms were staged. There were twelve stands of twelve trusses of any Rose, Messrs. Paul & Son being placed first with Ulrich Brunner in fine condition. Miss Watson Taylor followed with a creditable lot of Catherine Mermet, and equal thirds were awarded to Mr. Cant and the Cranston Company, who respectively staged Marie Cointet and Merveille de Lyon, the latter being much discoloured. A moderately good stand of Maréchal Niel staged by Mr. Evans won the first prize for any yellow variety, the Cranston Company following with the same variety, and Miss Taylor was third with fairly good Belle Lyonnaise. The best stand of any crimson variety, Marie Baumann, fresh, and of good size, was staged by Mr. Cant, Curtis, Sanford & Co. following with Alfred Dumesnil, and the third prize went to the Cranston Company for A. K. Williams. Mr. Cant won the first prize for any pink variety with a good stand of the lovely Mdle. Gabriel Luizet, Messrs. Paul & Son following with the same variety, the third prize going to Mr. S. P. Budd for La France.

In the class for any new Rose of 1883 or 1884 Messrs. Curtis, Sanford, and Co. were easily first for Alphonse Soupert in excellent condition, the Cranston Company following with Merveille de Lyon, and Mr. Mattock was third with Lady Mary Fitzwilliam, which happened to be sent out in 1882.

As usual a large number of bouquets of Roses were staged. Messrs. Cooling & Son had the best twelve, these being very fresh and relieved with Moss Rosebuds and Rose foliage. The second prize lot staged by Mr. Mattock were very formal. Mr. W. C. Drummond, Bath, was third. In the amateurs' classes for six bouquets Miss W. Taylor was first; Mr. Warden, Clarendon Park, Salisbury, second; and Mr. J. Stuckey third, all displaying good taste. Messrs. Cooling & Son were also first for the most tastefully arranged basket of Roses, Mr. Mattock being second, and W. C. Drummond third.

FARNINGHAM.—JULY 1st.

In this pleasant little piscatorial village on the Darent the annual Show of Roses was held on Wednesday last, July 1st. With it was combined also a show of plants, table decorations, and cottagers' productions; but the Roses were the *pièce de résistance*, and although not equal in extent or quality of blooms to that of last year, a pretty show was brought together. The only nurseryman from a distance who exhibited was Mr. B. R. Cant from Colchester, but amateurs were fairly represented by those in the neighbourhood, where several good rosarians cultivate the queen of flowers. It ought to be a good district, and one was not surprised to see many good stands; still there was nothing that shone out pre-eminently above the others—no such Horace Vernets as Mr. Pemberton exhibited last year, or such blooms as Mr. Wakeley showed at Canterbury of Xavier Olibo. The Rev. F. R. Burnside, to whom the Society owes its existence, but who has now removed to Gloucestershire, brought his Roses from the western county and showed exceedingly well, while Mrs. J. M. Fuller of Bexley was rewarded for the care she bestows on her favourite flower by securing two first prizes.

In the class for thirty-six blooms, open to all comers who are members of the Society, Mr. B. R. Cant was easily first with a box containing the following flowers:—Marquise de Castellane, Catherine Mermet, John Hopper, Lady Mary Fitzwilliam, Edouard Morren, Madame Lacharme, Violette Bouyer (which has as yet this year been everywhere shown well), Beauty of Waltham, Niphetos (a very large bloom, reminding one of that shown by Mr. Jowitt some years ago at the Crystal Palace), Marie Baumann, Madame Marie Cointet, Dr. Sewell, Madame Alfred Dumesnil, Maurice Bernardin, Général Jacqueminot, Madame Bravy, Henri Schultzeis, Ulrich Brunner, La France, Madame Isaac Pereira, Madame Ducher, Mdle. Eugénie Verdier, Mrs. Baker, Marie Verdier, Duchesse de Vallombrosa, Charles Lefebvre, Madame Gabriel Luizet, Dr. Andry, Maréchal Niel, François Michelin, Duke of Teck, Annie Laxton, Souvenir d'Elise, Prince Arthur, and Dupuy Jamain. The second prize was awarded to Messrs. Longley of Rainham, and the third to Messrs. George Bunyard & Co., Maidstone. For twelve Teas Mr. B. R. Cant was again first with Comtesse de Nadailac, Souvenir d'un Ami, Marie Van Houtte, Catherine Mermet, Etoile de Lyon, La Boule d'Or, Madame Angèle Jacquin, Madame Hippolyte Jamain, Caroline Kuster, Niphetos, Maréchal Niel, and Souvenir d'Elise. Messrs. Longley were second, and Messrs. George Bunyard & Co. third. In the class for twenty-four varieties for amateurs and gardeners, Mr. W. H. Wakeley was first with an excellent stand containing Henri Ladechaux, Ferdinand de Lesseps, Marguerite de St. Amand, Dr. Andry, Caroline Kuster, Thomas Mills, Maréchal Niel, Marie Baumann, Charles Lefebvre, Madame Gabriel Luizet, Captain Christy, John Bright, Eugène Fürst, Innocente Pirola, Violette Bouyer, Duke of Edinburgh, Abel Carrière, Marie Van Houtte, Louis Van Houtte, Marquise de Castellane, Etienne Levet, François Michelin, Camille Bernardin, and Catherine Mermet. Mr. G. Christy was second, and Lord Stanhope third. In the class for twelve varieties Mr. R. E. West was first with François Michelin, Duke of Teck, Prince Camille de Rohan, Marie Finger, Baroness Rothschild, Abel Carrière, Annie Wood, A. K. Williams, Madame Eugène Verdier, Violette Bouyer, Madame Victor Verdier, Baroness Rothschild. The Rev. J. R. Burnside was second, and Mrs. Spottiswoode third. In the class for nine Teas the Rev. F. R. Burnside was first with a fresh and clean stand, consisting of Souvenir de Paul Neron, Hon. Edith Gifford, Jean Ducher, Souvenir d'un Ami, Madame Bravy, Madame Hippolyte Jamain, Rubens, Madame Willermoz, and Catherine Mermet. Mr. Julius Sladden of Badsey, Evesham, was second, and Mr. Wallis third. In the class for six of any one dark Rose Mr. R. E.

West was first with Annie Wood, Mr. G. Christy second with Duke of Edinburgh, and Earl Stanhope third with Charles Lefebvre. For the best six of any light Rose Earl Stanhope was first with La France, Mr. Wakeley second with Madame Gabriel Luizet, and Mrs. Fuller third with La France.

For the best twenty-four for amateurs and gardeners residing within ten miles of the village of Farningham Mr. J. Burnaby Atkins was first with La France, Duchesse de Vallombrosa, A. K. Williams, Marguerite de St. Amand, Marie Rady, Alfred Colomb, Duke of Edinburgh, Edouard Morren, Louis Van Houtte, Horace Vernet, Marie Van Houtte, E. Y. Teas, Madame Victor Verdier, Jean Ducher, Maréchal Niel, Maréchal Vaillant, Madame Clémence Joigneaux, Madame Gabriel Luizet, Charles Lefebvre, Heinrich Schultzeis, Marquise de Castellane, Comtesse d'Oxford, and Marie Baumann. The prize for the best twelve was awarded to Mrs. J. M. Fuller for a very beautiful stand, also for the best six Teas. The bronze medal for the best box in the open classes was awarded to Mr. W. H. Wakeley, the silver medal for the best box in the local classes to Mr. F. Burnaby Atkins, and for the best Rose in the amateur classes to Mr. W. H. Wakeley.—*D., Deal.*

CYMBIDIUM LOWIANUM.

SOME time ago we received a magnificent raceme of this Orchid from Dr. A. Paterson, who, amongst his other treasures, grows it uncommonly well in his Bridge of Allan collection. A reduced representation of this is given in fig. 5, page 28, but no real idea of its beauty can be conveyed in a wood engraving. The species has become a great favourite with growers chiefly on account of the great length of time the flowers last, which is astonishing, for some plants have been in good condition for fully six months; and a specimen which opened its flowers at Christmas was shown at one of the summer exhibitions of the Royal Botanic Society, when it was as fresh and beautiful as anyone could wish. The long racemes also have a graceful appearance, arching over the sides of the pots, especially when a slight support is afforded them. The flowers cannot be termed brilliant, but they are very striking, and the contrast of the yellowish or creamy sepals and petals with the reddish brown lip renders them remarkable. For exhibition the plant is admirably adapted, as it suffers much less than many of its relatives; and at the Orchid Conference in May it was very strongly represented.

VEGETATION AND FRUITS OF NEW BRITAIN.

AN interesting essay was read a short time since before the Society of Arts by Mr. Wilfred Powell, and in the course of a very full description of the customs of the inhabitants he thus refers to the vegetable products:—

The fruit of Duke of York Island consists of the Banana, Cocoa-nut, Tan, Mummy Apple, and a description of wild Mango. Yams and Taro are also grown on the island, but Sweet Potatoes are the chief product, and serve as one of the main articles of trade between this and the other islands. The Bananas also are in some parts of the island very fine, but the Yams and Taro are not to be compared with those of New Britain, or the Yams of New Ireland, which are noted for their large size. The Taro of New Britain is also considered the finest in the South Seas. Taro is a large bulb-like tuber, with leaves much of the shape of the Caladium. I have never seen the flower. There are two different kinds, one of which grows in swampy ground, and the other on the hill sides; the latter is the largest and best, the swamp Taro being waxy to eat. Taro is planted in rows about one pace apart, and is kept clear of weeds by the women; the hill Taro grows to the size of 15 inches long by 1 foot circumference. When cooked in a small quantity of water the starch that exudes from it makes the water into a thick paste, therefore it requires more water added continually, and when cooked is soft and mealy, and is one of the very best vegetables I have even eaten. The native way of cooking it is even better than boiling; the outside rough brown coating is scraped off with a sharp shell, and after cutting the Taro in halves lengthways, it is wrapped up in Banana leaves and placed on a fire where it is not too hot; when cooked it is much like good new bread, and is excessively nutritious. After taking the Taro out of the ground the tuber is cut off, leaving about an inch still adhering to the stalks and leaves, this is again placed in the ground, and in about three months has another large tuber ready for cutting. The leaves are terribly astringent, and are eaten raw, will take the skin off the mouth and render it very sore for some days, but the young leaves cooked are very delicious.

There is also a fruit called the "Tan," which I do not suppose many Europeans know much about. It grows on very high trees, whose wood, by the way, is beautifully grained and very hard, though nice to work. The fruit is shaped much like an Apple, and also grows in bunches as some Apples do; but if you take one in your hand and press it when ripe the skin will come clean off, and the inside is then found to be beautifully clear jelly-like substance, which when placed in the mouth melts into water. This jelly surrounds a brown stone, of which the natives make a sort of cake, after it has been soaked for some days. The "Papau," or Mummy Apple, has also some curious facts connected with it that are useful to know. The very young Apples when holed make a most delicate substitute for Vegetable Marrow; the stalks and leaves if boiled with clothes will render them beautifully clean and white; they come out of the boiler a bright gamboge yellow, but when hung up to dry in the air they turn perfectly white again; a small piece of the leaf or stalk boiled with an old fowl or tough piece of meat makes it quite tender.

HORTICULTURAL SHOWS.

CROYDON.

THE eighteenth summer Show was held on the 1st inst. in the grounds of Wellesley House, kindly placed at the disposal of the Committee for the

occasion by J. S. Balfour, Esq., M.P. This Show was a great success both as a display and also financially, and extra space had to be provided to accommodate the large number of entries. As a rule the classes were well filled, the extraordinary quantity of Roses testifying to the popularity of the queen of flowers in the Croydon district, and local exhibitors being well to the front. There were no less than 120 feet run of tables occupied by stands and boxes of Roses, besides many detached lots for display and competition. In the open class for Roses, forty-eight blooms, distinct, the first prize went to Cheshunt, Messrs. Paul and Son's lot including extra good blooms of *Senateur Vaisse*, *Marquise de Castellane*, *S. Reynolds Hole*, *Madame Gabriel Luizet*, *Xavier Olibo*, *La Duchesse de Morny*, *La France*, *Merveille de Lyon*, *François Levet*, *Maurice Bernardin*, *Sultan of Zanzibar*, and *Abel Carrière*. The second prize was taken by Mr. W. Rumsey, Waltham Cross, with, amongst others, excellent samples of *Madame Gabriel Luizet*, *Princess Beatrice*, *Heinrich Schultheis* (grand), *Marguerite Brassac*, *Madame Sophy Fropot*, *Julius Finger*, *Edouard Morren*; and the third prize by G. Bunyard & Co., Maidstone, with a very even lot, including most of the above. In the class of twenty-four H.P.'s, Messrs. Paul, Bunyard, and Rumsey stood in the rotation given; whilst for twelve Teas, distinct, Mr. G. W. Piper, Uckfield, stepped into the first place with excellent blooms of *Jean Pernet*, *Madame Bernard*, *Belle Lyonnaise*, *Annie Ollivier*, *Souvenir d'un Ami*, *Catherine Mermet*, and others; Messrs. Bunyard taking second with, amongst others, good blooms of *Jean Ducher*, *Perle des Jardins*, *La Boule d'Or*, *Comte de Paris*, and *Madame Willermoz*. For twelve Roses, one variety, Messrs. Bunyard secured the premier place with splendid blooms of *Lady Mary Fitzwilliam*, a grand light flesh Rose, rather after the style of old *Baroness Rothschild*; Messrs. Paul being second with a good even stand of *A. K. Williams*.

For the National Rose Society's silver medal for the best Rose bloom in the Show exhibited by gardeners or amateurs, a perfect bloom of *Etienne Levet* was selected for the much-coveted honour, in the stand of twenty-four set up by Mr. H. Simmons, gardener to Rev. H. C. Hales, Woodman-court; whilst the Society's bronze medal was gained by Rev. W. Wilks, of Shirley, with a magnificent bloom of *La France*, in each case another bloom of the same variety running the winner very close.

In the open class competition for a group of plants staged for effect, Mr. H. James, Lower Norwood, took the first prize with a fine group of Orchids, including some very rare specimens of *Cattleyas* and *Masdevallias*, *Palms*, *Crotons*, *Dracenas*, &c.; Mr. T. Butcher, South Norwood, whose staging was very neat, running very close for second place, and only wanting in Orchids to have exchanged with Mr. James; Mr. Chaff, Park Hill Nursery, being a good third, but displaying rather too much colour for effect. Mr. James also took the first for six Orchids, which included a rare plant of *Epidendrum vitellinum*, carrying upwards of 100 blooms, a very fine *Aerides odoratum purpurascens*, and an equally good *Odontoglossum cordatum aureum*. The second six Orchids were highly creditable to Mr. Penfold, gardener to Canon Bridges, Beddington House, and included a rare plant of *Vanda tricolor*, extra good for the season, and a fine *Phalenopsis amabilis*; whilst Mr. A. Luff, gardener to R. R. Wyatt, Esq., Streatham, showed for third prize a good *Cypripedium Parishii*, a fair *Cattleya Warneri*, and some others.

The contest for nine stove and greenhouse plants in flower was an easy walk over for Mr. James, and his group had in it a very well-bloomed *Stephanotis* that would be hard to match, and excellent specimens of *Kalanthes coccinea*, *Erica ferruginea*, *Anthurium Schertzerianum*, *Ixora Williamsi*, &c. For the nine foliage plants, Mr. W. King, gardener to P. Crowley, Esq., Waddon House, was a good first with healthy clean specimens of *Crotons*, *Dracenas*, *Asparagus tennissimus* (the latter a grand specimen), *Palms*, &c. Second, with very large specimens, was Mr. Penfold with a fine *Cycas revoluta*, *Pandanus*, *Anthurium crystallinum*, and other well-grown plants; and Mr. James here had to content himself with the third prize, though setting up a really good group, including a grand plant of *Dracena Baptisti*, *Croton Wiesmanni*, and a fine old plant of *Macrozamia Dennisoniana*. In *Dracenas* there was a strong contest amongst district gardeners and amateurs, Mr. W. King being placed first for excellent specimens of *D. Baptisti*, *D. amabilis*, *D. recurva*, *D. vivicans*, and *D. Gladstonei*. T. N. Penfold second with several of the above, only wanting size to quite equal them; and Mr. A. Luff third, his group having *D. Lindeni* and *D. Goldiana*, both very distinct and effective, and all being clean and bright, but rather small.

The collection of twenty-four bunches of cut flowers went to Mr. A. Alderman, gardener to C. Czarnikow, Esq., Mitcham, consisting of fine bunches and trusses of *Gloxinias*, *Orchids*, and other stove and greenhouse blooms. The dinner table was safe in the hands of Mrs. Butcher, South Norwood, who has been very successful this year in cut-flower decorations at first-class shows.

The show of fruit was rather small, but Strawberries, Melons, and Grapes were very commendable for the season, and Mr. A. Alderman staged Black Hamburgs, very neat, shapely, well-coloured bunches that would have held their own in a much stronger competition. His six Royal George Peaches, too, were even, well coloured fruits of excellent quality. Cucumbers were a very strong class, the first prize pair—Mr. Penfold's—being A1. For the collection of vegetables Mr. J. Radbourne, gardener to Baroness Heath, came in well first in a strong class. Mr. J. Laing's special prize for six Tuberous Begonias was also keenly contended for, the first prize going to Mr. Penfold with even well-grown plants in fine bloom, Mr. Brice taking second with a nearly equal half-dozen.

Mr. T. Snibb, gardener to Alderman Cooper, Mayor of Croydon, set up a very handsome group of flowering and ornamental plants for decoration, which the Judges very highly commended. Mr. J. Laing, Forest Hill, also made a very fine display with examples rarely equalled at a local show, his Begonias fully sustaining their world-wide reputation, and were greatly admired. Messrs. Cheal & Sons, Crawley, also sent for decoration a very fine group of herbaceous plants (cut spikes and trusses), and a first-class stand of Roses; Messrs. H. Coppin & Son had a good group of Begonias, &c.; Mr. T. Butcher, a neat group of flowering plants, *Palms*, and *Ferns*; and the Westerham Nursery and Seed Company a choice collection of cut flowers.

The management reflected great credit on Mr. A. C. Roffey, the Secretary, who was ably seconded by an active and very courteous Committee,

who all thoroughly appreciate their work, and do it well. The staging was entrusted to Messrs. J. Fewell, T. Kemsley, W. Neale, H. Pinyon, and G. Belton, and the results showed their high qualifications for that office. The Judges included Messrs. J. Laing; J. Peed, Tulse Hill; Legge, Wimbledon; W. Jordan, Crawley, for the open class. Rev. A. Cheales, and Messrs. Ridout, and J. Brown, Reigate, for cut flowers; and Mr. E. Morley, Mr. W. Rumsey, and Mr. G. W. Piper for gardeners' and amateurs' classes. During the day, which was fine and warm, though not sultry, the ground was thronged and the tents filled with a great and fashionable company, including all the *élite* of the neighbourhood and many strangers. Everything passed off most harmoniously, and the Show was altogether very enjoyable.

TUNBRIDGE WELLS.

ONE of the most extensive and beautiful shows in Kent is that which annually attracts so many exhibitors and visitors to Tunbridge Wells, and which as regards the quality of the contributions is entitled to rank amongst the best provincial shows in the home counties. There is a freshness about all the produce that is most pleasing at midsummer, and each section of classes, plants, flowers, fruit, and vegetables are invariably well represented, so that a most diversified Show is provided. The site chosen is also a very suitable one, and this is a matter of considerable importance in the success of a flower show. The Calverley Hotel grounds are pleasantly situated, and in them the tents were placed that were devoted to the plants, groups, and vegetables, while the large Public Hall contained the fruit, Roses, miscellaneous cut flowers, and floral decorations. In a few classes the competition was not quite so keen as at some previous shows, but this was chiefly notable in the fruit section, except the black Grapes and Peaches.

PLANTS.—Stove and greenhouse plants are always an interesting feature at the Tunbridge Wells Show, and that now being noted was no exception to the rule. The largest prizes are offered in the open class for eight distinct varieties—namely, £8, £6, and £4 as the first, second, and third prizes respectively. First honours were accorded to Mr. A. Gibson, gardener to T. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, who had beautiful fresh neat specimens, not of great size, but compact, healthy, and well flowered. They comprised *Clerodendron Balfourianum*, *Ixora Williamsi*, *Dipladenia regina*, *Dipladenia amabilis*, *Anthurium Schertzerianum*, and *Clerodendron fallax*, with twenty panicles of its brilliant scarlet flowers. This very handsome plant is rarely seen so well shown as at this Exhibition, and it is rather surprising that so effective a plant for the summer exhibitions should be neglected, as it invariably attracts much attention when in good condition, though it would not perhaps possess the same value as a good *Erica*, *Statice*, or other hardwooded plant. Mr. T. Gilbert, Hastings, secured the second place with plants of similar size and freshness, and but few points behind the first. He had *Erica Cavendishiana*, *Clerodendron Balfourianum*, *Aphelexis macrantha rosea*, excellent; *Allamanda grandiflora*, *Dipladenia amabilis*, *Statice profusa*, *Allamanda Hendersoni*, and *Erica Exquisite*. Mr. Rann, Handcross Park Gardens, Crawley, followed, two of his best specimens being *Hedera tulipifera* and *Statice Gilberti*. There was also another open class for four plants, in which there were five competitors, Mr. Gibson being again the most successful, having *Ixora Fraseri* with large trusses, *Dipladenia amabilis*, *Anthurium Schertzerianum*, and *Allamanda Hendersoni*. Mr. Samuel Pope, gardener to J. F. Barran, Esq., Holmewood, Tunbridge Wells, was placed second, his best specimen being *Allamanda Hendersoni* with numerous large and handsome flowers. Mr. Rann's plants were good, but not quite so fresh as the preceding, *Stephanotis floribunda* of globular form and freely flowered. In the local classes Mr. Moorhouse was first with six specimens, staging well-grown plants; Mr. S. Pope also taking first with four specimens in the same section.

Foliage plants were shown by many exhibitors, and in the class for eight specimens there was only one entry—namely, from Mr. Rann, who won the premier prize for magnificent plants in exceedingly healthy condition. They comprised the immense *Cycas revoluta* which has so frequently taken a prominent place at exhibitions; *Croton angustifolius*, about 6 feet high and beautifully coloured; *Beaucarnea recurvata*, *Thrinax elegans*, an enormous *Phoenix tenuis*, and *Croton Prince of Wales* well coloured. Mr. Rann was also first, showing his magnificent plants of *Gleichenia Mendeli*, *Cyathea Smithi*, *Gymnogramma chrysophylla*, *Thyrsopteris elegans*, *Cyathea dealbata*, *Gleichenia rupestris gigantea*, and *G. flabellata*; the large *Gleichenias* from Handcross Park are well known, and seldom are such specimens seen so fresh and healthy as they were at Tunbridge Wells. Mr. S. Pope took the second place, *Dicksonias antarctica* and *squarrosa* with *Leucostegia immersa* being uncommonly good in his collection. Mr. Moorhouse, gardener to J. W. Temple, Esq., Leyswood, Groombridge, was third, *Leucostegia immersa* being one of his best plants. Two admirable collections of hardy Ferns were shown by Mr. H. Scammell, gardener to C. Kilby, Esq., Nevill Park, and Mr. J. Allan, gardener to G. H. Fielding, Esq., Ashurst Park. In the first named the most notable species and varieties were *Struthiopteris germanica*, *Osmunda gracilis*, *Onoclea sensibilis*, *Onychium japonicum*, *Athyrium Filix-foemina Fieldiae*, and *Polystichum angulare proliferum*, all very graceful. Mr. Allan had *Polystichum plumosum*, *Asplenium marinum*, and *Lastrea grandidens* in excellent condition. *Caladiums* were represented by moderate-sized plants, but well selected distinct varieties brightly coloured. Mr. Shoobridge, gardener to W. Edwards, Esq., Fern Bank, Tunbridge Wells, took the lead with *Chantini*, *Houlleti*, *Discolor*, *Whitei*, and *Tricolor*, very beautiful. Mr. J. Allan followed with smaller but neat examples of *Belleymei*, *Beethoven*, and *Rubricaulis*, Mr. Turner being third with *Meyerbeer*, *Herald*, and *Houlleti*. Foliage Begonias were well shown by Messrs. Scammell and Beilby.

The contributions in the smaller classes for *Pelargoniums*, *Begonias*, and *Achimenes* added materially to the beauty of the exhibition, forming a margin near the sides of the tent. The principal prizes were secured by Messrs. Allan, Beilby, Turner, Wilkins, and Shoobridge.

Groups invariably constitute an important feature in the Tunbridge Wells Show, one tent being entirely devoted to them. On this occasion there were six competitors, all of whom had tasteful groups, differing chiefly in the lightness with which the plants were arranged, as in choice of materials and combinations of colours there was little to favour any of them specially. Premier honours were awarded to Mr. G. Fennell, gardener

to Mrs. Cazalet, Tunbridge Wells, for a very pleasing contribution, flowering and foliage plants being well proportioned, the former consisting chiefly of Pelargoniums and Canterbury Bells; while of the latter there were tall Palms for the centre and back, with a foundation of Abutilon marmoratum, Asparagus, and Caladium argyrites, margined with Golden Selaginella, Impatiens Sultani, and Lobelias alternately. This group had a bright and graceful appearance, and was preferable to those with a greater number of flowering plants. Mr. Wilkins was second, also with a pretty group, but containing rather too many plants. Lilies, Alonsoas, and Briza maxima were freely employed with good effect. Mr. Bashford was third, Canterbury Bells, Gloxinias, and Adiantum gracillimum constituting the greater portion of the group. Mr. Aylward was fourth, Mr. Pope fifth, and Mr. Cooke, gardener to T. B. de Crawshay, Esq., Rosefield, Sevenoaks, sixth, the last-named having a very graceful arrangement which in the opinion of many persons deserved a higher position.

A charming group of Ferns not for competition was shown by Mr. F. Webber, Toubridge, and attracted more admiration than all the others. It was in the style which some exhibitors have adopted at Brighton and other towns on the south coast, and like those with which Messrs. Birkenhead have delighted numerous visitors to the Manchester Show. The groundwork was formed of Adiantums and Pterises, with three mounds near the back also formed of Adiantums and Pterises chiefly, with a few Pterises, Platyceriums, and Blechnums in the centre. In the front were two smaller mounds, principally composed of Adiantum gracillimum and A. farleyense, all very healthy and most tastefully arranged. There was a coolness and repose about this group that was most refreshing in contrast with the brighter colours of the other groups.

CUT FLOWERS.—Roses had several classes devoted to them, and the competition was fairly good, though we have seen better blooms staged there. Amongst the amateurs Mr. Alfred Slaughter, Jarvis Villa, Steyning, who secured the premier prizes with twenty-four and twelve Hybrid Perpetuals, and the same position with twelve Teas. Mr. Ridout, gardener to T. B. Haywood, Esq., Reigate, following in each class, Mr. Shoesmith and Mr. Simmons taking the third prizes. In the two open classes bright and handsome blooms were staged, especially in the stand for forty-eight blooms from Mr. Piper, which was, however, very reluctantly disqualified for containing two blooms of Duke of Edinburgh, though the first prize had been awarded to it. Messrs. G. Bunyard & Co., Maidstone, were placed second, and the Judges did not alter the award after the first stand had been disqualified, though the blooms well merited a higher position under the circumstances. Messrs. C. F. Woolard & Son, Cooksbridge, Lewes, were placed third. With twenty-four blooms Mr. A. Slaughter was again victorious, Messrs. Bunyard and Co. following, their stand containing the best Hybrid Perpetual Rose in the open classes (Violette Bouyer), for which the National Rose Society's silver medal was awarded. Three handsome collections of miscellaneous cut flowers were shown by Messrs. J. W. Temple, Johnstone, and Waterman, who secured the prizes in that order, the first stand chiefly containing Orchids. Buttonhole bouquets, hand bouquets, and stands of flowers were strongly represented, Mr. Chard of Clapham Common winning leading honours.

FRUIT.—Black Grapes were excellently shown, and were much the best of the exhibits in the fruit classes. There were six competitors. Mr. Moorhouse deservedly won the leading prize with three handsome bunches, solid, compact, even, and well proportioned, the berries large and superbly coloured. Mr. Hopgood was second with large but looser bunches and larger berries excellently coloured. Mr. Morris, gardener to C. F. Ebdon, Esq., Baldoleo Place, St. Leonards, was third also with large bunches and berries, but not quite so well coloured. White Grapes were of rather indifferent quality. Mr. W. Harvey, gardener to C. L. Huggins, Esq., Whiteleaf House, Warlingham, led with Muscat of Alexandria fairly ripened. Mr. Wilkins was second with Foster's Seedling, and Mr. J. Gore third. Mr. Hopgood was first with a collection of fruit, staging three good Pines, black and white Grapes, Strawberries, Raspberries, Cherries, Melons, Peaches, and Nectarines. They were tastefully arranged on Vine leaves and moss. Mr. Fennell followed, white and black Grapes being his best dishes. Mr. Waterman was third with good examples of Buckland Sweetwater and Black Hamburg Grapes and a Queen Pine. Peaches, Strawberries, and Melons were also well represented, the exhibitors already mentioned taking the leading prizes.

VEGETABLES.—Three handsome collections of vegetables were shown in the open class, and so close were they in merit that it was only after very careful comparison that the Judges could determine their positions. Ultimately Mr. Waterman, gardener to H. A. Brassey, Esq., Preston Hall, Aylesford, was awarded premier honours for most praiseworthy samples of Early Naples Onions, Early London Cauliflowers, Early Nantes Carrots, Culverwell's Telegraph Cucumbers, and Moore's Cream Vegetable Marrows. Mr. J. Gilmour, Seacox Heath, Hawkhurst, was second with a good and well-displayed collection. Mr. W. Johnstone, gardener to the Marchioness Camden, Bayham Abbey, was third.

The weather was very fine, and a large attendance of visitors rendered the Show as successful as could be wished.

SHEPPERTON.

LAST year a Society was formed in Shepperton, and the first Exhibition held about this time proved so satisfactory that it gave the promoters good hopes of a still farther advance another season. These anticipations were fully realised in the Show of last Thursday, and it appears very probable that the Exhibition will steadily increase in importance, and take its place amongst the foremost local shows around London. This year the Committee were especially fortunate in having, through the liberality of their President, Lieut.-Col. W. H. Harfield, the beautiful grounds of Sunbury Court placed at their disposal, and the success of the Show from a horticultural point of view was undoubtedly in a great measure due to this fact. There is much local enthusiasm concerning the Society, and several of the most prominent officers are ardent horticulturists, Major Lendy being especially energetic in his efforts to establish the Society, while Mr. H. Bennett, of "Pedigree Rose" renown, has also rendered important assistance both technically and pecuniarily. The Hon. Treasurer, Mr. E. Rutter, and the Hon. Secretary, Mr. A. E. Stearns, have worked assiduously on the

Society's behalf, and the latter gentleman was indefatigable both before and on the day of the Show. It must have been with much satisfaction that these gentlemen viewed the result of their efforts in the numerous plants, flowers, fruits, and vegetables which were placed in competition for the moderate prizes offered in the majority of the classes. No less than five tents were occupied with the exhibits, one being devoted to plants, another to table decorations, a third to groups, a fourth to vegetables and cottagers' produce, and the fifth to fruit and Roses. All these were arranged to the best advantage by Mr. Bowell of Richmond, who was specially engaged for the purpose, and performed his rather difficult duties with general satisfaction.

After the awards had been made Lieut.-Col. Harfield entertained the Judges, Committee, and friends at luncheon, when, in the course of some short speeches, most cordial wishes were expressed for the Society's continued prosperity.

PLANTS.—One of the leading classes in this department of the Show was that for six Orchids, in which two good collections were staged. Mr. S. West, gardener to Major Lendy, Sunbury House, Sunbury, won the prize with well-grown plants of Cattleya gigas Sanderiana, an extremely handsome variety, bearing eighteen flowers; Odontoglossum vexillarium Cobbianum, twelve spikes; Cattleya Mendeli, Lælia purpurata, and Dendrobium thyrsiformum. Messrs. Jackson & Son, Kingston, also had some healthy freely flowered plants, which were highly commended. Major Lendy was awarded the prize for the best specimen Orchid, Lælia purpurata, with twelve spikes of three to five flowers each, in fine condition. The stove and greenhouse plants were not large, but neat and well grown, especially so in the premier six from Mr. J. Reeves, gardener to W. Hewitt, Esq., Oatlands Park, which comprised Erica Cavendishiana, Statice profusa, Impatiens Sultani, Bougainvillea glabra, and Plumbago capensis. Mr. J. Wakefield, gardener to E. Pettet, Esq., Oatlands Park, was placed second, an excellent Erica ventricosa alba being noticeable amongst his plants. A handsome six foliage plants from Mr. Wakefield gained him the leading prize in that class; his best plants were Chamaerops excelsa, Cycas revoluta, Dicksonia antarctica, and Pandanus Veitchi, all vigorous plants. Some well-flowered Fuchsias were exhibited by Mr. J. Plowman, gardener to C. T. Lawers Smith, Esq., Walton-on-Thames, and brightly coloured Coleuses from Mr. Waite, gardener to the Hon. W. P. Talbot, Esher, and Mr. Batt, gardener to H. W. Cuthbert, Esq., secured those exhibitors the prizes in the order they are named. Half a dozen strong and beautiful Adiantums from Mr. Pratt, gardener to Lieut.-Col. W. H. Harfield, Sunbury Court, deservedly won the premier prize. The species shown were Adiantum cuneatum, A. macrophyllum, A. trapeziforme, and A. farleyense, the last named being represented by two very handsome plants. Mr. A. Frankis, gardener to J. W. Wilson, Esq., was third. Messrs. Waite and Wakefield were the prizetakers for hardy and exotic Ferns. Messrs. Waite and J. Bowdon, gardener to E. Barnett, Esq., Kenton Court, Sunbury, having the best Tree Ferns. Pelargoniums were bright, the double varieties being much the best; Mr. Child, gardener to Mrs. Slade, Claygate, Esher, and Mr. Wakefield securing the prizes, while Messrs. Beunett and Waite were awarded equal prizes for single Zonals. Caladiums and Begonias from Messrs. J. Reeve, S. West, J. Child, and G. Taylor also added to the extent and beauty of the Show.

CUT FLOWERS.—Foremost amongst these were the Roses, and the competition was keen in the two chief classes. There were nine exhibitors of twenty-four H.P. blooms, and Mr. C. Warwick, gardener to J. P. Kitchen, Esq., Manor House, Hampton, won the first honours with very beautiful blooms, of which the following were uncommonly fine—Général Jacqueminot, grand in size and colour, and for which a prize was awarded as the best bloom in the Exhibition; Etienne Levet, Baron de Bonstettin, Dupuy Jamain, Catherine Mermet, Charles Lefebvre, and La France. Mr. W. Davis, gardener to E. Rutter, Esq., Halliford, was placed second, and Mr. J. Wakefield's stand was highly commended. With twelve Roses Mr. Warwick was again first in a class of fifteen competitors, and was followed by Mr. Davis. In other classes the prizetakers were Messrs. West, Goddard, Richardson, and Roper. A class was provided for a collection of twenty-four varieties of cut flowers, in which Major Lendy was awarded the first prize for a most interesting stand of Orchid flowers, comprising the following—Dendrobium suavisimum, densiflorum, and Jamesianum; Cattleyas Eldorado, Schofieldiana, Gaskelliana, Mossiae, and gigas; Odontoglossums vexillarium, cordatum, Schliepperianum, Halli, and Alexandræ; Lycaste Deppei; Cypripediums Hookeri, caudatum, barbatum, Lawrenceianum, and niveum; Oncidium pulvinatum; Vanda tricolor, and Cœlogyne Massangeana. Mr. J. Reeves followed with a good miscellaneous collection.

The competition was keen in the class for table decorations, and every one of the fifteen tables arranged in the tent possessed some points to recommend them, and in several cases they were exceedingly tasteful. This was specially so with the table from Miss Lendy, which deservedly won for that lady the premier honours. It was light and tasteful, but might have been still further improved by employing a smaller quantity of material. It was, however, very beautiful, the principal flowers employed being Delphinium mediceale, Oncidiums, Spireas, Epidendrum vitellinum, and Begonias, with Ferns and Grasses, Brizas being freely employed. The centre of the table was occupied with low stands, surrounding these being small troughs similarly filled. Miss Skrine, Sunbury, was second with a diversified arrangement of Poppies, Brizas, Spirea filipendula, Oxeye Daisies, and the yellow Lotus. Miss Ada Gittens, River Bank, Shepperton, was third with a less bright arrangement of double Feverfew, Grasses, and Adiantum cuneatum. The best of the others were distinguished by combinations of Cornflowers and Poppies, Water Lilies and Forget-me-nots, pink and white Canterbury Bells and Everlasting Peas, and dark and light Roses. This tent was one of the most interesting in the Exhibition, and the Committee would do well to give as much encouragement as possible to what is likely to become an important feature in the Show.

FRUIT AND VEGETABLES.—There was not an extensive display of fruit, but it was of fairly good quality, especially the black Grapes. Mr. Osman, gardener to Lawrence G. Baker, Esq., Ottershaw Park, Chertsey, was first with three good bunches of Black Hamburg, well coloured, and Mr. J. Bowden followed with a black Grape named Gros Colman, but certainly not that variety; it was, however, very well coloured. Mr. Osman was also first with Buckland Sweetwater in the white Grape classes. Mr. C.

Gardner, gardener to R. H. Turner, Esq., Walton, was second with the same variety. Peaches, Nectarines, Melons, and Pine Apples were also shown by Messrs. Bowden, Sutton, Wakefield, Burns, Frankis, Reeves, and Waite. The last-named also had the best collection of vegetables in a class of eight competitors, winning the first place with admirable examples of Telegraph Peas, Cucumbers, Dedham Favourite Tomatoes, Snowball Turnips, White Leviathan Onions, and Snowdrop Potatoes. Mr. J. Child was a close second, and Mr. West's collection was highly commended.

Of the miscellaneous exhibits the most noticeable was a collection of Pedigree Roses from Mr. W. Bennett of Shepperton, and a stand of his new Mrs. John Laing was greatly admired, well deserving the certificate awarded for it, an honour that was repeated at the Crystal Palace a few days after. Her Majesty, Lady Mary Fitzwilliam, and the celebrated Francis W. Bennett were also very handsome. Messrs. Jackson & Son, Kingston, sent a very beautiful group of greenhouse plants, and Messrs. C. Lee & Son, Hammer-smith, had some boxes of Rose blooms.

EALING.—JULY 7TH AND 8TH.

THE twenty-first summer Exhibition of the Ealing, Acton, and Hanwell Horticultural Society was held in the grounds of Gunnersbury Park, Ealing, on July 7th and 8th. The Show was of considerable magnitude, four large marquees having to be erected in order to provide space for the very large number of entries received. Classes were provided for specimen flowering and foliated plants, groups, Roses, and cut flowers, besides fruit and vegetables, and in all of them competitors were numerous. Under these circumstances it is to be regretted that neither time nor space will permit of a detailed report of the exhibits being given. We will, however, briefly glance at the most noticeable of them.

Perhaps the most distinctive feature of the Show was the groups of plants arranged for effect in the open classes for special prizes. These were without exception beautifully arranged. The first-prize group, that of Messrs. W. Fromow & Sons, Sutton Court Nursery, Chiswick, was one of the handsomest we have seen, and was greatly admired. Various Orchids, Lilliums, Gloxinias, Irises, and other plants were employed, and

were awarded first and second prizes respectively. In the corresponding classes for white Grapes, however, Mr. Baird's exhibit was a marked improvement, two very fine bunches of Duke of Buccleuch being shown. They were of good size and splendidly finished, first prize being deservedly awarded. Two excellent dishes of Strawberries were shown by Mr. Gardendroy, gardener to Mr. C. B. Bingley, Stanhope Park, Greenford, the varieties being British Queen and Dr. Hogg. Mr. G. Fulford also showed a splendid dish of James Veitch. The other exhibits of fruit do not call for special comment.

There was plenty of competition in the vegetable classes, though nothing remarkable was exhibited. For Potatoes Messrs. Grainger, gardener to W. Clark, Esq., Ashton House, Ealing; Milson; Holden, gardener to C. T. Amherst, Esq., Castle Bar House, Ealing; Wright, gardener to J. P. Greenfield, Esq., The Spring, Hanwell, and Chadwick were the principal prizetakers. Cucumbers were well shown by Messrs. Weeden, Langden, and Wright. Prizes for Onions, Carrots, and Turnips were also awarded to the last named exhibitors. Competition was keenest, however, in the cottagers' classes, and their exhibits were far more numerous, and, in several cases, quite equal in quality to those in the open classes. The Society wisely offered three, four, and sometimes five small cash prizes in each class, and the result was a much larger number of entries than would have been received had only one or two prizes of greater value been offered.

The exhibits not for competition were unusually numerous, and added so materially to the effect of the Show as to merit special mention. First and foremost must be placed the splendid group of Ferns and fine-foliated plants from Mr. Hudson, gardener to H. J. Atkinson, Esq., Gunnersbury House. Grand specimens of *Gleichenia rupestris*, *Davallia bullata*, and *Asparagus plumosus* were conspicuous amongst smaller yet good plants, and were greatly admired. Messrs. Charles Lee & Son, The Arboretum, Isleworth, were represented by a fine group of hardy ornamental trees in pots, and also by collections of cut and pot Roses; the former contained some of the finest blooms in the Show. Messrs. Veitch & Sons, King's Road, Chelsea, also showed a handsome group of Roses in pots, and a few stands of cut blooms. Mr. B. S. Williams, Victoria and Paradise Nursery,

Fig. 6.—DRUMMOND'S TURF-CUTTING MACHINE.

their effect was not spoiled, as is too frequently the case, by a redundancy of green. Second prize was adjudged to Messrs. Hooper & Co., Covent Garden, who also showed an exceedingly effective group, Lilliums, Gloxinias, single and double Begonias, Carnations, Petunias, and other flowering plants being most effectively interspersed with Ferns, Dracenas, and Crotons. Mrs. Treadaway, Acton, was awarded third prize. Smaller but similarly attractive groups were staged for the Society's prizes. Messrs. Chadwick, gardener to G. M. Nelson, Esq., Hanger Hill House, Ealing; G. Fulford, gardener to J. Boosey, Esq., Hill House, Acton; Smith, gardener to Thos. Nye, Esq., Oakville, Castle Hill, were awarded first, second, and third prizes respectively. Seven groups in all were shown, and minor prizes were awarded to Mr. Davis, gardener to — Luke, Esq., Fairlawn House, Chiswick; and Mr. J. Fulford, gardener to G. Wright, Esq., The Elms, Acton. The same exhibitors were to the fore in the classes for specimen flowering and foliage plants, Messrs. Chadwick and Davis in particular exhibiting many highly creditable specimens, their plants being large and healthy. Classes were also provided for Gloxinias, Begonias, Petunias, Pelargoniums, Fuchsias, &c., the principal prizes going to the exhibitors already named, and Messrs. Weeden, St. John's Nursery, Ealing, and Milson, gardener to W. Tindell, Esq., Manor House, Drayton Green.

Cut Roses were fairly shown. The challenge cup which, according to the conditions, becomes the property of the exhibitor who was placed first on two occasions, finally passed into the possession of H. H. Hayward, Esq., Hill Side, Ealing (gardener, Mr. Langden, who won it last year), good blooms of the most popular varieties being shown. Prizes were also awarded to Messrs. J. A. Morris, Florist, Church Road, Acton; Elliott, gardener to J. Moore, Esq., Melbourne Lodge, Ealing; and others. Mr. Langden, however, secured the lion's share of the prizes.

In addition to the preceding, numerous prizes were offered for bunches of cut flowers, bouquets, epergnes, baskets of flowers and wild flowers; and so great was the response that the exhibits in these classes occupied a considerable portion of space. Lady exhibitors were, as usual in these competitions, by far the most numerous, and many beautiful examples of tasteful arrangement were shown.

The fruit exhibits were not noteworthy for quantity, nor, with one or two exceptions, for quality either. Some very fine bunches of Black Hamburg Grapes were shown by Mr. Milson. The bunches were large, the berries of good size and well ripened. Equally large bunches, but lacking finish, were sent by Mr. Baird, gardener to C. N. Daw, Esq., Homefield, Ealing; they

Upper Holloway, London, N., staged an attractive group of Orchids, and greenhouse and stove plants; while from Messrs. J. Laing & Co., Forest Hill, came a handsome miscellaneous group of plants. Mr. Watkinson, market gardener, Ealing Common, showed some very fine Cauliflowers and Vegetable Marrows.

The Show was admired by a large number of visitors, and Mr. Richard Dean, the Secretary, is to be congratulated on a decided success.

DRUMMOND'S TURF-CUTTING MACHINE.

MR. DRUMMOND requests us to draw the attention of our readers to his new turf-cutting machine. We have not seen it, but cite the following description from the *Invention and Inventors' Mart*:—"The turf-cutting machine invented by Mr. F. T. Drummond, gardener, of Cotton Hall, Bridgenorth, Salop, is very ingeniously contrived and an excellent labour-saving appliance, as it lifts as much turf as ten men would do. The turf is, moreover, cut perfectly true; for we are informed that on a test being made, out of 760 square yards of turf cut, there were only two lumps thrown out as thin ones when the men were relaying. Each turf was cut 2 feet long, 1 foot wide and 1½ inch thick, the whole being lifted in four hours.

"In our engraving, *a* is the draught bar for fixing the gearing to for hauling the machine. The gearing can be put to any height on the bar according to the draught required: *d* is the cutting blade, with vertical sides to cut the width. This works in guides, and can be altered to any required thickness of turf to be cut: *d* are the knives fitted to slide in arms *e*, on drum *n*, to cut the turf in lengths. There are four of them, and the drum being 4 feet in circumference turfs can be cut in 1, 2, or 4-foot lengths. We may state that in practical trials the 2-foot lengths were found to be most serviceable. They are handy to pick up, wheel away and stack, and are of a nice size to relay, the bottom of the turf and

sides being cut as true and smooth as if it had come out of a planing machine. The rolling frame is iron, with wooden rollers working in studded eyes varying in thickness from 2 inches to half an inch. There is a steel blade fixed at the bottom, so that by a jerk of the lever the blade is made to cut through the turf, the onward motion of the machine compelling it to run up the wooden roller, and the large roller causing it quickly to fall from the perpendicular. The lever is released when the turf is large enough, and the frame will run over the rolled turf, when the first motion is again repeated. It will be seen that the machine is a most useful appliance in the laying out of gardens, but this is not its only purpose. The inventor claims that by taking the knives off the drum, and using the appliance in this way, a piece of lawn which has become infested with objectionable growths, such as Daisies, Plantain leaf, rank grasses, Dandelions, &c., can be completely changed for the better, and that it can also be applied to rough pastures, as the machine could be used to destroy rank grasses in such pastures. Further, by substituting a blade with more pitch at *e*, as shown by the engraving, the ground to be levelled for tennis, cricket, &c., grounds, can be broken up in about the same time as it takes to lift the turf, thus obviating the digging, levelling, raking, and rolling by hand. The machine therefore is a very useful appliance, which should form a *sine qua non* of the landscape gardener, and would be useful in every gentleman's garden where turf requires levelling or renovating. It need only be better known to be highly appreciated."

KITCHEN GARDEN.

Staking Asparagus.—The recent warm weather has brought on the Asparagus shoots so quickly that they are now very tall. The growths should be secured to prevent their breaking over by the crown, which is very liable to be the case if left untied until the first storm of wind, which may happen any day.

Salsafy and Scorzenera.—Where these show any signs of blooming prematurely have them drawn up at once, and sow again. Crops which are going on all right should be thinned out to at least 6 inches from plant to plant. Those two vegetables were finer with us last winter than we ever had them. They were growing in what we might term thoroughly good Carrot soil, and as they were thinned in good time they developed without any check.

Mushroom Beds.—These are worse to manage now than they are in early spring or late autumn, as the summer heat brings maggots, and is otherwise troublesome. A cool position under large spreading trees and behind walls are good places for beds now, and very cool sheds or cellars will also do. Where maggots are destroying the crops dissolve a small handful of salt in 4 gallons of tepid water and water the surface thoroughly with this.

Swedish Turnips.—We have had to deal with cooks who would not use these, and we have found others who preferred them to all others in winter. They are very hardy and easily grown, and an excellent winter vegetable. Those who have not tried them might do worse than begin. The present is a good time to sow for a main winter crop. They require rich soil and an open position. The drills should be 2 inches deep, 18 inches apart, the seed sown thinly, and the plants thinned out to 1 foot apart as soon as they can be handled.

Vegetable Marrows.—These are now growing fast. If left alone at this season they soon become a tangled mass of growths, large leaves, and little fruit; but if thinned out systematically, each shoot kept clear of its neighbour, and all grown in the sunshine, sturdy growth and fruits at every joint will be the result. Many promising blooms which open never form fruit, and sometimes we hear complaints of the plants not fruiting at all. In nine cases out of ten this is owing to the crowded state of the shoots and leaves. Those who may have neglected thinning and training until they are reminded of it here need not be surprised if their plants do not begin to fruit on the day or week they are taken in hand, as when neglected at first their after fruiting is never altogether satisfactory, at least for a time. Give those bearing heavy crops abundance of liquid manure. Cut off the fruits before they become too old if a long succession of tender fruits are desired. The same remarks apply to ridge Cucumbers, and great attention should be given to them just now.

Cabbage.—For the autumn supply the seed ought to be sown now. Choose a good position, sowing in shallow drills, and when the plants have made a few leaves by the beginning of August plant them 18 inches apart in good soil after the Potatoes or some other crop.

Seakale.—This has grown unusually well this season. It came into flower in May, and we allowed it to bloom as much as possible that the bees might get the benefit of it, but were it not for this we would not have allowed, the flowers to expand, and those who are not in-

terested in bee-keeping should cut the heads off as soon as they show flower. Ours are out of bloom now, and the seed has been cut off. Fresh crowns are being sent up from the sides, and the main point now is to keep the plants free from dead leaves and weeds.

Late Peas.—The latest crops of all may still be sown, and if the autumn is favourable the produce will be very valuable. Rich deep soil will alone grow them well, and the position cannot be too sunny. Early kinds are sometimes put in now, but we do not like to trust to these altogether, as they are rather tender in late autumn, and often fail when the late sorts are going on all right.

Rhubarb.—Roots intended for early forcing should be kept free from decayed leaves that the crowns may be fully exposed to the sun. Where tender young Rhubarb is wanted in the autumn pull up most of the stalks from a few of the roots, and they will soon break into fresh growth and give a supply of as tender produce as any which could be grown in spring.

Late Beans.—Broad Beans may be put in for the latest crop. They will pod in September and remain good for a considerable time afterwards. Runners will come in very late if sown now in favourable districts, and dwarfs of Osborn's Forcing and the Ne Plus Ultra types may be put in with every certainty of their forming a very acceptable crop. Give them good soil, sow thin, and let their position be an open and sunny one.

FRUIT FORCING.

Figs.—*Early-forced Trees in Pots.*—When the second crop has been gathered fruiting should be discontinued, and the young growths allowed to find their way to the glass, where in the full light they will ripen to the points of the shoots, and set as many Figs as they have leaves; but care must be taken in their management, otherwise they will be too far advanced to stand over the autumn, and the thinning and forcing necessary to their swelling and ripening will weaken the trees and keep them too long to admit of a proper season of rest before they are started in November. Although a third crop is sometimes taken it is at the expense of the succeeding early crop, which is of more consequence as forced fruit is then scarce, and on this account we find it more profitable to take two crops, and gradually inure the trees to full exposure through August and September by increasing the roof ventilation, and withdrawing the lights in hot weather. A liberal supply of water is necessary, and the foliage will need syringing, and most probably sponging, in order to keep it clean and healthy until it shows signs of ripening, when a gradual reduction will be advantageous.

Trees Planted Out.—Similar treatment is necessary in succession houses with regard to stopping and ripening, the points of the shoots being allowed to ascend, but under the extension system of training over a trellis less pinching or stopping is required. Many fruits, especially Figs, are injured by being stopped too late or after the middle of July. When the trees are getting too strong it is better to lift, root-prune, and replant in autumn, than to have a quantity of blind points. When the trained trees have finished the first crop the needful cleansing of the foliage, and liberal thinning of the fruit from which the second crop is to be obtained, must have attention, otherwise the fruit will be small and indifferent in quality. Figs when growing delight in heat and moisture, and require an abundance of light and air when ripening.

PINES.—At this time of year we have advantages in the way of light and heat which should be utilised as much as possible, and artificial heat should be dispensed with or only employed when absolutely necessary. If the temperature in the fruiting house stands at 70° at night fire heat is not needed, while it is quite unnecessary where the young stock is located when the night temperature does not fall below 60°. The chief of the fruit will now be cut from the most advanced section of summer-fruiting plants; therefore, at as early a date as convenient, the suckers should be carefully screwed out, and without delay be potted firmly in good prepared friable loam in properly drained pots of 5 to 7 inches in diameter, after which they should be plunged into a bed having a temperature at 6 inches beneath the surface of 80° to 90° in a pit or house, which can be kept somewhat moist. Shading should be applied over the suckers whenever the sun is powerful, until new roots have formed, and growth is proceeding vigorously, after which little shade will be necessary unless the plants stand near to the glass. The suckers should be watered at the time of potting, but none should be given to them until it is actually needed. Keep the structure damp, and lightly dew the plants twice a day. In other houses the general management will comprise attention to watering, shading, syringing, and ventilating, the latter having prompt attention whenever necessary by opening the house early to dispel damp in the daytime, and by closing early. Water the plants judiciously, examining the surface of the soil in the pots by hand, and supply liquid manure whenever needed abundantly. Plants in small pots should be attended to at least twice a week.

THE FLOWER GARDEN AND PLEASURE GROUND.

Pinks.—There are few more popular flowers than these, and the number of superior varieties are increasing annually. The old white is still a great favourite, but to a certain extent is being replaced by the much larger and more continuous blooming Mrs. Sinkins, and this, again, may yet be superseded by La Belle Blanche, a charming variety, more pure white in colour and quite as free blooming. The present is a good time for striking cuttings—or pipings, as they are termed—of all the sorts, and as young plants will always be found the most profitable a certain quantity should be reared every season. A mild hotbed is the most suitable for the purpose, though in many warm districts it is quite possible to root them in handlights and frames without the assistance of

bottom heat; the cuttings to be from 4 inches to 5 inches long, cut to the fourth or fifth fully developed joint, and dibbled into boxes of loamy sandy soil, about 2 inches apart each way. They should be kept quite close until rooted, unless they give signs of damping, in which case a little air sufficient to dry them should be given every morning. They must also be kept uniformly moist and shaded from sunshine, and when rooted to be given plenty of air, and eventually bedded out where they are to bloom. Seedlings raised in May may now be picked off in boxes of light sandy loamy soil about 3 inches apart each way, and stood in a rather shady position for a time, bedding them out before they become crowded. They will, under this treatment, flower next summer. Seed of the stronger sorts may yet be sown with a fair prospect of some of the seedlings flowering next season. Cover the pans or boxes containing the newly sown seed with squares of glass, and stand them in a shady position till it has germinated, treating the seedlings later on as advised in the case of the earlier-sown seed.

Carnations and Picotees.—The choice border sorts will now be fast unfolding their blooms. They must, if fine blooms are required, be kept carefully staked up and have many of the side buds removed. These are best propagated by layering late in July or early in August. The common border sorts, and which partake more of the character of the perpetual-flowering varieties, can be readily increased by cuttings taken off and otherwise treated as advised in the case of Pinks. If abundance of flower is the principal consideration the stock of plants is best obtained from seed. Seedlings raised in May or early in June form fine plants the same season, and which yield a surprisingly large quantity of bloom the following summer. Many single sorts are usually included in every packet of seed, but these are frequently much admired. Prick out the seedlings either on a bed of fine soil or in boxes, and directly they are strong enough transplant them to their flowering quarters, disposing them 8 or 9 inches apart each way. They succeed best on slightly raised beds, and will be improved by the addition of some road grit and loam, nothing being better than the trimmings obtained from park drives to the ordinary garden soil. The bulk of ours are raised from seed, only the very best of these being perpetuated by cuttings, when these can be had.

Hardy Primulas and Auriculas.—Where these were taken up from the beds and temporarily bedded in, no time should be lost in properly planting them in their summer and early autumn quarters. All may readily be increased, and will be improved by division. A north border or some rather cool position best suits them, a liberal dressing of nearly rotten manure being well mixed with the soil. Every crown that can be split off with a few roots attached will soon grow into a good-sized plant providing they are planted at once and firmly, taking care to keep them supplied with water if necessary, and shaded from sunshine. April is the best month for sowing the seed of this class of plants, including in our case Polyanthus and the commoner Primroses, and the seedlings being pricked out during June or early in July in good light soil they attain to a good flowering size and suitable for transplanting to their flowering quarters in October or November. The seed may also be sown on a cool border as soon as it is ripe, but the seedlings thus obtained will not be of much or any service the following spring.

Spring-flowering Plants.—Many of these will now require attention if a good stock of plants is needed for planting in the flower beds next autumn. A row of handlights stood at the foot of a north wall or other cool position will be found very serviceable for propagating such plants as choice Wallflowers, Alyssums, Iberises, Myosotises, and Sweet Williams, though all of these will sometimes strike freely under a north wall without the assistance of glass, while in many cases strong pieces can be split off with a few roots attached and soon make strong plants. For the cuttings a slightly raised bed should be formed with light sandy soil, the cuttings properly cut to a joint, being dibbled in firmly about 2 inches apart each way and watered. The seedling Wallflowers, Sweet Williams, German Stocks, and Forget-me-nots ought not to be left to take their chance in the seed beds, but should be pricked out on borders of good light soil, from which they will readily transplant if need be. The coolest borders are the most suitable for Daisies and double Primroses, and these should be freely divided, cleaned, and firmly dibbled out.

Pansies may be propagated whenever healthy flowerless young shoots can be procured, and these should be dibbled into boxes and placed in cold frames or into handlights, and kept close and shaded in either case till rooted, the choicest of them to be eventually potted up and wintered in frames. The hedding section or *Violas* that have been flowering all the spring ought when lifted from the beds to be divided and replanted rather deeply in good soil. This induces them to push up abundance of fresh shoots, and these being struck early form strong hardy plants, very superior in every respect to divided old plants. Seedling plants of any sort raised in April or May should, when of good size, be dibbled out in a cool enriched border, and will grow into fine plants for next spring. More seed may be sown in August, and the plants from this sowing will give a good late display next season.

THE BEE-KEEPER.

BEEES AND HIVES FOR BEGINNERS.

I HAVE been prompted to take up the above subject in consequence of the numerous inquiries, which are the best

hives and bees? To answer the first question to meet the approval of everyone is a difficult matter when the numerous kinds are taken into consideration; but, on the other hand, refusal or unwillingness to answer the question direct would betray inability and weakness, so I will fearlessly say that the best hive for all purposes, and taking every requirement into consideration, is the Stewarton of both types, square and octagon.

The first thing a bee-keeper should take into consideration is the site; but as many have no choice in this matter, if the situation is unfavourable artificial means should be used to shelter them from eddy winds. The best means of doing so is to plant a hedge of some sort. Privet grows quickly, but it requires shelter or support, and where ground can be spared a double hedge of evergreens is the best. This not only shelters the hives, but is useful in other ways when manipulating, besides being a safe retreat for timid persons or children. Wooden fences or stone walls make bad protectors against wind. When it strikes either the force is not broken, but rather increased, and falls on the lee side with greater power and comes down like a cascade on all on the supposed sheltered side. To render the apiary more perfect, vegetables, particularly Cabbage, should not be planted near the bees, as they are destructive to those which alight thereon, whereas stirring and working the soil irritates the bees greatly. A single post let firmly into the ground, having a board nailed, or, better, bolted with a bed bolt, the nut let into the post, makes an efficient stand, and is proof against mice. I at one time had metal pillars having a cup filled with water, which the pillar passed through. This kept out all creeping vermin, but these were expensive. The hive placed on this stand will resist any storm if a wire or cord is passed over the hive and fastened to the post. A straw hackle is made on a string reaching only to the upper edge of the hive, the top being covered with hay, and a sheet of corrugated iron projecting over and some distance above the hay, and fastened to T posts, completing the arrangement, and forming the most efficient protection to a hive, that neither cold nor heat will affect, nor will damp show itself anywhere in or about the hive.

Loose straw will sometimes be scattered about, which makes a garden look untidy. Where this is an objection, outside cases or cheap bee houses obviate it, but single-cased hives so protected are far superior to any double-cased ones, and can be moved about from place to place with greater ease and more cheaply than the unwieldy and costly so-called perfect hives, which are in many cases productive of mischief, through dampness engendered therein that is entirely absent at all times in both straw and single-cased wood hives managed in the manner described. To keep a hive free from damp at all times is the first and greatest point towards success in apiculture. Dryness keeps the bees quiet, comfortable, and healthy during winter, encourages breeding and the spreading of brood with more safety than any art or manipulation.

When we make a defence in one place we should be careful not to weaken or neglect another that the enemy may enter. I could mention many weak points in frame hives, but one prominent is the double casing and packing entirely away from the free action of the air so essential to the sanitary and healthful condition of the hive. A thin piece of wood does not retain damp like a thick piece, or rather may I say two thicknesses with the packing, which when damp, is more difficult to dry than a thin piece. Some may argue that this dampness is essential to bees when breeding, and using the enamelled quilt is a proof that this is believed in, but I differ entirely from such an opinion. The drier a hive is kept at all times the more progress the bees will make with the breeding. The foregoing is but an outline of the course I advise bee-keepers to follow. It is the cheapest, most simple and natural, as well as the most rational system that has ever been adopted. Dryness, with a free circulation of air on a hive, with walls little more than half an inch thick, covered 2 inches thick with straw, will brave the coldest winter ever experienced here.

What bees do I approve most of? is the next question. The answer to this is, there are some people through carelessness or too much meddling with their bees fail to succeed with the common bee, now very rare in this country. Others, failing to perceive the qualities and requirements of the Ligurian bee, can make nothing of them, while others, better able to trace cause and effect, have proved them to be in every way superior to our native bee. The Cyprians and Syrians come under the same category, though I must confess these varieties seem tender in our climate during winter, but are otherwise excellent. The Syrians, and perhaps the Cyprians too, seem sensitive in a greater degree to the change of weather than any other variety,

are therefore valuable on this point. The crosses with these varieties with the Carniolian are far the best working bees I ever possessed. If irritated they are vicious, but unless when at the Heather, and then not always, I never use a veil. My bees neither sting me nor anybody else, unless through some provocation. The only protection I use is a little carbolic acid on paper, or a feather, which if carefully applied subdues the most vicious bees instantly. As the season is now at hand bee-keepers will have an opportunity of proving its efficacy in clearing supers of bees before removing them from the hive. I preserve my sheets of saturated paper, so that very little carbolic acid is required to be effective.

The Carniolian bees are not only good workers, flying a long distance for forage, but are, perhaps, the most docile bee in existence. I never knew them make an attack on anyone, and never was stung unless when I inadvertently crushed them. Where there are children or timid ladies, these bees could not fail to give satisfaction. They are also very enduring, and will live and prosper where some varieties would be a failure. I have, therefore, confidence in placing the Carniolian bee as the one that will give the greatest satisfaction with the least disappointment.—A LANARKSHIRE BEE-KEEPER.

KILLING BEES IN AUTUMN.

UNDER the above heading, pages 279, 280 (last volume), your contributor, "A Hallamshire Bee-keeper," says that he was disappointed at my omitting some important advice in my reply to Mr. W. Kruze, on page 221, and then gives his advice as supplementary to what I said. My reason for omitting so important a matter in apiculture was that I had already explained the system he supplements in the numbers for July 31st and August 7th, 1884, which I considered unnecessary to repeat, and which appears to have been unnoticed by your correspondent. His remarks, however, are the more valuable and pleasing by giving his practical results, which corroborates my own experience, and refutes the arguments of those who say that extra large swarms of bees do not gather so much as medium ones will do. Then your correspondent hits the mark, and deserves credit for purchasing bees from bee-keepers in earlier districts when they are no longer of use there, but by the wise action secures a profit to the bee-keeper, with a prospective, and very likely one, to those who purchase the condemned bees. His plan, however, of having 8 lbs. of bees in a light box, with a journey of twenty hours, is open to question; at least there is more risk in driven bees full of honey without combs travelling, therefore they require great care in transmission. If there is nothing but the bare walls of the hive for the bees to support themselves the jarring they are likely to get causes them to become heated and die. May I suggest, to prevent the disaster, for him to fit his boxes with thin boards about two-thirds down from the top of the box, so that the bees will be divided and get sufficient foothold, so that they will not be affected by any rough or undue handling or jarring? The essential ventilation above and below must on no account be overlooked. Another important matter is that in such cases it is absolutely necessary they should travel by passenger train; and as each package is charged separately, a considerable saving would be effected if a number were lashed together or packed into a crate. As your correspondent may have provision made to avert likely disaster, still the foregoing remarks may be found useful to others who may follow your correspondent's commendable plan of saving condemned bees.—LANARKSHIRE BEE-KEEPER.

TRADE CATALOGUE RECEIVED.

E. H. Krelage & Son, Haarlem.—*Wholesale Catalogue of Bulbs and other Plants.*

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (Miss Moorewood).—"The Greenhouse Mammal" is at present out of print, and if the name and address of your friend he sent to the publisher the order shall be traced if possible and the stamps returned.

Marechal Niel Rose Blooms.—A correspondent has sent us two very fine blooms of this Rose, but his letter appears to have gone astray. We shall be glad if he will write to us again, stating the conditions under which the plant is grown that produces such handsome flowers.

Allamanda Leaves Curled (B. C.).—The species, *A. grandiflora*, is naturally more delicate than the larger forms, and more liable to be scorched by the sun. In the case of your plant the moisture is extracted from the shoots faster than it is supplied by the roots, and this break in the supply naturally causes the collapse of the foliage. Whether the root-action is defective by unsuitable soil, or whether there has been a little mistake in watering we cannot tell; but by some cause or other the growths do not receive adequate support; and it will be better to shade slightly till the root-action is better than to allow the growths to be injured like those before us.

Disbudding Chrysanthemums (Cambridge).—We have consulted one of the best growers on the subject of your letter, and he thinks you have not gone far wrong in the treatment of your Chrysanthemums. He advises leaving only 1 and 4 in your diagram, as No. 2 is invariably the weakest shoot. He would take that off entirely. At the end of July Nos. 1 and 4 will be showing each a flower bud again, which should be removed promptly, allowing two side shoots on each growth to extend for flowering. Four flowering shoots are sufficient to leave, and there is always a chance of one being damaged or going blind. If the plants are not very robust, he would only leave one shoot this time, but leave two or three at the next pinching, and be satisfied with that number of flowers.

Carbonate of Soda as a Manure (J. M.).—In reply to your inquiry as to whether this is of "any value" as a manure we reply in the affirmative, but we do not know that its exact value has been tested on any extensive scale. The fertile fields of Syria and some of the most profusely luxuriant fields of the Orientalists abound in carbonate of soda. This alkali enters into the composition of many vegetables and is calculated to accelerate the growth of most crops. It has been used as a liquid manure with advantage to Strawberries, a pound of the soda being dissolved in fourteen gallons of water. Mixed with bone dust or guano it could scarcely fail to be serviceable to the majority of crops. You may safely try it and thus ascertain how far it is beneficial to the soil in your garden. Your Fern is, we think, *Polystichum Lonchitis*, the Holly Fern.

Fungus on Tomatoes (W. S. T.).—Your plants, judging by the portions sent, appear as if they had been too generously treated. Either the soil is very rich, or liquid manure has been given so freely that the leaves seem to be unable to elaborate the sap, and a fungus has taken possession of them similar to that which attacks Potatoes. We should feed the plants less, supporting them chiefly with pure water and an occasional top-dressing if needed of fresh soil or some such phosphatic manure such as superphosphate of lime. We should also apply sulphur to the leaves. A simple method is to dissolve an ounce or two of soft soap in a gallon of water, adding sulphur to form a kind of cream that will pass through a syringe; or it may be dusted on the parts affected. Maintain a buoyant atmosphere, never wholly closing the house at night, and increase the ventilation very early in the morning.

Gall-mites on Trees (G. M. Dougall).—It has been discovered that the Alder is infested by at least four species of the gall-mite tribe. The first you describe, showing itself by silvery patches, usually beneath the leaf, is, we presume, *Erineum Alneum*. The second scatters thickly over the leaves galls of green or yellow tints: this is *Cephaloneon pustulatum*. By the third galls are produced along the nervures, the upper showing most traces, this would be *Phytoptus Alni*, a less frequent kind. Upon the Plane or Sycamore the first gall described is very common, it is the work of *Phytoptus Aceris*, similar to that produced by its congeners that haunt the Lime and the Maple. We should attribute the second kind to a species of *Erineum*, possibly as yet unrecognised by naturalists. To *Phytoptus Pruni* must be attributed the raised galls on the Plum, sometimes like purses or clubs in miniature. Continental observers describe another gall-mite of the Plum, which infests the twigs of young trees, and even occasions their death in some instances. As to *Chermes Abietis*, we do not think the specimens you mention are males, but rather immature females. The males are invariably winged; of their partners there are both winged and wingless forms, appearing at different seasons.

Pruning Junipers—Clipping Yews—Cutting Down Old Holly (Sussex).—Junipers will bear clipping, but not to such an extent as Yews, as they do not break from the old wood, or very tardily. It is best to only cut back irregularities during moist weather in April, confining the pruning to the removal of those parts detracting from the symmetry of the specimen. Yews should be cut or clipped in August, as they have then made the growth for the season, consequently they keep the form then given through the autumn and winter. If they require much cutting-in it should be done during moist weather in April, which will cause them to break freely even from the old wood, and any irregularities may be removed early in September, as the growth from cutting back will be later. The present is not an inappropriate time for cutting down an old Holly, but it would have been better performed in April or May. We have, however, cut Hollies very hard in even as late as the middle of July, and giving them some good soakings with water and liquid manure alternately, preceding and after cutting in they have made good growths, and in a year or two were converted from ungainly into symmetrical specimens, than which there are none finer for lawns, both the green and variegated kinds being highly ornamental.

Exhausted Peach Trees (A. B. T. T.).—Judging by the examples sent, your trees are in a very enfeebled state indeed. Either the border is exhausted or sour, or what amounts to the same thing, the root-action is defective. The trees are certainly not receiving anything like the support that is requisite for supporting the crop and at the same time producing satisfactory growths. Only a very light crop of fruit should be permitted to remain on the trees. One fruit to every 18 square inches will be ample, and

we should take off all the rest at once. If left they will be of little if any value, and will exhaust the trees needlessly. If the border is at all dry, not on the surface merely, but 2 feet below it, give liquid manure copiously. This will support the trees for a time; but they require fresh soil. The old border should be removed, good drainage provided, and the trees planted in good loam. They will never be satisfactory until fresh roots form in a better medium. If the trees were ours we should lift one at a time immediately the crop was gathered, but it would be requisite to keep both roots and leaves constantly moist during the operation, and afterwards to shade and syringe sufficiently to keep the leaves fresh; new roots would then form before winter, and the growth of the trees would be very different next spring. If you have not the means and skill at your command for removing the trees in summer, let them remain till the autumn, as summer-lifting cannot safely be entrusted to persons who have not had experience in the work.

Market Measures.—The following are usually employed for fruit and vegetables:—These, being often made either of osier or deal shavings, they vary triflingly in size more than measures made of less flexible materials. **Seakale Punnets.**—8 inches diameter at the top, and $7\frac{1}{2}$ inches at the bottom, and 2 inches deep. **Radish Punnets.**—8 inches diameter and 1 inch deep, if to hold six hands; or 9 inches by 1 inch for twelve bands. **Mushroom Punnets.**—7 inches by 1 inch. **Salading Punnets.**—5 inches by 2 inches. **Half Sieve.**—Contains $3\frac{1}{2}$ imperial gallons. It averages $12\frac{1}{2}$ inches in diameter and 6 inches in depth. **Sieve.**—Contains 7 imperial gallons. Diameter 15 inches, depth 8 inches. A sieve of Peas is equal to 1 bushel; a sieve of Currants 20 quarts. **Bushel Sieve.**— $10\frac{1}{2}$ imperial gallons. Diameter at top $17\frac{1}{2}$ inches, at bottom 17 inches; depth $11\frac{1}{4}$ inches. **Bushel Basket.**—Ought, when heaped, to contain an imperial bushel. Diameter at bottom 10 inches, at top $14\frac{1}{2}$ inches; depth 17 inches. **Walnuts, Nuts, Apples, and Potatoes** are sold by this measure. A bushel of the last-named cleansed weights 56 lbs, but 4 lbs. additional are allowed if they are not washed. A junk contains two-thirds of a bushel. **Pottle.**—Is a long tapering basket that holds rather over a pint and a half. A pottle of Strawberries should hold half a gallon, but never holds more than 1 quart; a pottle of Mushrooms should weigh 1 lb. **Hand.**—Applies to a bunch of Radishes, which contains from twelve to thirty, or more, according to the season. **Bundle.**—Contains six to twenty heads of Broccoli, Celery, &c.; Seakale twelve to eighteen heads; Rhubarb twenty to thirty stems, according to size; and of Asparagus from 100 to 125. **Bunch.**—Is applied of herbs, &c., and varies much in size, according to the season. A bunch of Turnips is twenty to twenty-five; of Carrots thirty-six to forty; of Greens as many as can be tied together by the roots. Grapes are put up in 2 lbs. and 4 lbs. punnets; new Potatoes by the London growers in 2 lbs. punnets. Apples and Pears are put up in bushels, sieves, or half sieves. A hundredweight of Kentish Filberts is 104 lbs. Weights are always 16 ozs. to the pound.

Carnations, Picotees, and Pinks (W. G. A.).—The broadly distinguishing marks between these are these Pinks are altogether smaller both in flowers and foliage, and they also bloom earlier than either of the others, and the colour round the petals has an outer ring of white. The following are the characteristics of a good Pink:—The flower must be fully double; so much so, that it should form the half of a ball, rising up to the centre, and should be perfectly circular in outline. Each petal should be stout, broad, and smooth at the edges. This smoothness is called rose-edged; that is, without any notches or teeth. The lowest tier of petals should be the widest, reaching in diameter at least from 2 to $2\frac{1}{2}$ inches. The next row should be shorter, so much so as to show the lacing fully on the lower petals; and the next shorter again, and so on up to the centre, which should be well filled up without confusion. The ground colour should be pure white. The lacing, or circular stripe, should leave an edge of white outside of it, and another inside; this lacing of colour should be of the same width as the outside edging of white, and should be smooth and even at the edges; in fact, laid on as if it had been traced by a skilful hand with a fine camel-hair pencil. Then, at the bottom of the petals, there should be another body of colour, the same as the lacing, to form a hold, rich eye. The Carnation has the marks on its petals from the centre to the edge, and through the edge in flakes, or stripes of colour. The Picotee has its coloured mark only on the outer edge of its petals. Properties of a good Carnation.—Carnations are divided into five classes, namely:—1, Scarlet Bizarres. 2, Pink or Crimson Bizarres. 3, Scarlet Flakes. 4, Rose Flakes. 5, Purple Flakes. *Bizarre* is a French word, meaning odd or irregular; the flowers in these classes have three colours, which are irregularly placed on each petal. Scarlet Bizarres have that colour predominating over the purple or crimson, but the pink or crimson Bizarres have more of these colours than the scarlet. Scarlet Flakes are simple white grounds, with distinct stripes or ribbons of scarlet. Rose and purple Flakes have these two colours upon a white ground. The properties in other respects are—1, The flower should be not less than $2\frac{1}{2}$ inches across. 2, The guard or lower petals, not less than six in number, must be broad, thick, and smooth on the outside, free from notch or serrature on the edge, and lapping over each other sufficiently to form a circular Rose-like flower; the more perfectly round the outline the better. 3, Each layer of petals should be smaller than the layer immediately under it; there should not be less than five or six layers of petals laid regularly, and the flower should so rise in the centre as to form half a ball. 4, The petals should be stiff, free from notches, and slightly cupped. 5, The ground should be pure white, without specks of colour. 6, The stripes of colour should be clear and distinct, not running into one another, nor confused, but dense, smooth at the edges of the stripes, and well defined. 7, The colours must be bright and clear, whatever they may be; if there be two colours, the darker one cannot be too dark, or form too strong a contrast with the lighter. With scarlet, the perfection would be black; with pink there cannot be too deep a crimson; with lilac, or light purple, the second colour cannot be too dark a purple. 8, If the colours run into the white and tinge it, or the white is not pure, the fault is very great, and pouncy spots or specks are highly objectionable. 9, The pod of the bloom should be long and large, to enable the flower to bloom without hursting it; but this is rare; they generally require to be tied about half way, and the upper part of the calyx opened down to the tie of each division; yet there are some which scarcely require any assistance, and this is a very estimable quality. 10, Decided superiority of perfume should obtain the prize when

competing flowers are in other respects of balanced merit. Properties of a good Picotee.—Picotees are divided into seven classes. 1, Red, heavy-edged. 2, Red, light-edged. 3, Rose, heavy-edged. 4, Rose, light-edged. 5, Purple, heavy-edged. 6, Purple, light-edged. 7, Yellow grounds, without any distinction as to the breadth of the edge colour. The characteristics of good form are the same as for the Carnation, but with regard to colour—1, It should be clear, distinct, confined exclusively to the edge of the petals, of equal breadth and uniform colour on each, and not running down (called sometimes feathering or barring), neither should the white ground run through the coloured border to the edge of any one of the petals. 2, The ground must be pure white, without the slightest spot. This rule renders the name, still retained by florists, inappropriate, for *Picotee* is the French for spotted. Cloves are self-coloured; Carnations so named because of their peculiar fragrance.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should contain spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once. (*A Reader*).—You employed not the slightest packing to keep the flowers and Ferns fresh, not even a green leaf; and you have no idea of their withered condition on arrival. It is impossible to name the Ferns without better and fresh fronds. The Orchises all appear to be varietal forms of *O. maculata*, but no one can tell with certainty from such shrivelled examples. (*T. W. S.*).—*Maclea punctata*.

COVENT GARDEN MARKET.—JULY 8TH.

LITTLE or no alteration to quote. Market well supplied, with a fair business doing. Bush fruit putting in an appearance, with promise of good supply.

A WALK ROUND THE FARM.

EARLY in June before haymaking began, when every field and meadow had some special attraction—for farm crops are then seen in all the freshness and vigour of early summer growth, free from spot or blemish, except it be stunted growth or poverty of condition—we walked round the home farm to inspect the crops closely, and to see if results so far proved our culture to be sound or otherwise, so that success or failure might serve to render our future efforts and plans more certain. In point of fact, we wished to learn the truth, or as much of it as we could, about our work, for that is the end and aim of all earnest thoughtful inquiry, and it is our intention to tell something of our inspection and its lessons, in proof that we practise as well as preach.

We first came to a field of Winter Oats in superlative condition, the sturdy vigorous growth showing by its deep green hue and its fine bold heads of corn how rich in fertility the soil is, and be it remembered that the fertility was imparted to it by the use of artificial manures as prescribed by Professor Jamieson, half dressings being given in autumn and spring, consisting of steamed bone flour, nitrate of soda, nitrate of potash, and mineral superphosphate, procured

separately and mixed at the farm in the proportions repeatedly given, and which will again be set forth in full detail at the proper season. Three years ago this field was a mere waste of coarse herbage, rushes, and Heather; it now has its third crop of Oats, each crop showing clearly the steady progressive improvement of the land. The lessons evolved by practice here have been clear and unmistakeable. Taken in detail from the beginning they teach us—not to retain an old foul pasture; not to plough in turf, but to pare and burn it, and plough in the ashes, and so destroy the larva of insects, the roots of perennial weeds as well as seeds; to apply a moderate quantity of nitrates in autumn as well as in spring to land sown early with winter corn; to sow corn for several consecutive years on the same land with the confident expectation of an abundant crop if we are careful also to use a sufficient dressing of genuine artificial manures with every crop, and always to sow Winter Oats in preference to Spring Oats upon land of a light or medium staple if it can be had in September or early in October.

In the next field Winter Tares were a fall crop sufficiently forward to follow the Trifolium in good time from the October sowing. Square-head Wheat alongside the Tares just bursting into ear gave ample promise of at least sustaining our average yield of a little over 5 quarters an acre; but then it must be stated that this Wheat had the autumn and spring dressings of pure artificial manures, and we could not help wishing that some of the opponents of Professor Jamieson's teaching could see corn treated by his prescriptions. In contrast to such satisfactory results we may mention a large field of Barley upon one of our Suffolk farms, dressed with a dealer's "special" manure before it came into our hands, which even now is one of the worst pieces of Barley upon any of our farms. Can vendors of specially adulterated—we beg pardon, "mixed"—artificial manures wonder if farmers turn away from them in disgust, and vow they will have no more of the vile trash? Field Potatoes came next, and the "earthing" was then being done by a man and boy with a horse and double-breasted plough. The growth of all the sorts was satisfactory, as, indeed, it ought to be, for the land was ploughed in the autumn, cross-harrowed in spring, thirty loads of farmyard manure per acre ploughed in, followed by harrows again. The drills were then made with a double-breasted plough, dressed with pure artificial manure, the Potatoes planted, and covered so that the artificial manure was well blended with the soil into which the roots must first spread, and thus a free strong growth was ensured from the first. A frequent use of the horse and hand hoes had kept weeds under, and with the final "earthing" the process of cultivation was complete. A piece of land next the Potatoes was dressed with artificial manure at the same time for Spring Oats, our intention being to try the effect of liberal treatment in this direction for the sake of comparison with the Winter Oats. Nothing, certainly, could be more satisfactory than the appearance of the Spring Oats, only they will be a month later in ripening for harvest, and the fickle weather in spring time that so often retards the sowing of this crop must not be forgotten.

Again did we see the advantage of sowing Mangold early in April; the seed-germination was quick, and the plant-growth, though somewhat checked by late frosts, has been so vigorous that thinning was done, and horse and hand hoeing had kept down weeds, so that this important work was well out of hand before the haymaking was begun. We are always anxious to get the thinning of all the root crops done that is possible before haymaking, for that is such a critical and important undertaking that it frequently absorbs all available labour on the farm. Carrots for cows and horses in winter, Trifolium, Spring Tares, and meadow Grass for hay were chief among the other crops through which we walked. The Spring Tares, if not wanted for folding, will be ploughed in as a valuable manure, and this will probably be done as grass is so abundant. Trifolium is good gene-

rally this year, and we are glad to find its culture is so general; no crop is of more easy culture, and it is unquestionably most profitable. We have made a considerable quantity of it into hay, which will eventually be chopped and mixed with other food for the horses.

WORK ON THE HOME FARM.

Haymaking continues to be the chief work just now, and we must again call attention to the importance of wind rows, or narrow rows of hay made with small hand rakes, by means of which the hay is not only drawn into little ridges through which the air passes freely, but the numerous locks of grass passed over by the tedding machine are moved and drawn up to the tops of the ridges, and much violent heating prevented in the rick subsequently. By all means use horse rakes and hand drag rakes, but also have plenty of small hand rakes at hand for this special purpose. We hear frequent complaints of blindness in Beans, in some instances so much of it that the plants have been chopped up for silage. Swedes already have a rough leaf or two, and will soon be safe from insects. Peas are podding well, and will be a good average crop. Charlock is so prevalent that pulling or hoeing it could not be done. Wherever it stands well above the corn the heads of bloom have been cut off so as to reduce the seeding as much as possible. If only the few plants of this pest which first appear in a field hitherto free from it were destroyed, it never could have spread throughout the country as it has. Charlocks, Thistles, Docks, Nettles, Rushes, and Couch Grass must have no quarter, and it is only by incessant effort and perseverance that they are to be kept down. Hayricks will be thatched as soon as they have settled slightly. It is well to have this well done, and to have plenty of spars pinned securely near the edges of the thatch to prevent high storms from blowing it off. Neatness is desirable in this work, a well-kept rick-yard being an attractive as it is an important feature on the farm. In these days of portable threshing machines it is desirable to build as many cornricks as possible in the fields as a saving of the labour of carting from a distance during the busy season of harvest, due care being taken to select accessible places near a gate and road. Anything tending to reduce both horse and manual labour is worthy of our best attention. As the cattle yards are cleared of manure let them be examined; any faulty drains set right; gates, enclosures, lodges, and cribs put into thorough repair; all new work tarred or painted. We prefer tar, and have used much of it lately whenever men could be spared to re-tar every fence, gate, or building requiring it. We can buy gas tar at 3d. per gallon, and know nothing so cheap or better suited to its purpose. The interior of lodges and cow houses should be washed with hot lime, and rendered thoroughly sweet and wholesome. Greater attention to this matter would tend materially to check the spread of any infectious diseases.

OUR LETTER BOX.

Scouring Calf (*Steward and Gardener*).—A calf so much reduced by scouring as to be almost a skeleton and unable to rise should be destroyed and an end put to its misery and suffering, for such a case is hopeless. From the extraordinary remedy suggested by your cow leech, we should hardly consider him qualified to attend to the diseases of animals. Generally speaking, scouring is caused by foul water; coarse, indigestible, unwholesome food; by long fasting and subsequent gorging, and by exposure to damp and cold. Our highest veterinary treatment consists in judicious feeding, nutritive food, restricted water supply, laudanum and ether or chlorodyne to abate spasm and pain; iron, acids, and bitters to promote the healthy tone of the weakened membrane, and comfortable protection from wind and weather. Such general advice falls clearly within our province. Specific remedies can hardly be stated without actual examination of an affected animal, and therefore we say, Do your best for other animals with food and shelter, and in every case of illness where simple remedies fail, at once call in a duly qualified veterinary surgeon.

REMARKS.

28th.—Fine, bright, and warm, but clouded over in evening.

29th.—Dull morning; fine bright afternoon.

30th.—Fine and bright.

1st.—Fine, but rather oppressive.

2nd.—Haze or fog in morning; moderately bright at noon; darker afterwards.

3rd.—Fine and bright, but rather oppressive.

4th.—Fine and warm.

A rainless week, but temperature rather below the average until the last two days.

—G. J. SIMONS.

PEACH FAILURES.

AFTER a season so hot and dry as 1884, ripening the wood, a good Peach crop was expected this year. From my own observation and the accounts reaching me from other localities the crop is by no means prodigious, indeed both indoors and outdoors it is in some gardens a failure. One correspondent states he has grown Peaches for over twenty years and not had a failure in his early houses until this season, and as this has occurred in two houses of over 60 feet each the loss is considerable. Another correspondent states there is a great promise of fruit this year of all kinds except Peaches, which are a failure even under glass, and several others write similarly, so that there is a remarkable coincidence of facts with my own experience.

The wood of Peaches and Nectarines was very firm in the autumn of last year, but I noticed the buds that give fruit were neither so numerous nor so prominent as they are often seen after a less hot and dry season. In spring the bloom buds swelled tardily, the blossoms expanded weakly; and though they were better under glass than against walls, I noticed particularly that the bees did not visit the flowers. Although making comments unfavourable to the setting of the fruit, I was only laughed at for my seemingly unjustifiable prognostications. The bees had not found them out, and they did not, neither would they, have anything to do with the flowers of the trees against walls. Why did the bees visit the Apricot blossoms and almost entirely neglect those of the Peach and Nectarine? Mark also the difference. Apricots have a crop of fruit, Peaches and Nectarines have not. Clearly the blossoms contained no nectar, and unless this be present will the bees come for pollen alone? I fancy not. Peameal has a powerful aroma sufficiently attractive, and so have flowers if there be nectar.

Whilst on this subject I may mention that the bees were very busy on Pear blossoms much more than on Plums. The former are a full crop; indeed it is a Pear year, but Plums are only thin, except on a north aspect. Apples, again, were only moderately visited, and though the crop may be good it is not equal to the promise as indicated by the blossom. Cherry blossom was also much in request by bees, and the crop is full. Similar remarks apply to Gooseberries—plenty of blossom, the merry hum of bees, and heavy crops of fruit. I might go further. Suffice it to note that though Crocuses bloomed splendidly they were almost neglected by the bees, and they have not a pod of seed where there were a hundred last year. Hyacinths, on the other hand, were very much worked by the bees, and the seeds—we have mostly single varieties—were abundant. Now I make the deduction that the blossoms of the Peach and Nectarine were not perfect; they wanted nectar, and this nectar attracts insects, which liberate the pollen if not brushing it directly on the pistils. I go further, and state that if this nectar be absent and no insects visit the blossom the fruit will not set even if artificial impregnation be practised, as was the case with the Peaches

under glass. This is not an isolated instance, as I have noticed it on former occasions, not only with Peaches, but also with Strawberries in pots, and even with Grapes, the glutinous matter on the stigmas of the latter not being a sign of imperfect organisation, though it may be an obstacle to fertilisation unless removed by some natural or artificial agent, the act of removal being the means by which impregnation is effected. If, on the other hand, the glutinous matter be absent, as it not unfrequently is in Sweetwater, Buckland Sweetwater, Muscat Hamburg (Black Muscat), and other Grapes when forced early, no pollen or any amount of attempted impregnation will cause the berries to set. I therefore conclude that the nectar is an important secretion essential to the support of the ovules and necessary to fertilisation. I suppose the nectar to be a consequence of the elaboration of the sap in the petals, and that these are quite as important to the flower as the leaves are to the tree—develop according to their formation in embryo. We must trace the cause anterior to the blossoming—viz., fruit buds imperfectly developed in embryo, or to unfavourable climatic conditions at the time of flowering. This last will not hold good, as the result is the same under artificial and therefore genial atmospheric conditions as with trees exposed to the weather outdoors.

If we may not attribute the non-setting to the weather, and we certainly had no frost of consequence, we are obliged to accept the fact of the cause being in the immature development of the buds, and in some essential not being present in sufficient quantity to effect their perfect maturation in the preceding season. This I consider is a clear case of premature ripening of the wood, a condition well known to all forcers of early Peaches, and some varieties exhibit this tendency in a more highly marked degree than others. For instance, varieties with large flowers, such as Early York, Grosse Mignonne, and Noblesse, are much subject to premature bud development, and to casting their buds when they should be swelling, whilst the small-flowered varieties, such as Royal George, are not so liable either to premature bud-development or to casting the buds.

More failures in Peach-cultivation are due to drought than to anything else. We form well-drained borders, and if we have ceased to form them rich, we make them so by surface-dressings and matter in liquid form, which in an ordinary season may be all very well, but in a season like the last the moisture was not proportionate to the greater evaporation. A large surface of Peach foliage exposed to the sun parts with an immense quantity of water, and it has to be abstracted from the soil; therefore the water supply must be proportionate to the evaporation. Want of water is the greatest drawback to successful practice, and it is the one thing most needed, or has been neglected when Peach trees cast their buds. It is no use soaking the border when the house is closed, if the trees have been allowed to become dry after the cessation of growth—it will only bring the buds off in a shower. It is folly to give water in lessened quantity when the fruit is ripening, under the assumption that dryness improves flavour, for it is not cutting short the supplies, but the increased evaporation which a circulation of warm dry air provokes, that imparts flavour, and to keep the soil dry after the crop is cleared, or even when the foliage is maturing, is to prevent the perfect development of the buds, and ensure their developing into imperfect blossoms. An insufficient supply of water is not only a source of danger to the crop—once only may imperil it—and to keep the roots dry or allow them to get dry after the crop is cleared, jeopardises if it does not prove fatal to the future one.

In the case of trees against walls there is a similarity of circumstances. If the season be hot and dry, the soil, from the increased evaporation, becomes dry as dust, and the supplies are not given in proportion; indeed the watering and mulching of fruit borders is much neglected in gardens, sometimes because the water supply is inadequate to the increased

demands of a dry season, though there are cases where there is no excuse but want of observation. Walls are very good, but the soil near them becomes very much drier than it does in the open, as is evidenced by vegetable crops on the border, the growth being much weaker next the wall than it is away from it—the degree of vigour being in proportion from the wall outwards. This only holds good in summer, for in winter the warmth does much, and the moisture is then sufficient for the moderate evaporation going on, whilst in summer the reverse takes place—the evaporation is great and the supply of moisture inadequate. This dryness I consider the cause of the failure of Peach trees after a dry, hot season; indeed, many fruit trees fail to fruit satisfactorily against walls from the circumstance of the soil being dry, the roots run into the soil at a distance from it, and these are deep and fibreless through the frequent stirring of the top spit for the growth of vegetables. The trees may have the benefit of the wall—warmth the roots have not—they have moisture when they need it least, and when wanted most it is drawn from a cold substratum, for which reason alone I conclude cordon trees afford finer fruit than trees with the roots as distant from the stem as the branches extend. The cordons have the roots near the wall, the triennial lifting keeping them there in a medium as congenial as the wall itself is to the trees, and, most important of all, they are well supported during the season of growth, being supplied with water passing through a mulching of rich material, which keeps the roots active near the surface, and transmits support during the best part of the year, when trees left to themselves are languishing, and it is this superiority of cultivation which gives the excellence to fruit on trees trained on the cordon or other dwarfing system.

Then insufficient supplies of water at the roots of fruit trees, especially stone fruit, is a great incentive of red spider, and this pest causing the premature casting of the foliage is a source of imperfect bud-formation, and must be taken into full account in securing a crop of fruit. Clean healthy growth from first to last is essential in the perfection of the present and providing for future crops.

Although insufficient supplies of water or nutriment are provocative of imperfect bud-formation failures sometimes occur through the opposite cause. The borders may be rich and deep, the growth is strong and long-jointed, and the buds formed, if not imperfect, are immature, and though they may expand splendidly and set well it is rarely that the fruit passes the first swelling without being cast, certainly very little of it will pass the stoning satisfactorily. The evil is often aggravated by allowing the trees to have the wood so close as to prevent the free access of light and air, so that the growth is not solidified as made, nor does it ripen well—gumming results, the trees becoming unhealthy and unfruitful. The remedy for this latter state of the trees is lifting, a firmer condition of the soil, and the addition of calcareous matter, allowing greater space for the foliage—i.e., keeping the wood thin, and the growth regulated so as to insure an equalisation of the sap, consequently of vigour throughout the trees.

Peach trees differ in varying soils and climates. In some soils the need for lifting is frequent, which particularly applies to shallow and porous soils, as these need more enrichment than soils of a closer texture, and in consequence the roots meeting with but little resistance are straight with but few ramifications or fibres, and they transmit sap much quicker than those in a tenacious soil, and the wood is soft, long-jointed, badly solidified, and imperfectly matured, therefore the need of lifting to keep the roots at home and to increase their ramifications, which is also increased by well firming the soil.

On the other hand Peach trees in heavy soil—loam of a tenacious nature, yet containing sufficient grit to render it friable for the passage of water; and when of a calcareous nature or its equivalent, as is exhibited in some loams not of a calcareous character as that overlying the freestone formation of the West Riding of York or the red sandstone of

Cheshire, and some parts of Lancashire, especially in the neighbourhood of Liverpool, the trees will continue in fertility for a great many years without any necessity for lifting. I have found, however, that whenever a fruit tree goes wrong the fault mainly arises from the soil and the way trees in it are treated in respect of soil, moisture, and manure, for to be successful the cultivator must so modify his practice as to meet the requirements of the trees under a variety of circumstances.—G. ABBEY.

LEAF MOULD FOR RHODODENDRONS.

A YEAR or two ago Mr. Wright brought under the notice of readers of the Journal the manner of using leaf mould as practised by Belgian nurserymen. It so happened that, having had to deal with a vast accumulation of leaves decayed and undecayed, the notes in question interested me much, as showing, for one thing, the absolute safety of growing plants entirely in leaf soil. The result of one experiment we had made with Rhododendrons has proved so satisfactory that I am induced to send a line or two in order to call attention to this subject again. We had several beds of Rhododendrons to plant, and unfortunately had very poor material to plant them in, the soil being of a half-sandy half-gravelly nature. Peat could be procured by carting from a distance of twelve or thirteen miles, but this was as poor for peat as our natural soil was when compared with fairly good soils. The result was that we reverted to the ancient heap of leaves.

The way the beds were prepared was simple enough. The turf was first skimmed off the surface, then a spit of the soil thus uncovered was wheeled away and utilised in making up irregularities in the lawn near by. The decayed leaves were afterwards carted to the beds thus roughly formed and put on to a thickness of 9 to 12 inches. Among this the Rhododendrons were planted firmly. A little soil was thrown over the surface. These plants were the only ones which were left to their own resources, so far as watering was concerned, of many that were planted at the same time; yet the three seasons in which they have been planted they have grown so rapidly that a process of thinning cannot be long delayed if the plants are to thrive. Many of the shoots are this summer making eight growths, strong and healthy. That the beneficial effect of leaf soil is not confined to these alone is very markedly shown just now in the case of some Foxgloves which were sent me last summer and planted in these beds. Some of these have thrown several flowering stalks, which have already grown to a height of 7 and 8 feet, one stem measured being 4 inches round, and young flowering growths are being thrown out from the axil of each of the large leaves with which the stem is clothed. And so with Primroses which have grown up among the plants. The foliage is at the very least four times stronger than that of plants established on the grass round about, while the clumps are so large that many have had to be removed for fear of their doing damage to the rightful occupants of the beds.

The experience of this case alone is convincing as to the merit of leaf soil when used as it should be. As noted above, we used it to a good thickness, so that when firmed it practically resisted the effect of drought. The thickness of the layer has also had a farther good effect, which I have noticed as being absent when too sparingly used—that is, the roots have had a large field at their disposal. On the other hand, when too sparingly used the roots pick out the leaves first of all and stop growth for a while before fixing on the ordinary soil as a means of making farther progress. Then, I think, as the beds were not raised, but the leaf soil was buried beneath the surface, we gained an incalculable benefit. Rhododendrons will not stand drought, and perhaps the very worst treatment they can receive is to plant them in raised beds.

I may note, in conclusion, that I have seen failures in kitchen garden crops where leaf soil has been used, notably in the case of Celery and Leeks; but the fundamental fault has been a too limited supply of the material. If used in a large enough quantity to carry the plants on without check it is doubtless useful.—B.

SPRING CABBAGES.

FOR insuring good heads in good time more depends upon the time of sowing the seed than inexperienced persons are aware of. Nearly every district has its set time for sowing, a departure therefrom generally ending disadvantageously to those who attempt it. We are somewhat awkwardly situated, and have to strike out a line for ourselves. The climate is favour-

able to gardening, but the soil is heavy and cold, and rests on nearly solid clay, otherwise we might compete more successfully with still more southern counties. Varieties with a weakly constitution are of no use any more than they are in colder localities or other cold soils. At one time I used to be under the impression that the weakness or inclination for one particular variety in a district was a mere fad, but I have been obliged to modify that opinion, as there are strong proofs that a certain variety and a certain time of sowing are desirable and wise in many districts. Sown on July 10th Ellam's Early bolted; sown a fortnight later the plants remained stationary till the spring, and were, in fact, scarcely in advance of those not planted till early in the spring. Veitch's Matchless, on the other hand, under precisely the same treatment, succeeded admirably, and this variety, being sufficiently robust without approaching coarseness either in habit or quality, will be the most extensively planted this autumn.

Market growers that I am acquainted with round London seldom sow Cabbage seed before the third week in July, and in some parts of Kent if I remember rightly the first week, and even the second week, in August is considered the proper time for sowing. As large Cabbages are preferred for the markets, such as Early Enfield, Battersea, and Heartwell Marrow are the most extensively grown, but for private gardens I prefer the last named, as the others are usually somewhat inferior in quality. Immense close hearts are not appreciated by anyone who knows what is good in the way of vegetables, but neat little conical-shaped and only moderately firm heads are. Three of these can be and ought to be grown where one of the large ones are produced, and if a second crop is to be taken from them such as Ellam's Matchless and Heartwell will yield these quite as well as the coarser growers. Hill's Dwarf Incomparable is also worth a trial. It can be planted as thickly as Coleworts, as it makes but few outside leaves, and the hearts small and conical in shape are of excellent quality. Reading All Heart is a great favourite with many, and deservedly so, as it is very profitable, the quality being first-rate. In no case would I advise anyone to rely exclusively on one variety of Cabbage for the spring crops, as they vary in habit somewhat according to the season, and a variety, excellent in every respect one year, may prove disappointing the next.

Having decided what shall be grown, and when it is advisable to sow, the next proceeding is to prepare the seed beds. An open spot is best. A liberal dressing of leaf soil or some substitute should be well mixed with the surface, and the plants later on will lift all the more readily. If the seed is to be sown broadcast, first well damp the finely broken surface, then distribute the seed thinly, and lightly cover with fine soil. If drills are preferred, and one plan will do as well as the other, have them about 1 inch deep, and as thickly as they can be drawn, well moisten them if at all dry, sow very thinly, and level over. In some gardens birds are very apt to pull up the newly germinated seeds, and in this case it is either necessary to net over the beds or to red-lead the seeds before they are sown. The last is a very simple and most effective remedy, though why the birds should refuse to touch the tasteless red lead is a mystery to me. We moisten the seeds in a damp cloth and then well shake them up in a tin containing a small quantity of dry red lead. If the seeds are unduly wetted, say by sprinkling with water, they are apt to clog together in the lead and cannot be sown readily, but since I hit upon the plan of using a damp cloth the birds have not tasted any of our Broccoli, Cabbage, Turnip, and other seeds. Slugs must be kept down by hand-picking and occasional coatings of soot and lime, and if the seedlings come up thickly they ought to be freely thinned out in order that sturdy plants may be obtained. If the first sowing fails or is inadequate, sow more seed at once, and two sowings at an interval of a fortnight between may well be also made by those who are uncertain about the time to sow. As before pointed out, the plants if reared too early are liable to bolt prematurely, while if too late they may not have time to become established before the winter.

It is useless to attempt to grow really good Cabbages on poor ground. They should either be planted on newly and freely manured soil, or in succession to a crop for which the ground was heavily manured, nothing being more suitable than the bed recently cleared of the spring-sown Onions. In the latter case no digging is necessary, all that need be done is to clear off all weeds and generally break up the surface with hoes. The plants will not thrive on land poisoned with manure, as in such positions, if they escape the disease known as clubbing, they yet refuse to root freely, and unless they take good hold of the soil it is very certain the produce will be poor. Light, and perhaps over-manured soils, will be benefited by a sprinkling of

common salt or nitrate of soda, while medium and heavy soils will be improved by a liberal addition of either lime, soot, wood ashes, burnt garden refuse, or a mixture of all procurable, a sprinkling of salt being of good service on all but the heavy clays. In some cases, or where there is a good depth of workable soil, a little of the subsoil may well be mixed with the surface as the ground is being double-dug. It amounts to this, if we manure heavily we must also crop closely, or otherwise the soil is apt to become sour and inert, but we must not expect heavy crops from poor and badly manured ground. The plants should be put out before they are crowding and spoiling each other, and in our case are usually established by the end of September. We also plant rather more thickly than is generally done, as we can neither afford to follow nor believe in the practice of wide planting. For the larger sorts distances of 15 inches in the rows, and the rows 18 inches apart is ample, while those of medium growth, such as Ellam's Matchless and Heartwell, may be safely and most profitably planted 15 inches apart each way, every inch of ground being thus utilised and no coarse heads grown. We plant in shallow drills, well ramming the soil about the roots, and water them in. If it is necessary to plant in dry weather both the seed beds and drills are well moistened a short time prior to planting, this greatly facilitating the work.

Where clubbing is prevalent, or if the plants lift badly, the old-fashioned plan of puddling the roots in a mixture of clayey soil and soot is to be commended; this, to a certain extent, checking the ravages of the insect causing the disease, as well as gives the plants a good start, puddled plants not flagging so badly as others lifted without a ball, and not so treated. Dustings of soot and lime serve to keep down the slugs, and occasional surface hoeing is all that is necessary till the crop is perfected. If left for a second or third crop they frequently prove very profitable, but they exhaust the ground surprisingly. Sewage applied rather strong between the rows appears to suit Cabbages admirably.—W. IGGULDEN.

ORCHID CULTURE—PRUNING.

ONE of the most showy Orchids we have is *Dendrobium densiflorum*, but the great drawback to its usefulness is the short time its flowers remain in perfection. This may be overcome in some degree by having a dozen or more of plants, and placing them into heat at intervals to get them into bloom. I have grown this species in several different ways, but have found it succeed best with the following treatment:—When a plant has flowered I remove all the old growths that have lost their leaves, or have flowered from every node likely to produce blooms, and place it in a temperature of about 60° at night, and from 70° to 80° by day. I am not particular to a few degrees, but act according to the outside temperature. There the plants soon make their young growths. They remain in this temperature until they are matured, when they are removed to a more airy house to thoroughly ripen and rest. During the time the plants are growing they are shaded from the sun and well supplied with water; in fact, they are never allowed to become dry when at rest, for if they lose their roots the young growths do not start so strongly another season.

I have some plants of *D. densiflorum* that have already finished their growths; these will be removed to a more airy house soon, when by autumn they will be thoroughly ripened. Some of this year's growths are more than 2 feet long, and 3 inches in circumference round their thickest part, with six broad green leathery leaves on the upper part of the pseudobulb; from the base of these I hope to get some fine racemes of flowers. Plants that have now finished their growths and are well ripened will flower on this year's growths next season, but I have never succeeded in getting more than two racemes from one growth at the same time, therefore I always keep the growths on the plant until they are two years old, and then, if by chance they are not flowered from every node, they are allowed to remain on another season. These that do not make their growths early in the season seldom flower on the one-year-old pseudobulbs, and often when they are two years old they have not flowered from more than two nodes. These growths should be allowed to remain on the plants till they are three years old, after that age it is seldom they bloom. I grew two plants side by side, one was pruned—that is, had all the old useless growths taken out, the other had all the old growths kept on the plant, both were treated in the same way exactly in other respects. The pruned plant made the best growths and flowered the best. I use nothing but peat and charcoal for potting *D. densiflorum* in, sometimes a little soot water is given them during their growing season. My late employer was so enamoured with

D. densiflorum, that when on his death bed he expressed a desire to see a plant I had then in bloom. The plant was in a 7-inch pot and had fifteen fine racemes of fully expanded blooms on it.

Some people are of opinion that it is essential that the old growths should be left on the plants. This may be so in their native country when they are for weeks together without water; the old growths might then store up some supply of moisture for the green leaves to feed on, but this is only theory on my part. Most plants are improved by cultivation, and why should not Orchids be improved if assisted in their native country like we assist plants in our garden? I pass over your correspondent Mr. B. D. Knox's remarks as not being worthy of notice, except to observe there is a wide difference between a man exhibiting a scientific instrument for an advertisement, and exhibiting a plant to prove that it could be grown under different treatment to the orthodox rule.—H. C. P.

YOUNG VINES FOR EARLY FORCING.

(Continued from page 528, last vol.)

Two years ago a few young Vines were planted with those that had previously been in 14-inch pots. These young Vines were allowed to grow to the centre of the house, which is a low span-roofed structure, and at pruning time were only shortened back 1 or 2 feet, the canes being left sufficiently long for the extreme eye of the cane to reach the roof of another on the same side. These canes directly they commenced breaking were pegged upon the surface of the border as near the front of possible, thus forming a row from end to end of the border. When the shoots had grown a few inches in length the most promising were selected and the remainder removed, the shoots left being about 18 inches or a little more apart. When the shoots were from 6 to 9 inches in length, the canes from which they sprung were covered with a few inches of light soil for the purpose of inducing the formation of roots from every joint where the shoot issued. All shoots that took the lead were pinched when about 18 inches long to give the weaker and later ones a chance of gaining strength, so that the whole would grow evenly. The shoots near the extremity of the canes and close to the roof were at first the most vigorous, but the pinching had the desired effect. When they were 18 inches or a little more in length, root-action commenced, and the young canes soon gained strength and grew vigorously. They were allowed to extend about half way up the roof, when they were again pinched and the lateral growths removed to induce the main eye to again lead away. The old fruiting canes were removed, as the crop was cut, which had chiefly been towards the centre of the house. The young canes were then allowed to extend to the ridge of the house on either side, and were again stopped. By this time they had a good number of roots, they were very vigorous, and by the end of the season perfected strong fruiting canes with bold prominent buds towards the ridge of the house. The stopping and pinching of the lateral growths were the same as has been recommended frequently for young Vines in pots. The canes were ripe, and allowed of pruning being done towards the end of September or early in the following month. They were shortened very little, on an average 1 foot each. By this simple process we were in possession of a house full of fruiting canes much stronger and earlier ripened than could possibly have been the case if the Vines had been raised from eyes and grown in the usual way. The labour in production was not one-tenth of what would have been required to produce this number of Vines of the same size and strength from eyes.

It may be interesting to note the effect stopping the leaders had upon the Vines. Those pinched at the eave of the house are decidedly the strongest canes at their base. It may be said these were the strongest to commence with, some of the weaker ones being stopped as well as those that started first into growth. The stopped canes in every instance are showing bunches over a much greater length of their canes than those that were not stopped. Those that were stopped commenced the formation of roots, and then grew afterwards with greater strength and vigour than the unstopped canes. The marked superiority of the stopped canes is so apparent that all will be stopped in the future, and again before they are half way up the roof.

The crop of fruit will be taken from the centre of the house, as near the top of the Vines as possible, which will allow of a strong young cane being brought up from the base and trained to the old stem, the whole of the lower lateral shoots being gradually removed from the old cane as the young one advances in growth. When the fruit has been cut the old canes will be removed and the house will again be full of young canes for the following season's crop.

The Vines certainly will require renewing under this system, but I do not doubt they will continue to bear good crops of fruit for at least five or six years at the very least, and this in a border from 18 to 20 inches in width, and about the former in depth. When young canes are run up annually the entire length of the roof they have a good chance of recruiting themselves for the following year's work. When they require renewing, however, if the border will allow of an addition to its width all the better, then young rods can again be pegged down, and a stock of year-old Vines established in the place of those that had been fruiting. A crop need not be lost, for the canes run up from the old stools can be fruiting towards their tops as usual, while the young canes can be trained to them instead of taking them from the base of the old stool. Undoubtedly the best system of maintaining an early supply of Grapes is to

fruit one side of the house annually while the other is being grown for the following season. By this system of fruiting and resting the Vines alternately as heavy a crop of fruit could be produced from one side of the house annually as if both sides were allowed to carry fruit. The Vines should not be overcropped when they are to go on fruiting for five or six years, but when fruited and then allowed freedom from fruit-bearing the following season they would be capable of carrying nearly double the weight of Grapes. Under this system the Vines would be trained up the roof about 18 inches apart, which would allow ample room for the development of foliage on the close-pinching principle that should be followed. Every alternate cane should be allowed to extend to the ridge of the house, while the remainder should be stopped at about 18 inches below the ridge, which would allow more room for the foliage of the lateral shoots bearing the bunches. The foliage of these Vines must be preserved in good condition until the end of the season, and at pruning time the whole of the rods can be cut close back to the base, and young canes trained up again the following season while the opposite side was bearing fruit. Under this system the Vines, as well as the soil, could easily be renewed either by retaining a few canes free from fruiting, lifting out the soil from amongst them and supplying fresh compost, or by raising sufficient Vines in pots for pegging on the surface of a new border the whole length of one side of the house. This is preferable, no doubt, after a number of years, but under this system of fruiting the canes every alternate year they would remain healthy, retaining their former vigour for many years without being renewed.

I have such faith in this pegging-down plan, that had I a house to plant with permanent Vines I should in future obtain or grow sufficient canes of the sorts required—to save time I should purchase them—and would either plant out the Vines or plunge the pots in the newly made border, pegging down the Vines, then taking up from them temporary as well as permanent canes. This effects a considerable saving of labour, and no Vines raised from eyes would make in one season the same progress, or attain the same strength.

I lay no claim to originality for the system detailed; it may be new, and it may not, but I have never seen it practised elsewhere, nor detailed in any gardening periodical. Those who have Vines in pots that have failed to show fruit this season will be amply repaid, if they require early Grapes another season, if they prepare at once a small border and peg upon the surface the Vines that would otherwise be conveyed to the rubbish heap. They will have by autumn a stock of fruiting canes that will be in good condition for early forcing, and upon which they may rely for a good crop if well and thoroughly ripened with considerably less care and labour than growing Vines from eyes.—WM. BARNES.

OLD-FASHIONED ROSE PRUNING.

ABOUT two or three weeks since I observed a cottage garden, the high cultivation of which had been once approvingly recorded in the pages of the Journal, all aglow with such a blaze of Rose blooms as one does not often see, about a dozen trees (dwarfs), dark and light, of the best varieties of Hybrid Perpetual. On inquiry I found those trees had been pruned late in autumn by shortening the shoots by 3 or 4 inches and then leaving them to Nature. The winter was mild, the spring was late; the little garden has a favourable exposure and the most careful attention, and certainly the results up to this moment are most satisfactory.

But I am by no means dissatisfied with my own practice, based upon the experience of known authorities and followed for years by myself—viz., merely shortening long shoots in autumn, and then as soon after March 1st as may be pruning according to habit and constitution of each individual variety, and in spite of some wet weather in May and ungenial days in June, what a display (July 10th) one has now! Not yet here at its height—later perhaps than others, but enough to repay any labour, any anxiety. Gorgeous blooms of Duke of Teck, rich trusses of Général Jacqueminot, the velvet clusters of Duc de Rohan and La Rosière, the dusky Sultan of Zanzibar and Reynolds' Hole, and then the delicate beauty of the paler Roses in every shade of rose, blush, and white. Teas here have done extremely well, and wall Roses carried grand sheets of bloom; Reine Marie Henriette being specially fine in size and shape, charming for her clear violet cerise rose or colouring. Rêve d'Or has been very fine and of a deeper tint of yellow than usual. Again I say, How one is repaid! In our northern climate (Mid Lincoln) Roses sometimes may take longer to establish themselves, but patience and perseverance—only wait and work, and success is certain; and the Rose is sweet, and the Rose when she is understood is incomparable.—A. M. B.

LETTUCES ON CELERY RIDGES.

I AM very pleased that your able correspondent, Mr. J. Muir, has drawn attention to the above subject, because I feel that it is well worth attending to. In my present situation we grow all our Lettuces on Celery ridges, and have done so for a number of years. We grow a large quantity for the house, for we cut on an average five dozen every morning all the summer and until Celery comes in the autumn. I am quite sure there

is no finer Lettuce grown than what is produced on Celery ridges, and we seldom lose any young plants by the ravages of slugs, as is generally the case with Lettuces planted on the level.

We are not like your correspondent, as we give to our ridges a very slight manuring before the trenches are thrown out; but this is done, not that the Lettuce may receive the benefit particularly, but that all the ground may be in the same condition when the Celery is taken off. I think it is the great depth of soil that produces such large crisp heads, well worthy the place on an exhibition table, for I have noticed that when earthing Celery that the roots have been cut at a great depth down, like cutting Carrots, Parsnips, or any such tape-like vegetables.

In regard to winter Lettuces, we always throw up a border very high at the board side, so that it forms a sharp slope; the winter rains can then get away from the Lettuces, and out of many thousands we hardly ever lose a dozen plants. This, I am sure, saves a great destruction by slugs, as the bank being continually dry at the top prevents them from travelling, as they would do on land not thrown up in this manner.—H. H., *York*.

ONCIDIUM VEXILLARIUM.

THIS very excellent species may justly rank among the best. The panicle is lax, with about six or seven branches, and it grows about

Fig. 7.—*Oncidium vexillarium*.

2 feet high. It is very handsome on account of the number of fairly large flowers, the labellum being $1\frac{1}{4}$ inch across, and of beautiful bright yellow colour. The above name was kindly given me by Professor Reichenbach, who remarks that it is allied to *O. bifolium*, but much grander. It was thought by a well-known cultivator to be *O. varicosum*, but it differs from that species in the labellum, which, instead of being round, has a decided tendency to an oblong shape in the direction of width, and it also differs by having very much shorter wings at the base of the labellum.

It may be in some collections, I believe, as *O. Rogersi*, but it is not, I think, so fine a plant. There are many favourite kinds, however, far less beautiful. Pot culture is best, using peat and sphagnum, and drainage must be carefully attended to, as a good supply of water should be given during the season of growth. The best place for it is at the cool end of the Cattleya house. The illustration was taken from a plant in the Cam-

bridge Botanic Garden, received thero from Glasgow by the liberality of Mr. Robert Bullen.—R. I. LYNCH, *Cambridge Botanic Garden*.

THE CUCUMBER DISEASE.

THE head gardener and myself feel very much indebted to you for your answer and illustration in regard to the diseased Cucumber roots, and pressure of work has caused the delay in acknowledging the same. We followed out your advice, and turned out the plants, soil, and everything attached close to them.

We procured soil and manure from different localities, and I am very pleased indeed to be able to state that we have now at the present time one of the finest crop of Cucumbers that ever was grown. I have seen large crops photographed to push forward some particular kind, but never have we seen anything to equal what we have hanging at the present time, although it is only seven and five weeks respectively since the plants were planted into their present quarters.

I may here add that we have several kinds in the same house—viz., Telegraph, Telephone, Paragon, Metcalf's, and Duke of Albany; but the best in quality and productiveness are Telegraph, Duke of Albany, Paragon, and Telephone. Paragon being an excellent kind will be much grown by us in the future, but Metcalf's will not again be attempted, as with us it is much below the average.—H. H., *York*.

THIS most troublesome (so-called) Cucumber disease—the blistering and decay of the foliage—according to my experience, is easily prevented. One or two correspondents came very near my views lately, one recommending fresh soil and fumigating, the other fresh soil and quicklime; but my remedy is to give this plant healthy food and air from first to grow in. The best that I can get is loam, such as green sods off a roadside, or the edging of the walks chopped roughly with the spade and put in the frame or house as required. This, with free ventilation as the weather permits, will give good returns. I am convinced this affection of the Cucumbers is caused by superabundance of the gases evaporating from unhealthy soil and confined in the frames.—GEO. MURRAY, *The Gardens, West Ashby Manor, Horncastle*.

[We suspect our correspondent has not bad to combat the terrible disease that for so long baffled the efforts of such excellent cultivators as Mr. William Taylor when at Longleat, and Mr. Harding at Orton Hall, and others to subdue it.]

MR. SLAUGHTER'S ROSE GARDEN.

Is there a rosarian who has not heard of the name and fame of Mr. Alfred Slaughter? Within the last three years he has made such a sensation in the Rose world, that questions have been raised as to where and how he grows such beautiful flowers. Curiosity has been further stimulated when Mr. Slaughter has openly avowed that all his Roses were produced from a small garden barely one-eighth of an acre in extent. Experienced growers were incredulous. They who grew Roses by the acre, and who sometimes found themselves not up to form on show days, believed it was simply impossible. Determined to satisfy myself, I, with my friend Mr. John Sargent of Reigate, well skilled in the secrets of Rose-growing, and equally desirous to see how such results as Mr. Slaughter achieves were attained, took the train to Steyning on the 6th inst., and surprised Mr. Slaughter in his preparations for the National Rose Show. He received us most courteously and at once conducted us over his garden, and explained his method of cultivating the Rose for exhibition. What a strange sight presented itself! Fancy might have led us to expect one blaze of bloom. We looked in vain. Instead of Roses, we saw, indeed, a tiny garden, looking more like a refuge for old rush hats, tin pots, and decayed umbrellas. Then there was an appearance of bushes in curl papers. These with sundry other contrivances we found to be merely protections from the blazing sun, for underneath of most of these hats, pots, and umbrellas was a blushing Rose, and in the curl papers a lovely Tea, safe and snug, waiting to be removed to the exhibition box.

I will now describe the garden. It is a triangular piece of ground really but one-eighth of an acre in extent, on a slope facing the north-west. The trees are planted but 1 foot apart with 2 feet between the rows; each tree is only allowed to make from five to nine shoots, and every shoot is tied out to a stick, while all side ones are promptly removed; consequently the strength of the plant is concentrated on a few flowers. The ground is the natural soil of the district, but heavily manured in the autumn and mulched in the spring with cow dung. The total number of plants is between 1400 and 1500. This is the whole of the material with which the results are achieved. "The secret of my success," Mr. Slaughter says, "is that I do everything myself. I bud, prune, and do all that is required. The only assistance I ever have is in watering. I work all the year round amongst my Roses and keep them always going. It is a great mistake to neglect them at any time. By the plan I adopt I hardly have any bad blooms."

After all this is but simple common sense. A Rose is like a racehorse, which must be properly trained and ridden to win the race. Mr. Slaughter is to be compared to a good jockey who knows exactly what his horse can do. His practice disposes of the old theory that to be a successful prizewinner it is necessary to have a very large number of Roses. Quality, not quantity, is what he aims at, with the following results:—In 1883 he won forty-four prizes and the trophy; in 1884, thirty-eight prizes; and this season he has gained already twenty-one prizes at six shows. At Tonbridge and Sutton he took the four first prizes, but at the

National he was not successful. He evidently over-estimated his strength, and flew at too high game. To exhibit 150 Roses against such competition and without assistance was beyond his powers.

Thus the amateur with limited means may derive much encouragement. He will see that a small garden has its advantage, each plant receiving an amount of care and supervision that will produce more satisfactory results than a larger number.—F. C. PAWLE, *Hon. Sec. to the Reigate Rose Association*.

At a general meeting of the ROYAL HORTICULTURAL SOCIETY, held last Tuesday, Mr. Maurice Young, F.R.H.S., in the chair, the following candidates were unanimously elected Fellows—viz., The Comte de Valbamey, Wm. Ellis, Wm. R. Harford, James Higgins, G. C. Leaver, Sir Herbert E. Maxwell, Bart., M.P., Mrs. Spencer Meade, A. E. S. Sebright, W. H. Smith.

— THE ninth Exhibition of the NATIONAL CARNATION AND PICOTEE SOCIETY (southern section) will be held in the conservatory of the Royal Horticultural Society on July 28th. The Treasurer, Mr. H. A. Rolt, 170, Hartfield Road, New Wimbledon, will be glad to receive subscriptions or donations to make the Exhibition a financial success. He requires £20 more than he has yet received. The prizes have to be paid immediately after the Exhibition. A few friends came forward and generously subscribed the funds to make the Auricula Exhibition a financial success. The Committee hope that the more popular Carnation Exhibition may receive at least equal support. A few old subscribers annually fall off, and if each member would obtain one new subscriber the success of the Exhibition would be assured. Intending exhibitors will please to send their entries to Mr. Barron, Royal Horticultural Society, South Kensington, at least four clear days before the 28th.

— A CHRYSANTHEMUM SHOW IN MAY.—Some years ago Mr. Forsyth was a well-known exhibitor of Chrysanthemums at the London shows, and assisted greatly in extending the popularity of that plant by his productions. Now he is performing a similar office in New Zealand, and has succeeded in forming a Society which has held several shows. The *North Otago Times* of May 11th, just to hand, records the success of an exhibition held two days previous, and remarks that it "more than exceeded the anticipations of those who went so far as to say it would be the best thing of the kind ever held in the colony, and those who have witnessed the Chrysanthemum shows of the old country say it was better than anything they ever saw there." Mr. Forsyth was one of the principal prizetakers, and we congratulate our far-away friends on their success with a plant which must bring to some very pleasant memories of the mother country.

— MR. A. J. BALLHATCHET, who has been gardener and bailiff to Dr. Temple, late Bishop of Exeter, for six years, continues in his Lordship's service as head gardener and bailiff at the Bishop of London's residence, Fulham Palace.

— Is sufficient of the NIGHT-SCENTED STOCK, *Matthiola bicornis*, grown in gardens? No plant is more easy to grow, as the seed only requires to be sown like that of any other hardy annual, and there is no flower that renders gardens more delightful after nightfall than this highly fragrant Stock. For growing near windows that are open during the sultry nights of summer this simple annual has claims that are not surpassed, if equalled, by any other plant. It is not striking in appearance, but is still pretty, while its perfume after dark is as wonderful as it is powerful and refreshing. In the daytime the flowers are quite scentless, but at night they are delicious, and everybody having a bit of land, rich or poor, may grow them.

— MESSRS. IHLEE & SANKEY, the London agents of Messrs. Balfour and Co., Longton, Staffordshire, have sent us examples of FLOWER POTS of a very superior character, both as regards design, material, and workmanship. For halls, balconies, windows, prominent positions in conservatories—in fact, wherever plants are required in something more presentable than common flower pots, these very neat and chastely ornamental forms will be acceptable, and without doubt plants will

thrive in them at least as well as in ordinary flower pots. The new ware is red, smooth, appropriate for the purpose, in excellent taste, and considering its quality we think the reverse of costly.

— THE following GARDENING APPOINTMENTS have been made through Messrs. John Laing & Co., Forest Hill Nurseries:—Mr. Barnett as head gardener to—Miller, Esq., Cedar Villa, Kensington. Mr. Bond, lately at Beechholme, New Hampton, as head gardener to H. Barry, Esq., Bush Hill House, Winchmore Hill, Middlesex. Mr. Leiper as head gardener to W. Wilson, Esq., Parkholme, Richmond.

— THE eighteenth annual Show of the CHEADLE FLORAL AND HORTICULTURAL SOCIETY will be held in Dr. Godson's field on August 21st and 22nd this year, when prizes will be offered in eighty-two classes for plants, fruits, flowers, and vegetables. In the open and amateurs' classes for ten stove and greenhouse plants the prizes are respectively £10, £7, and £4. This is invariably one of the best Exhibitions in the district, and it is expected that the Show this season will fully equal those of previous years.

— IN referring to the ROSE LUSIADES, which was sent out on the Continent some time ago at the price of 50 francs, M.M. Soupert et Notting, writing to the *Journal des Roses*, state that they have flowered the plant, and they "certify that it is nothing else but Noisette Celine Forestier." The flowers were said to be golden yellow with carmine spots, and the announcement caused a sensation amongst Continental rosarians.

— A CORRESPONDENT sends the appended note. "At a recent meeting of the French Academy of Science the question of POISONS IN EDIBLE MUSHROOMS was discussed, and M.M. Roux and Houde presented a report upon some poisonous products which they had obtained from Mushrooms purchased in the market. Half the Mushrooms were eaten fresh without any bad result, the other half was allowed to putrefy to a slight extent, and were then submitted to treatment with a view to extract the alkaloids. Four were separated, and these, when injected into the tissues of guinea pigs, brought about death with symptoms of intoxication."

— THE ODOURS OF ROSES have been classed in seventeen divisions as follows:—"Sweet Briar scent, as in the garden variety; Moss Rose scent, as in common Moss and family; Austrian Briar scent, as in Copper Austrian and family; Musk Rose scent, as in Narcissus, old Musk and family; Myrrh scent, as in Ayrshire splendens; China Rose scent, an astringent refreshing scent, as in old Monthly China and many others; Damask Perpetual scent, as in Rose du Roi, &c.; Scotch Rose scent, as in the early double Scotch; Violet scent, as in White Banksia; Old Cabbage scent, as in the well-known double Provence; Otto Perpetual scent, as in Charles Lefebvre, Madame Knorr, &c.; true Perpetual scent, as in Chabrand, Pierre Notting, &c.; Old Tea scent, as in the old yellow Tea or Magnolia Rose, and others almost unpleasantly strong for some tastes; Sweet Tea scent, as in Goubalt, Maréchal Niel, &c.; Hybrid Tea scent, as in La France; Nectarine, or fruit scent, as in Socrates, Jaune Desprez, Aline Sisley, &c.; and the Verdier scent, represented more or less by all the Victor Verdier hybrids, such as Eugénie Verdier, Marquise de Castellane, Countess of Oxford, Marie Finger, &c. The petals of the highly scented varieties have on their inner surface minute perfume glands or vesicles, containing the highly volatile essence, under the microscope distinctly visible. Those on the petals of Sweet Briar and Moss are almost visible to the naked eye."

— AN interesting letter from the naturalist of the Afghan Delimitation Commission, Surgeon-Major Aitchison, to Sir Joseph Hooker, describing the FLORA OF NORTHERN AFGHANISTAN, is published in *Nature* of the 8th inst. He mentions that in this tour he collected about 1200 specimens, representing one hundred species, many of which are not in cultivation. One plant is especially mentioned as likely to be of garden value—namely, *Rosa Margerita*, respecting which he states that "it covers the whole country in localised patches, and being dwarf in habit, not above 2 feet, the flowers are seen to perfection. They open out, expanding almost flat, when the brilliant eyes formed by the claret-coloured bases of the petals give it quite a character." There are also some floral districts thus described:—"From the moment of entering these valleys they seem a mass of colour—one from Buttercups (one species only), another from a Poppy, the bed of a stream purple with a tall Onion, and the interstices green with various Grasses."

— MESSRS. RICHARD SMITH & Co., Worcester, have sent us sprays

of WHINHAMS INDUSTRY GOOSEBERRY, presumably an American variety. The sprays are heavily clustered with large fruit so crowded together it might be gathered in handfuls. When ripe it is red. At present it is quite green, and whatever the quality may be when fully developed, such examples as those before us clearly indicate the great prospective value of the variety for gathering green for market purposes, as it appears to possess the coveted properties of earliness, size, and extraordinary productiveness.

— THE Committee of the PRIMULA CONFERENCE announce that the Exhibition will take place in connection with the National Auricula Society, April 23rd and 24th, the following provisional programme having been drawn up:—Class I., The Auricula; II., The Polyanthus; III., Varieties of *Primula Sieboldi*; IV., Varieties of *Primula sinensis*; V., European species and varieties of the genus *Primula*; VI., Himalayan species and varieties of the genus *Primula*; VII., Chinese and Japanese varieties of the genus *Primula*; VIII., American and Japanese varieties of the genus *Primula*; IX., Species and varieties of *Primula* not included in the above; X., Plants allied to the genus *Primula*; XI., Specimens, models, and drawings illustrative of the structure and mode of growth of the Primulaceous plants. The meeting and reading of papers and discussion will take place on April 24th, 1886, the following being the programme as at present arranged:—1, The origin of the florists' Auricula; 2, In what directions should efforts be made with the view of improving the florists' flowers belonging to the genus *Primula*; 3, The nomenclature of Alpine Primulas; 4, Culture of hardy Primulas; 5, Root, structure, and mode of growth, as affording indications of the probable best culture.

— THE following is the SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, in June, as recorded by Mr. Joseph Mallender:—Mean temperature of month, 56.5°; maximum on the 4th, 80.9; minimum on the 27th, 33.5°; maximum in sun on the 15th, 129.3°; minimum on grass on the 10th, 29.2°; mean temperature of soil 1 foot deep, 57.7°; mean temperature of air at 9 A.M., 58.4°. Warmest day the 5th; coldest day the 10th. Nights below 32° in shade, 0; on grass, 3. Total duration of sunshine 175.5 hours, or 35 per cent. Maximum duration in one day, on the 27th, 14 hours; four sunless days. Total rainfall, 3.65 inches. Maximum fall in twenty-four hours on the 7th, 10.5 inches. Rain fell on twelve days. The mean temperature was slightly higher than any of the last six years, which have been very uniform. Maximum temperature higher than in any June since 1878. Rainfall more than in any of the last ten years except 1882. 2.4 inches fell on 6th, 7th, and 8th; and 1.0 inch on the 23rd and 24th, the rest of the month being dry. Sunshine more than in any of the last four years.

— A CORRESPONDENT of an American contemporary thus refers to Mr. JAY GOULD'S GARDEN AT IRVINGTON, NEW YORK:—"Everyone has an idea that Mr. Gould has an exceptionally fine property. Few realise, however, that it is fast becoming a place which will eventually rank with some of the best of those in Europe. The grounds are very extensive—several hundred acres, and the portions near the house are beautifully varied in character. The immediate foreground slopes to the Hudson River, and Mr. Mangold, Mr. Gould's superintendent, has introduced some particularly bold and effective groups of trees, which serve to heighten and emphasise the naturally bold character of the scenery in a particularly happy manner. Much of the planting and grouping is yet in a transition state. The magnificent new range of conservatories erected four years ago are now completely filled and yielding splendid results. The luxuriant health and high keeping of every department speaks volumes for the thorough practical knowledge and executive ability of Mr. Mangold. In the Palm house he had collected over three hundred species of Palms, and by the use of stages the very large house is already completely filled. There are fifteen houses in the conservatory range, embracing four vineries, Peach houses, Camellia house, Rhododendron house, Fern house, Orchid house, Rose house, Pitcher Plants (Crotons, and greenhouses. Beside the main range there is a range or smaller but indispensable houses; in these are many of the gems of the collection, *Lapageria alba*, *Ouvirandra fenestralis*, *Bertolonias*, and hundreds of others.

LORD NAPIER NECTARINE.

IF I remember rightly this variety was condemned as being useless either in an unheated house or the open air, and the fact of Mr. Hudson succeeding so well with it in an early house is no proof that Mr. Rivers' introduction was wrongly disparaged. We, too, find it very productive

and good in every respect when forced, being much superior to any other variety yet tried in an early house, but in an unheated house last season it was simply useless. The fruit were comparatively small and much scarred, the skin presenting a patchy dirty appearance, while the quality was anything but good. It is no fault of the house that the fruit was so poor, as the position could not well be improved upon. Neither do I think the treatment was much at fault, as other sorts, both of Peaches and Nectarines, perfected good crops. It may be a too free or a too late use of the syringe or engine has much to do with the disfiguring the fruit, as I observed that the fruit of Lord Napier in our early house were scarred wherever the water hung the longest, and an early discontinuance of syringing in the case of this variety will now be tried in the late house. I should be very sorry to have to discontinue the culture of this Nectarine in the unheated house, especially as the tree is growing and cropping most satisfactorily, but if it fails this season it will have to make room for a more reliable sort. If Mr. Hudson, or any other cultivator, will suggest the treatment that will insure the production in a cool house of fruit equal to or approaching in quality those easily obtained in an early house, he will confer a great favour on myself, and doubtless many other readers of the *Journal of Horticulture*.—W. IGGULDEN.

ROSE SHOWS.

THE NATIONAL ROSE SOCIETY (NORTHERN SECTION).

JULY 11TH.

THIS Exhibition was held on the date named in the large conservatory in the Botanic Gardens, Old Trafford, Manchester, when a really magnificent display was made. If not numerically so large as last year the quality of the flowers was certainly above that of previous displays, and all those concerned in it may be heartily congratulated upon the result. The exhibits were arranged on a central table and the side stages of the conservatory, which large amount of space was with the help of a few boxes of "spares" and non-competing stands well filled up. The central table was, indeed, handsome, as the numerous boxes of Roses were set off to the best advantage with excellent plants of Crotons, Dracenas, and Palms arranged by Messrs. R. P. Ker & Son, Aigburth Nurseries, Liverpool. But to pay proper respect to the queen of flowers we unhesitatingly assert that indwellers in Cottonopolis who flocked to Old Trafford in such large numbers have never seen a finer lot of flowers. Evidently they were fully appreciated. Granted the leading exhibits were staged by southern growers; yet still others not of the sunny south were of the first order. Between three and four thousand blooms were staged for competition, most of course by the trade, as most certainly there was not such keen competition in some of the amateur classes as could be desired. Messrs. Paul & Son maintained their honour in the large class for seventy-two blooms, and fine they were, very large, with scarcely a bloom too far gone, yet there was a rather coarse appearance in some. Both the Cants were somewhat below their usual standard of excellence. The Teas were weak, and many of the H.P.'s small, but all were of the best colour and very fresh. The Cranston Nursery Company came out well. It was a close run between them and Paul & Son, but the latter had the advantage of extra size. Mr. George Prince's Teas were magnificent; they could hardly fail to win. They and the others of the same class were the admiration of the Show. The majority of the amateur classes were good in character—especially good were those staged by Rev. Joseph Pemberton and W. J. Grant, Esq., while the Teas belonging to T. B. Hall, Esq., Rock Ferry, were simply perfection. A grand bloom of *Souvenir d'Elise Vardon* was selected for the silver medal, and one of Lady Mary Fitzwilliam for a similar honour.

The miscellaneous exhibits were not abundant but good. In addition to Messrs. Ker's foliage plants we noticed a good box of the Rose Mrs. Allen Richardson, prettily arranged with Maidenhair Fern, staged by Mr. John House. A fine lot of Mrs. Caroline Swales was shown by the raiser Mr. G. Swales, nurseryman, Beverley, Yorkshire; it is a beautiful deep blush Tea variety. A rich collection of species and varieties of curious Roses was shown by S. Barlow, Esq., Middleton, including Damasks, Fairy, Cluster, Single, and other kinds. Particularly showy were good bunches of Persian Yellow, old Crimson Damask, Paquerette, Crimson Moss, W. A. Richardson, Mignonette, &c. We learnt previous to leaving that the number of visitors was much in excess of last year, the weather being splendid. Much is due to Mr. Bruce Findlay, the energetic Curator, for his management of the show.

NURSEYMEN'S CLASSES.—In the premier class for seventy-two distinct varieties there were four magnificent collections staged, three of which vied closely with each other for the highest honours. Both of the Cants staged, but not in such strong force as usual. The Cranston Nursery Company, Hereford, and Messrs. Paul & Son, Cheshunt, had grand lots. The strongest competition was between Messrs. Cranston's and Paul & Son's stands, most of the blooms of each were of the highest merit. Some of them were weak in point of size. The Judges, however, awarded the highest honour to Messrs. Paul & Son, in whose collection the Teas certainly were very strong, some of them being unusually fine, especially Nipbetos, Innocente Pirola, and Comtesse de Nadallac. The varieties staged were as follows:—Back row—Edouard Morren, La France, François Fontaine, splendid; François Levet, Duc de Rohan, Capt. Christy, a magnificent bloom; Ulrich Brunner, Abel Carrière, Madame Eugène Verdier, Sénateur Vaisse, splendid; Nipbetos, Mons. Alfred Dumesnil, Madame Isaac Carrière, Marguerite de St. Amand, grand; Marie Rady, Innocente Pirola, Dr. Andry, Pride of Waltham, magnificent; François Michelon, Madame Lacharme, Sultan of Zauzibar, Maréchal Niel, unusually fine; Maréchal P. Wilder, and Queen of Queens, a splendid Rose. Middle row—Star of Waltham, Boieldieu, Souvenir d'Elise Vardon, grand; A. K. Williams, Koelle, Mlle. Eugénie Verdier, Manrice Bernardin, Marie Baumann, George Moreau, grand; A. K. Williams, the best bloom we have seen this season; Jean Ducher, Baronne de Medin, La Duchesse de Morny, Madame Gabriel Luizet, Louis Van Houtte, Catherine Mermet, Lady Sheffield, Merveille de Lyon, and Mrs. Baker, splendid. Front row—Emily Laxton, Jules Finger, S. Reynolds Hole, fine; Madame Cusina, Duchesse de Caylus, Marie Cointet, Madame Prosper Laugier, Pirola

Notting, Countess of Rosebery, splendid; Duke of Teck, Marie Verdier, Souvenir de Madame A'vy, Horace Vernet, Comtesse de Paris, Duke of Albany, very large; Alba Rosea, Madame Alphonse de Lavalley, Madame Thérèse Levett, Horace Verdier, grand; Souvenir d'un Ami, Comte Raimbaud, Comtesse de Nadaillac, immense; Edouard Andre, and Comtesse de Serenyi. The second fell to Cranston & Co., Hereford, the whole of whose Roses were fresh and well coloured, and they ran the premier collection very closely, but some of those in the front row were rather small. Cut blooms were Général Jacqueminot, Constantin Tretiakoff, unusually fine; Marie Baumann, Duchess of Bedford, Sultan of Zanzibar, Baroness Rothschild, magnificent; Madame Charles Wood, Lady Mary Fitzwilliam, an immense bloom; Dr. Andry, Madame Lacharme, Marquise de Castellane, Merveille de Lyon, A. K. Williams, grand; Le Havre, Mary Pochin, Comtesse de Serenyi, Lord Macaulay, and Horace Vernet. Mr. B. R. Cant and Mr. F. Cant were third and fourth respectively, both containing many magnificent blooms, but the Teas were weak in the third lot. Special mention may be made of Le Havre, Madame Charles Wood, Merveille de Lyon, A. K. Williams, Duke of Edinburgh, Madame Gabriel Luizet, magnificent; Madame Etienne Levett, Prince Arthur, Madame Prosper Laugier, and Souvenir d'un Ami.

In the class for thirty-six distinct triplets there were four lots staged, Messrs. Paul & Son again taking the lead with a collection which could scarcely be beaten; it was many points ahead of any of the others. The following were the varieties shown:—A. K. Williams, excellent; Maréchal Niel, Madame Noman, Néruda, Queen of Queens, again splendid; Pride of Waltham, Star of Waltham, Devonensis, Comtesse d'Oxford, Marguerite de St. Amand very large, Marie Rady, Merveille de Lyon, Ulrich Brunner, Maréchal P. Wilder splendid, Innocente Pirola, Charles Lefebvre, Madame Gabriel Luizet, magnificent; Sénateur Vaisse, Madame Lacharme, Alfred Colomb, Captain Christy, Edward Andry, Souvenir d'Elise Vardon, Madame Prosper Laugier, Jean Ducher, immense; Marie Baumann, La France, Catherine Mermet, Duke of Edinburgh, Niphotos, Countess of Rosebery, Horace Vernet, Beauty of Waltham, Edward Morren, Paul Neron, Dr. Andry, and Duke of Teck. The second fell to Mr. George Prince, Oxford, with very meritorious standards, the Teas and Noisettes being especially strong and good. The following were the best staged:—Niphotos, Lady Mary Fitzwilliam, grand; Marcelin Rhoda, very splendid; Mdle. Marie Finger, Marie V. Houtte, Mons. Noman, Catherine Mermet, Madame Gabriel Luizet, Souvenir d'Elise Vardon, magnificent; Merveille de Lyon, Madame de Watteville, most attractive; Princess of Wales, Maréchal Niel, and Violette Bouyer. The third and fourth awards were given to Mr. B. R. Cant and Cranston Company; the third collection staged some fine H.P.'s, notably A. K. Williams, Duke of Wellington, Duke of Edinburgh, and Marie Baumann.

For eighteen varieties, Teas or Noisettes, three splendid stands were staged. Especially praiseworthy was the leading one shown by Mr. George Prince; finer blooms could scarcely be exhibited. Back row.—Innocente Pirola, Maréchal Niel, Souvenir d'Elise Vardon, Jean Ducher, Niphotos, Annie Ollivier. Middle row.—Comtesse de Nadaillac, Hon. Edith Gifford, Madame Cusin, Alba Rosea, Louis Van Houtte, and Catherine Mermet. Front row.—Amazona, grand; Souvenir de Madame Pernet, Madame Marie Arnaud, Souvenir d'un Ami, Francisca Kruger, and Rubens. Messrs. Paul & Son, Cheshunt, were second, and Mr. B. R. Cant, third. There was not a bad bloom in either stand. The Cheshunt lot included magnificent blooms of Maréchal Niel, Alba Rosea, Souvenir d'un Ami, Comtesse de Nadaillac, and Caroline Kuster. Mr. Cant had superb flowers of Madame de Watteville, Maréchal Niel, Madame Cusin, and Souvenir d'Elise Vardon.

For thirty-six distinct varieties there was strong competition, not less than ten stands being staged, and on the whole most creditable. It was rather a difficult matter to decide between the two leading collections, but the palm fell to Mr. John House, Peterborough, whose lot throughout was first-class. Back row.—A. Colomb, Merveille de Lyon, Sir Garnet Wolseley, Marguerite de St. Amand, Countess of Oxford, splendid; Comtesse de Nadaillac, Duke of Wellington, May Quennell, Horace Vernet, Etienne Levett, Mons. E. Y. Teas, and Boieldieu. Middle row.—La France, A. K. Williams, Ulrich Brunner, Maréchal Niel, Duc de Rohan, François Michelin, Marie Rady, François Levett, Sénateur Vaisse, Duchesse de Vallombrosa, and Le Havre. Front row.—Marie Baumann, Captain Christy, Lord Macaulay, Catherine Mermet, Constantin Tretiakoff, Souvenir d'Elise, Star of Waltham, Anna Ollivier, Louis Van Houtte, Innocente Pirola, Abel Carrière, and Madame Lacharme. The second fell to Messrs. Curtis, Sanford, & Co., Torquay, whose finest blooms were Etienne Levett, Général Jacqueminot, Marie Rady, Merveille de Lyon, Baroness Rothschild, Madame G. Luizet, Barthélemy Joubert, and Duchesse de Morny. Messrs. J. Burrell & Co., Cambridge, was third, and Mr. H. Merryweather, Southwell, fourth.

For eighteen distinct triplets Mr. House again took the lead with splendid blooms, followed by Messrs. Curtis, Sanford, & Co., whose lot was also excellent. The premier stand consisted of the following varieties:—La France, Ulrich Brunner, Lady Mary Fitzwilliam, immense blooms; A. K. Williams, Merveille de Lyon, Louis Van Houtte, grand; Marie Baumann, Marguerite de St. Amand, Mons. E. Y. Teas, Catherine Mermet, A. Colomb, Baroness Rothschild, Madame G. Luizet, Horace Vernet, François Michelin, Marie Rady, Countess of Oxford, and Camille Bernardin. The Torquay exhibit included splendid blooms of Madame G. Luizet, Barthélemy Joubert, Merveille de Lyon, Général Jacqueminot, and Alfred Dumesnil. Messrs. John Jeffries & Son, Cirencester, were third with a fine lot. Special note was made of Madame Cusin, Niphotos, Horace Vernet, and Madame Charles Wood.

Mr. House was again first for twelve Tea or Noisette varieties, staging, if possible, above his usual style for such varieties. The following were staged:—Madame Willermoz, Maréchal Niel, Madame Bernardin, Jean Ducher, Souvenir d'Elise, Niphotos, Comtesse de Nadaillac, Souvenir de Paul Neyron, Anna Ollivier, Catherine Mermet, Devonensis, and Innocente Pirola. The second and third fell to Mr. J. Mattock, Headingley Nursery, Oxford, and Messrs. John Jeffries & Son, Cirencester.

AMATEUR CLASSES (Division C).—There were five collections of thirty-six distinct varieties staged, all of which were of high merit, the two leading ones were exceptionally good. The Rev. Jos. Pemberton, Romford,

took the lead, however, although it was generally admitted his stands were most keenly contested by the second lot belonging to W. J. Grant, Esq., Hope End Farm. The premier collection were as follows:—Back row—Star of Waltham, exceptionally good; La France, Exposition de Brie, Madame E. Verdier, Duke of Wellington, Etienne Levett, Ulrich Brunner, Mdle. E. Verdier, grand; John Stuart Mill, splendid; Marguerite de St. Amand, Horace Vernet, and Jules Finger. Middle row—François Michelin, Baron Boncenne, Comtesse d'Oxford, A. K. Williams, grand; Souvenir d'Elise, Louis Van Houtte, Madame H. Jamain, Marquise de Gibot, Niphotos, Mons. E. Y. Teas, Madame C. Kuster, and Auguste Rigotard. Front row—Madame Lambard, splendid; Etoile de Lyon, Harrison Weir, excellent; Duchesse de Vallombrosa, Dr. Andry, Innocente Pirola, Charles Lefebvre, Catherine Mermet, Abel Carrière, Jean Ducher, Pride of Waltham, and Madame G. Luizet. Mr. Grant's exhibit included many magnificent blooms, of which we may well mention Marie Cointet, Caroline Kuster, Horace Vernet, La France, Constantin Tretiakoff, Souvenir d'un Ami, and Madame G. Luizet. T. B. Hall, Esq., Larch Wood, Rock Ferry, was third, and F. W. Girdlestone, Esq., Sunningdale, Berks, fourth. The Rock Ferry Roses were most creditable. In the class for twelve distinct triplets W. J. Grant, Esq., was well to the front with a magnificent stand charmingly arranged, the lights being most effectively disposed. The following kinds were staged:—Ulrich Brunner, La France, Marie Rady, François Michelin, Constantin Tretiakoff, Marie Finger, A. Colomb, Duchesse de Vallombrosa, Beauty of Waltham, Madame G. Luizet, Louis Van Houtte, and A. K. Williams. T. B. Hall, Esq., secured second honours with fresh very richly coloured blooms. Some of the trios were perfection, notably the following:—Dupuy Jamain, Duke of Wellington, Madame G. Luizet, Duke of Edinburgh, Beauty of Waltham, and Marie Baumann. Rev. Jos. Pemberton was third. For twelve Teas or Noisettes T. B. Hall, Esq., was well to the front with a superb lot, splendidly finished and of good size, as follows:—Madame Lambard, especially rich; Innocente Pirola, Madame Cusin, Anna Ollivier, Jean Ducher, Marie Van Houtte, Alba Rosea, Souvenir d'un Ami, Comtesse Riza du Parc, Madame Margottin, Madame Willermoz, and Francisca Kruger. The second prize fell to Rev. F. Page Roberts, Scole, Norfolk, for a very excellent lot, among which was the best Tea in the Show, a magnificent bloom of Souvenir d'Elise Vardon, which was awarded the silver medal of the National Rose Society; besides this, others particularly good in the stand were Niphotos, Anna Ollivier, Comtesse de Nadaillac, and Madame Margottin. This collection lacked the rich-coloured varieties so noticeable in Mr. Hall's stand. Third, Rev. Jos. Pemberton, in whose lot was a magnificent bloom of Catherine Mermet.

In division D classes, the Rev. Lionel Garnet, Christleton, Chester, secured highest honours for twenty-four varieties, followed by A. Tait Esq., Woolton, Liverpool, both lots being very fine. The leading one consisted of the following:—Back row—Etienne Levett, La France, A. K. Williams, Louis Van Houtte, Baroness Rothschild, Marquise de Castellane, Annie Wood, Madame Prosper Laugier. Middle row—Duke of Teck, Dupuy Jamain, Merveille de Lyon, Ulrich Brunner, Maurice Bernardin, Lady Mary Fitzwilliam, Alfred Colomb, and Madame G. Luizet. Front row—Marguerite de St. Amand, Xavier Olibo, Horace Vernet, Souvenir de la Malmaison, Abel Carrière, Le Havre, Madame de Vallombrosa, and Comtesse d'Oxford. The following were especially good in Mr. Tait's collection:—Duke of Wellington, magnificent; Marie Baumann, Madame Eugène Verdier, Dr. Andry, Dupuy Jamain, Baroness Rothschild, and Merveille de Lyon. The only exhibitor in the class for eighteen distinct, single trusses, was Mr. W. Boyes, Milford, Derby, who staged fine blooms of Merveille de Lyon, Duchess of Bedford, Marquise de Castellane, and Lady Mary Fitzwilliam. For nine Teas or Noisettes a splendid stand staged by Rev. L. Garnett secured highest honours; as compared with the other two stands exhibited they were a long way ahead. Good flowers of David Pradel, Marie Van Houtte, Anna Ollivier, and Rubens were shown. The second and third fell to Alfred Tate, Esq., and Mr. W. Boyes in the order named.

Other amateur classes (Division E) were fairly well filled. For twelve distinct varieties Rev. Edward S. Fellowes, Wimpole Rectory, Royston, was a good first with mostly large well coloured flowers of the following:—Marie Baumann, La France, Marie Rady, Baroness Rothschild, Madame Gabriel Luizet, A. Colomb, François Michelin, Jean Liabaud, Louis Van Houtte, Souvenir d'Elise, Duke of Teck, and Maréchal Niel; the second fell to Mr. Ismay Fisher, Scawley, Brigg, in whose stand was a magnificent bloom of Lady Mary Fitzwilliam, which was adjudicated the best H.P. in the amateur classes, and received the Society's silver medal. Other most praiseworthy blooms were La France, Madame Lacharme, and Dr. Andry. W. E. Hall, Esq., Birkenhead, and Miss Mellish, Worksop, were third and fourth respectively. Three other stands were staged. In the class for six Teas or Noisettes there were nine lots staged. The first fell to Mr. Chas. E. Outhell, Dorking, Surrey, with an excellent lot, consisting of Jean Ducher, Maréchal Niel, Caroline Kuster, magnificent; Anna Ollivier, Alba Rosea, and Souvenir d'Elise Vardon. The second and third were awarded to Rev. E. L. Fellowes and Rev. A. Cheales, Brockham Vicarage, Surrey, in the order named.

EXTRA CLASSES FOR AMATEURS.—For twelve triplets of Teas or Noisettes the first prize was awarded to the splendid stand exhibited by Rev. F. Page Roberts, Scole, Norfolk, with the following varieties:—Jean Ducher, Mdme. Margottin, Niphotos, Comtesse de Nadaillac, Caroline Kuster, Innocente Pirola, Souvenir d'Elise Vardon, Anna Ollivier, Maréchal Niel, Souvenir d'un Ami, Madame Bravy, and Marie Van Houtte. T. B. Hall, Esq., was second, and Rev. J. Pemberton third. Both were very fine. Amongst the best trios in the second stand were Marie Van Houtte, Madame Lambard, Niphotos, Madame Margottin, Caroline Kuster, and Jean Ducher.

OPEN CLASSES.—For twelve single trusses of any Rose Mr. Frank Cant was first for a grand stand of Tea Souvenir d'Elise, which for size and condition could scarcely be excelled. Rev. F. Page Roberts was second with a splendid stand of Comtesse de Nadaillac, and Mr. B. R. Cant third with twelve magnificent blooms of Ulrich Brunner. Five other stands were staged, Madame Gabriel Luizet being very conspicuous. In the class for twelve trusses of any white Rose there were not less than twelve lots staged, nearly all of which were Merveille de Lyon, and splendid they were. Messrs. Curtis, Sanford & Co., Torquay, gained the premier position with a wonderful stand both in size and finish. Messrs. F. & A. Dickson and Son were second with the same variety, and Mr. George Prince, Oxford, third with a grand stand of Innocente Pirola. For twelve any yellow

variety Mr. F. Cant was well to the front with a grand stand of *Maréchal Niel*. Mr. Prince was second with a splendid stand of *Comtesse de Nadailac*, and the third fell to Messrs. Paul & Son, Cheshunt, for *Maréchal Niel*. For twelve of any crimson variety Messrs. Paul & Son were first with grand blooms of *A. Colomb*. Messrs. Cranston & Co. and Mr. J. House were second and third respectively, both staging *A. K. Williams*, but by no means in its best condition. For the best twelve dark velvety-crimson Messrs. Curtis, Sanford & Co. were first with a grand stand of *Abel Carrière*. Messrs. Paul & Son and B. R. Cant followed with *Abel Carrière* and *Prince Camille de Rohan*.

NEW ROSES.—For twelve varieties not in commerce previous to 1883, Messrs. Curtis, Sanford & Co. were first with excellent blooms of *Directeur Alphonse*, a fine crimson; *Madame Rambaux*, *Francisque Rivi*, Mrs. George Dickson, a fine pink; *Lord Bacon*, *Merveille de Lyon*, *Baron N. de Rothschild*, *Madame Delleranx*, *Alphonse Soupert*, a rich scarlet-crimson; *President Senelar*, black-crimson, very fine; *Mdlle. Julie Gaulain*, and *Souvenir de Gambetta*. The second fell to Messrs. Paul & Son, Cheshunt, with the following, in addition to some like the last: *Pride of Reigate*, splashed and shaded; *Ella Gordon*, *M. Benoit*, *Comte*, *Queen of Queens*, *Victor Hugo*, *Madame de Watteville*, *Eclair*, grand deep crimson; and *Longfellow*. Mr. Henry Frettingham was third.

SUTTON.

I KNOW of no Society which better deserves success than that of Sutton situated as it is in a district by no means favourable to Rose-growing, for, the soil is light, and in such seasons as we have experienced during the last two years it is especially difficult to get good flowers. It has, nevertheless, set itself to do the best that it could to remedy these defects. Not only does it prepare a liberal schedule, inviting persons from all parts to compete, but in its annual reports it is always trying to give such information as may be useful to its members, one year giving very clear and detailed directions as to growing, in another giving the valuable list of winning Roses prepared by Mr. Mawley, giving lectures and advice to all who might be interested in the growth, and all this pain and trouble is at last bearing fruit. I am aware that the Committee have been despondent as to the result of their labours, and have at one time been tempted to think that they have spent their strength for nought; but no one comparing the exhibits (I mean the local ones) with those of four years ago when the Society was started could fail to see the vast improvement that had taken place not only in the quality of the flowers exhibited, but in the manner in which they were set up, and if some of the exhibitors could only be persuaded to use Mr. Foster's tubes and stands they would still further increase the efficiency of the shows. Roses laid down on the moss without foliage do not show half as well as when wired and standing up well above the stand. The Committee are encouraged by their past success still to go forward, and purpose next year holding it in the open air under a tent, believing thereby they will attract a larger number of visitors. A good band is almost thrown away in such a room as the Show is held in, and if fine weather can be secured no doubt it will be a vast improvement. As usual the bouquets, hanging baskets, &c., were excellent, and most of them in very good taste, while many grand stands of Roses were shown.

In Class 1, twenty-four varieties, Mr. A. Slaughter, who this year has quite recovered the ground he lost last season, showed a remarkably fine stand, containing *Madame Marie Rady* (a very grand flower), *François Michelin*, *A. K. Williams*, *Baroness Rothschild*, *Camille Bernardin*, *La France*, *Marie Baumann*, *Etienne Levet*, *Madame Isaac Pereire*, *Madame Victor Verdier*, *Duchesse de Vallombrosa*, *Ferdinand de Lesseps*, *Anna Ollivier*, *Madame Gabriel Luizet*, *Belle Lyonnaise*, *Louis Van Houtte*, *Catherine Mermet* (a very grand bloom), *Dupuy Jamain*, *Emilie Hausberg*, *Jean Ducher* (very fine), *Mdlle. Marie Cointet*, *John Stuart Mill*, and *Alba Rosea*. Mr. T. W. Girdlestone was second, Mr. E. M. Bethune third, and Mr. H. Pawle fourth. In Class 2, for twelve varieties, Mr. Slaughter was again first with a beautiful stand, consisting of *Marie Rady*, *Baroness Rothschild*, *Ferdinand de Lesseps*, *Etienne Levet*, *Madame Gabriel Luizet*, *Auguste Rigotard*, *Belle Lyonnaise*, *A. K. Williams*, *Marie Baumann*, *John Stuart Mill* (very fine), and *Marie Finger*. The Rev. A. C. Hales was second, Mr. E. M. Bethune third. In Class 3, eight varieties, three of each, Mr. Slaughter was again first with *La France*, *Alfred Colomb*, *Innocente Pirola*, *E. Y. Teas*, *Anna Ollivier*, *Louis Van Houtte*, *Belle Lyonnaise*, and *Marie Rady*. Mr. F. C. Prince was second, and Mr. R. Cox Hales third. In Class 4, for twelve Teas, the first prize was awarded to T. W. Girdlestone, Esq., for a very good stand, consisting of *Souvenir d'un Ami*, *Madame Caroline Kuster*, *Catherine Mermet*, *Madame Margottin*, *Niphetos*, *Souvenir d'Elise Vardon*, *Belle Lyonnaise*, *Rubens*, *Comtesse de Nadailac*, *Madame Bravy*, *Marie Van Houtte*, and *Innocente Pirola*. Mr. A. Slaughter second, and Mr. E. M. Bethune third. In Class 5, for nine varieties, the first prize was awarded to Mr. E. Wilkins, the active Secretary of the Society, for a fine stand containing *Madame Clemence Joigneaux*, *Duke of Teck*, *Star of Waltham*, *Marie Rady*, *Charles Lefebvre*, *Camille Bernardin*, *Marquise de Castellane*, *Merveille de Lyon*, and *Louis Van Houtte*. Mr. E. C. Cuthell second, Rev. A. Cheales third, and Rev. W. Walker fourth. In Class 6, for six varieties, Mr. E. Williams was again first with fine blooms of *Alfred Colomb*, *Duke of Edinburgh*, *Marquise de Castellane*, *Star of Waltham*, *Charles Lefebvre*, and *Horace Vernet*. Rev. Alan Charles second, Rev. W. Williams third, and Mr. G. A. Mantell fourth. In Class 7, four varieties, three of each, Mr. E. Wilkins was again first with *Star of Waltham*, *Marie Rady*, *La France*, and *Charles Lefebvre*. In Class 8, for six Teas, Mr. E. C. Cuthell was first with *Jules Finger*, *Alba Rosea*, *Anna Ollivier*, *Souvenir d'Elise Vardon*, *Jean Ducher*, and *Maréchal Niel*. In Class 9, for twelve blooms of any one variety, Mr. A. Slaughter was again first with *Marie Baumann*. In Class 10, for twelve varieties of new Roses not sent into commerce before 1882, Mr. T. W. Girdlestone was first with *Duchesse de Connaught*, *Grace Darling*, *Comtesse de Paris*, *Violette Bouyer*, *Heinrich Schultheis*, *White Baroness*, *Queen of Queens*, *Merveille de Lyon*, *Ulrich Brunner*, *Lady Mary Fitzwilliam*, and *Etoile de Lyon*. In the local classes, in Class 11, for twelve varieties, Mr. G. Foster was first with *La France*, *Souvenir d'un Ami*, *Duke of Edinburgh*, *White Baroness*, *Paul Neyron*, *Alfred Colomb*, *Helen Paul*, *Sir Garnet Wolseley*, *Etienne Levet*, *Charles Lefebvre*, *Baroness Rothschild*, and *Prince Camille de Rohan*. In Class 12, for nine varieties, Mr. J. S. House was first with

Madame Gabriel Luizet, *Comtesse d'Oxford*, *Merveille de Lyon*, *Marie Rady*, *Capitaine Christy*, *Star of Waltham*, *Louis Van Houtte*, *Marie Baumann*, and *Etienne Levet*. In Class 13, for three Teas, Mr. G. Plenwell was first with *Madame Berard*, *Homère*, and *Wm. A. Richardson*. In Class 14, for three varieties, Mr. W. J. Hughes was first with *Capitaine Christy*, *Jules Margottin*, and *Duke of Edinburgh*. In Class 15, for six of any one Rose, Mr. J. Waterer was first with *Marie Baumann*; and in Class 16, in which the ladies' challenge cup was the first, it fell to Mr. H. Barrett, and as this is the second time that he has won it in succession it remains with him. The varieties were *Marie Baumann*, *Madame Gabriel Luizet*, *Dr. Andry*, *Marquise de Castellane*, *Comtesse d'Oxford*, *Alfred Colomb*.

Sutton always comes out strong in decorations, and this year was no exception to the rule. One very interesting class was that of a basket of Roses arranged by children. There were some very pretty ones shown, the first prize being awarded to Miss Cuthell, the second to Miss Dart, and the third to Miss Mary Hughes. In table decorations the first prize was awarded to Mrs. Loche, the second to Miss Guthridge, the third to Mrs. Morton, and the fourth to Mrs. Atkins. These all laboured under the disadvantage of not having sufficient space allotted to them to show them off. In the baskets for Roses Miss Shaw was first, Mr. Cuthell second, Mrs. Dart third, and Mrs. Guthridge fourth. In hanging basket Miss G. Shaw was first, Mrs. Tate second, Mrs. Ernest Wilkins third, and Miss Guthridge fourth. In hand bouquet Mrs. E. Wilkins was first, Mrs. E. Locke second, and Miss Ethel Hereward third. In the spray for ladies' dress Miss Shaw was first, Mrs. Ernest Wilkins second, Miss G. Shaw third, and Miss Easterweir third.

The Sutton Society offers prizes for nurserymen, and they were sufficient to bring together in competition Mr. Cant, Messrs. Paul & Son, Mr. Turner, and Mr. House. In the class for thirty-six, distinct, Mr. B. R. Cant was first, Messrs. Paul & Son second, Mr. J. House third, and Mr. C. Turner fourth. In the class for twelve Teas Mr. B. R. Cant was again first, Messrs. Paul & Son second, Mr. G. W. Piper third, and Mr. C. Turner fourth. I regret that I had not time to get the names of the winning flowers in the first-prize stand. Altogether the Sutton Rose Society may be congratulated on its success—an earnest, let us hope, of future good days.—D., Deal.

HEREFORD AND WEST OF ENGLAND.—JULY 9TH.

THIS highly popular Exhibition which next year will have reached its second decade of existence was held as usual in the Shire Hall, Hereford. The same atmospheric causes which introduced so many coarse and exceptionally small blooms into an exhibition hall this season doubtless militated against the usual competition by the large nurserymen at Hereford, Messrs. Keynes & Co. alone competing among the leading professionals for the open classes from which Herefordshire excludes herself.

As might be supposed Messrs. Cranston & Co. carried off the chief prizes. Their seventy-two single varieties embracing many highly meritorious blooms, *H.P. François Michelin*, *Louis Van Houtte*, *Alphonse Soupert*, new and a real acquisition; *Dupuy Jamain*, *Comtesse de Serenye*, *Dr. Andry*, *Madame Rothschild*, *Beauty of Waltham*, *Madame Gabriel Luizet*, *Mrs. Charles Wood*, grand; *Madame Marie Cointet*, *Général Jacqueminot*, fine; *Merveille de Lyon*, superb everywhere; *Constantin Tretiakoff* (Tea), *Catherine Mermet*, *Marie Baumann*, *Madame Catherine Soupert*, *Madame Etienne Levet*, *Madame Montet*, exquisite; *Senateur Vaise*, *Marie Verdier*, useful; *Marie Rady*, *Mons. Noman*, *Reynolds Hole*, fine in colour; *Marquise de Castellane*, *Ernest Prince*, *Edouard Morren*, *Louis Dore* (Tea), *Maréchal Niel*, *Vicomtesse de Vigier*, *Capitaine Christy*, *Sultan of Zanzibar*, *Victor Verdier*, *Tatiana Oneguine*, *Marguerite de St. Amand*, fine; *A. K. Williams*, shapely; *Madame J. Perriere*, new and promising; *Mdlle. la Marquise d'Hervey*, fine; *Abel Carrière*, *Ulrich Brunner*, grand; *Princess Beatrice*, *Prince Arthur*, *La France*, *Mrs. Baker*, *Pride of Waltham*, *Sir Garnet Wolseley*, *Lælia*, *Camille Bernardin*, *François Levet*, *Mary Pochin*, *Marquise de Mortemart*, *Duke of Edinburgh*, *Devienne Lamy*, *Miss Hassard*, splendid; *Antoine Ducher* (Tea), *Madame Bravy*, *Mdlle. Gabriel Tournier*, *Princess Mary of Cambridge*, *M. S. Delaplace*, *Madame Hippolyte Jamain*, fine; *Earl of Pembroke*, *Madame Georges Swartz*, *Comtesse de Paris*, *Madame Julia Dymonier*, *Duchess of Connaught*, *Henrich Schultheis*, fine, a real acquisition (Tea); *Jean Ducher*, *Nardy Frères*, *M. Eugène Deloux*, *Annie Laxton*, and *Le Havre*; Messrs. Keynes, Williams & Co., *Salisbury*, and Mr. George Davison, Hereford, taking equal second prize. This home firm also carried away the thirty-six trusses first prize, and for twenty-four singles first prize; Messrs. Keynes, Williams and Co., second prize thirty-six varieties; Mr. Davison, third prize; Messrs. Stephen Treseder, Cardiff, second prize twenty-four varieties; Messrs. Jeffries & Son, Cirencester, first prize eighteen varieties three trusses; Mr. H. Frettingham, Boston, Notts, second prize; Mr. Ralph Crossling, Penarth, third prize.

Class A 2 (open to nurserymen not residing in Herefordshire, seventy-two varieties single trusses).—£10, Messrs. Keynes, Williams & Co., first prize; £5, Mr. H. Frettingham, second prize.

Amateurs showed in greater force than their professional brethren, and their exhibits were far more level, smoother, and evenly sized. This contrast especially holds good of Mr. Grant's exhibits, which swept the prize-board, and deservedly so, even to winning the open class in Teas and Noisettes. In this rising exhibitor's grand stand of thirty-six single varieties were included *H. P.'s*, *Mrs. Baker*, bright; *Madame Gabriel Luizet*, charming everywhere; *Comte Raimbaud*, *François Michelin*, *A. K. Williams*, premier amateur bloom; *Miss Hassard*, as very seldom shown; *Constantin Tretiakoff*, superb; *Merveille de Lyon* (or of any other town, Lyon or not); *Marie Rady*, *E. Morren*, *Etienne Levet*, grand; *Hippolyte Jamain*, *Marie Finger*, *Prince Arthur*, *La France*, *Louis Van Houtte*, seldom seen lately; *Mons. Noman*, fine; *Comtesse d'Oxford*, grand; *Marquise de Castellane*, *C. Lefebvre*, *Marquise de St. Amand*, *Marie Baumann*, *Madame Montet*, superbly delicate; *Xavier Olibo*, *Le Havre*, *Marie Contet*, *Mrs. Jowitt*, *Ulrich Brunner*, grand; *Tea Climbing Devoniensis*, *Reynolds Hole*, grand colour; *Tea Souvenir d'Elise*, *Général Jacqueminot*, *Tea Niphetos*, only bloom in exhibition; *Charles Darwin*, useful; *Star of Waltham*. Second prize, Mr. T. B. Hall, Rockferry, near Liverpool. Third prize, Mr. J. H. Arkwright, Hampton Court, Leominster.

Class D (open to the United Kingdom, collection of new Roses, sent out by English nurserymen, and not in commerce previous to 1882).—This

useful and interesting class, as usual, was not shown as the public ought to see it, several blooms of the same variety being incomparably better than in the different collections.

Messrs. Cranston & Co. took first prize with the following highly promising reliable varieties in their collection:—H.P.'s, Alphonse Soupert; Lord Bacon, useful in colour, shape, and substance; Henrich Schultheis, large and good; and the incomparable light Merveille de Lyon, which variety also won for Messrs. Cranston & Co. the first prize for twenty-four blooms of any one Rose, Mr. H. Frettingham also winning second with Marie Baumann. Mr. J. H. Arkwright showed (not for competition) a useful box of garden Roses.

In the decorative division the Marquis of Bute's prizes were keenly contested. Indeed, this branch of the Society is annually growing in public favour, and doubtless helps not a little in keeping up the interest of the general public—an important feature in the management of all societies in these fashion-shifting days.

The Judges over the nurserymen's division were the Rev. C. H. Bulmer, Credenhill Rectory, Hereford, and Mr. H. J. Grant, Hope End, Ledbury. Amateur Classes—Mr. Williams and Mr. Birch, Salisbury Nurseries; and Mr. Corey, Cirencester Nurseries.—HEREFORDSHIRE INCUMBENT.

SHROPSHIRE ROSE SOCIETY.

JULY 9TH.

FAVOURÉD with excellent weather this Society held its Show in a large tent in the old quarry grounds at Shrewsbury. The exhibits on the whole were satisfactory, especially those staged by the nurserymen. The premier class for seventy-two varieties only brought two competitors into the field, the Cranston Nursery Company, Hereford, taking the lead with magnificent blooms. Messrs. Perkins & Sons, Coventry, who followed, showed some very fine blooms, notably one of Mr. Cant's new Tea variety, Madame de Watteville, a very charming kind, which richly shaded and tipped rich rose-red, of excellent form. The amateurs' classes were pretty well filled, but there were many of the exhibits without merit; many of the flowers were badly coloured and small, while an equal number were past their best. Some of the collections from gentlemen's gardeners in the district were very good. Special mention may be made of the stand of twelve Xavier Olibo shown by Messrs. Jas. Dickson & Sons, Newton Nurseries, Chester. The colour and form were perfect, and they well merited the equal award with Messrs. Cranston & Co.'s excellent stand of Merveille de Lyon.

The tent was very well filled, although the miscellaneous exhibits, usually so important at such shows, were not numerous. We noticed, however, some fine boxes of Roses staged by Messrs. James Dickson & Sons, Chester, and the Cranston Nursery Company, Hereford. A very excellent stand of Pink Mrs. Sinkins, arranged with another which we took to be Admiral Marsden, mixed with some fine flowers of *Cistus formosus*; this was shown by Mrs. Clarke, The Rocks, Meole. Messrs. Jones & Son, nurserymen, Shrewsbury, staged a huge collection of the usual decorative plants, as well as numerous stands of hardy herbaceous flowers, white Water Lilies, &c., which were very attractive; but we could not help noticing the great want of some elegant plants to supplement and materially assist the excellent display of Roses, which certainly did great credit to the energetic Secretary, Mr. Jones, and others who assisted him, and we trust the Society will receive ample support, so as to be able to extend its usefulness.

CLASSES OPEN TO ALL.—The principal one in this section was for seventy-two varieties, single trusses, in which there were two collections staged by Messrs. Cranston & Co., Hereford, and Messrs. Perkin & Son, Coventry. Both were meritorious, but the Hereford stands had the advantage in colour and freshness; the Coventry flowers were very large, but too far gone. Messrs. Cranston & Co. received first honours, the splendid blooms consisting of the following varieties:—Back row.—La France, a splendid bloom; Louis Van Houtte, Charlotte de la Tremonille, Mdlle. Catherine Soupert, John Stuart Mill, excellent; Ulrich Brunner fils, Mdlle. Eugénie Verdier, very fine; Tatiana Onegine, Charles Lefebvre, Comtesse de Serenye, excellent; Alfred Colomb, Madame Montet, Marie Baumann, La Duchesse de Morry, Duke of Edinburgh, unusually good; Duchesse de Vallombrosa, Mons. Alfred Dumesnil, Mons. Noman, Victor Verdier, Barthélemy Joubert, Lady Mary Fitzwilliam, Exposition de Brie, Madame Hippolyte Jamain, and Dr. Andry, splendid. Middle row.—Prince Arthnr, Etoile de Lyon, Countess of Rosebery, Merveille de Lyon, grand; A. K. Williams, Star of Waltham, Madame Lacharme, magnificent; Beauty of Waltham, Sultan of Zanzibar, unusually good; Madame Marie Cointet, Comte de Paris, Madame Ferdinand Jamain, Xavier Olibo, Countess Pembroke, Madame la Marquise d'Hervey, Elie Morel, magnificent; Dupuy Jamain, Pride of Waltham, Nardy Frères, Mary Pochin, a splendid bloom; Edouard Morren, Richard Laxton, and May Quennel. Front row.—Ernest Prince, Dingee Conard, fine; Peach Blossom, Général Jacqueminot, Constantin Tretiakoff, Jules Touvais, Mdlle. Marie Rady, excellent; Marquise de Castellane, Madame Gabriel Luizet, splendid; Le Havre, fine; Horace Vernet; Marquise de Mortemart, Madame Charles Wood, an immense even bloom; Lælia, Mons. E. Y. Teas, Mdlle. Marie Verdier, Queen of Waltham, Madame Ducher, Marie Van Houtte, Mrs. Baker, a magnificent bloom; Dr. Savell, Madame Thérèse Levett, and Duke of Connaught. The finest blooms in the Coventry collection were Madame Sophie Fropot, Alphonse Soupert, Edward Morren, unusually good; Madame de Watteville, a splendid Tea; François Michelin, Mons. E. Y. Teas, Marquise de Castellane, Beauty of Waltham, and Madame M. Rady, very large and good. Messrs. Cranston were again first for thirty-six varieties, although nearly equal honours were shared by Messrs. James Dickson & Sons, Newton Nurseries, Chester, the adjudication being rather difficult in this case; and Perkins & Son were third. The premier collection included some most magnificent blooms. Back row.—La France, Madame Marie Rady, Marie Finger, Prince Arthnr, Duchesse de Vallombrosa, Dr. Savell, Pride of Waltham, Dingee Conard, Victor Verdier, Lady Mary Fitzwilliam, splendid; A. K. Williams, and Merveille de Lyon. Middle row.—Mons. A. Dumesnil, Madame Lacharme, very large; La Rosière, excellent; Rosy Morn, Beauty of Waltham, Madame Marie Cointet, Dupuy Jamain, Marquise de Castellane, Général Jacqueminot, Ernest Prince, Madame Gabriel Luizet, and Sénateur Vaisse. Front row.—Madame Charles Wood, superb; Ulrich Brunner fils, Peach Blossom, Louis Van Houtte, Barthélemy Joubert, Marie Baumann, Mons. Noman,

Alfred Colomb, Mons. Montet, Xaxier Olibo, l'Esperance, and Comtesse de Serenye. Messrs. Dickson & Sons' blooms were superb, the following being particularly good:—Madame Gabriel Luizet, Baroness Rothschild, Madame Montet, Etienne Levett, Marie Baumann, La France, Etoile de Lyon, Sénateur Vaisse, splendid; Captain Christy, and Elie Morel. Messrs. Cranston again took the lead with eighteen varieties of Teas, followed by Perkins and Sons, Coventry, and Mr. G. Townshend, Uffington. None of the flowers were really first-rate, but the following in the leading collection are noteworthy:—Homère, Madame Bravy, Comtesse de Nadailac, Comtesse Riza du Parc, and Mary Van Houtte. In the class for twelve of any one variety Messrs. James Dickson & Sons, Chester, and Messrs. Cranston shared equal honours, two first prizes being awarded. The first exhibitor staged perfect blooms of Xavier Olibo which, for colour and finish, could scarcely be excelled. The other stand was Merveille de Lyon, a very fine lot of that popular variety.

In the classes provided for gentlemen's gardeners in the county of Salop, the first prize for twenty-four varieties fell to Mr. G. H. Colin, Ashford Court, for a very excellent stand, with Emily Laxton, Madame Lacharme, grand; Général Jacqueminot, Maréchal Niel, Marie Baumann, Baroness Rothschild, Dr. Andry, Le Havre, Avocat Duviervier, Duke of Edinburgh. Dupuy Jamain, La France, Exposition de Brie, Beauty of Waltham, Souvenir de Malmaison, Captain Christy, Annie Wood, Louis Van Houtte, Duke of Teck, Victor Verdier, Auguste Rigotard, Star of Waltham, and Mrs. Baker, a splendid bloom. Mr. Milner, gardener to Rev. J. D. Corbett, Sundorne Castle, was second with an excellent stand, and Mr. West, Halston, third. Two other collections were staged. In the corresponding class for twelve varieties, the same exhibitors were first and second respectively, and Mr. Lambert, gardener to Col. Wingfield, third. Mr. Colin's stand was again very fine, especially the following—Baroness Rothschild, Marie Baumann, Victor Verdier, and Duke of Edinburgh.

AMATEUR CLASSES OPEN TO ALL.—Three stands of twenty-four varieties were staged, the first falling to G. Bourlay, Esq., Quarry Place, Shrewsbury; third, Mr. Lloyd, Cherry Orchard, Shrewsbury; the second being withheld. The following were very fine in the leading stand—Dupuy Jamain, Merveille de Lyon, excellent; La France, Mons. Noman, and Charles Lefebvre. For twelve varieties there were five lots staged; the awards were given in the following order—Dr. Roberts Welshpool, Mr. G. Townsend, jun., Uffington, and Mr. G. Bourlay. The leading stand were very fine, consisting of the following—Madame Gabriel Luizet, a splendid bloom; A. K. Williams, first class; Etienne Levett, Charles Lefebvre, Duke of Edinburgh, Duchesse de Vallombrosa, Général Jacqueminot, Louis Van Houtte, Maréchal Niel, Prince Camille de Rohan, Belle Lyonnaise, and Mdlle. Eugénie Verdier.

TEA AND NOISSETTE VARIETIES.—For twelve varieties open to anyone in the county, Mr. G. Townsend was well to the front with a charming stand, including Jean Ducher, Belle Lyonnaise, grand; Niphotos, very fine; Maréchal Niel, A. Olliver, Madame C. Kuster, Bouquet d'Or, Rubens, splendid; Celine Forestier, Madame Denis, Madame Lambard, and Madame Bravy. Mr. E. W. Pritchard and Col. Wingfield were second and third respectively.

CLASSES FOR AMATEURS WITHIN FIFTEEN MILES OF SHREWSBURY.—Mr. Pryce Evans, Uffington, was first for eighteen varieties with a very fair stand; the best blooms were Etienne Levett, Captain Christy, Alfred Colomb, Sénateur Vaisse very good, and Belle Lyonnaise. Mr. Gurnett was a good second. The first for nine blooms fell to Mr. Townsend, whose stand was excellent; Marquise de Castellane, La France, Dr. Andry, Madame C. Kuster, and Madame Noman, were superb. For a stand of six the first prize was awarded to Mr. J. Giddens, Bicton, for large and perfect blooms of Constantin Tretiakoff, Charles Lefebvre, La France, A. K. Williams, Jean Pouret, and Devonienis; the second and third fell to Mr. H. Brown, Wyle Cop, and Mr. Pryce Evans respectively.

STRAWBERRIES.—There were five collections of three dishes each staged, all of which were excellent; the first fell to Jones & Son, Shrewsbury, for two dishes of President, and one Elton Pine, all of which were extremely good. Mr. Milner, gardener to Rev. J. D. Corbett, was second, and equal thirds were awarded to Miss Sellar, Kingsland, and Mr. H. Hughes, Ganis Lodge.

JACOB'S LADDERS.

THIS genus, though containing few species, includes none unworthy of a place even in the most limited collection. The synonymy in this, as with many other popular genera, has been sadly mixed, and the consequent confusion is not by any means agreeable to the cultivator. All the species may be grown with ease in ordinary garden soil, giving little or no trouble when once thoroughly established. They are increased either by seed, which ripens well in this country, or by division of the roots, which may be accomplished in the autumn. Others are Polemonium reptans, a creeping-rooted species with large blue flowers, useful for the rockery; *P. mexicanum*, moschatum, and humile.

P. cœruleum, perhaps the commonest and best known of all the Greek Valerians, is generally found in large clumps, and even rows, in many of the old-fashioned cottage gardens. Even in our more modern gardens hardly a border can be seen without its patches of blue and white Valerian, and healthy plants in a strong loam are amongst the finest sights at the present time. It is also used very effectively in the wild garden, where it soon establishes itself provided the ground be kept free from rank weeds so as to allow the self-sown seedlings plenty of light and space. It forms large masses in the course of a few years, which are ever attractive in or out of flower. There are other forms grown under various names, notably *P. sibiricum*, which is distinct from *P. cœruleum* only in having bipinnate leaves instead of the ordinary pinnate of the type. *P. pulchellum* differs little from *cœruleum*; it has much smaller

flowers, and is a less useful garden plant; a variety from the Himalayas called *grandiflorum*, with flowers half as large again as the ordinary form, it is well worthy a place, and should be included in all collections of

broad sense, include *speciosum* and *lanatum* or *villosum*. It grows generally about half a foot high, throwing up numerous much-branched panicles of vivid purplish blue flowers. The leaves are mostly radical, the

Fig. 8.—*POLEMONIUM RICHARDSONI*.

showy plants; it does best in partial shade, thriving well on an eastern aspect. Natives of Europe, generally flowering June, July, and August.

P. pulcherrimum, nearly allied to *P. richardsoni*, and may, in a

leaflets oval shaped, blunt, and hairless, in which it differs distinctly from the following, as well as in having smaller flowers. It is perfectly hardy in sunny spots of the rockery, and during the months of June and July

flowers profusely. It was introduced from the Rocky Mountains by Mr. Drummond.

P. Richardsoni, shown in the illustration, fig. 8, was named in honour of the celebrated Arctic explorer, Dr. Richardson, who found it growing near Great Bear Lake about the year 1826. The general appearance of its flowers reminds us much of our common *P. coeruleum*, and in the "Linn. Transact," 14, p. 377, it was quoted as a variety under the name of *P. coeruleum* var. *nanum*, Hook, from specimens gathered by Captain Sabine in Spitzbergen. For all garden purposes, however, its neat dwarf habit well entitles it to specific distinction, incorporating in one plant, as it were, the large flowers of the common Jacob's Ladder with the neat habit of the foregoing. It is an extremely valuable plant for rockery decoration in the late summer and autumn months when well established, which it readily does in well-drained sunny positions, it forms quite a pleasing feature. It throws up angular hairy stems, branched almost from the base; leaves pinnate; leaflets more round than oval, quite downy underneath; the flowers are pale purple, thickly marked with deeper coloured lines. It flowers July and October.

The illustration was prepared from a specimen furnished us by Mr. T. S. Ware of Tottenham, who has shown the plant extremely well at Kensington this year, and was awarded a first-class certificate for it a short time since.—M. S.

GOOSEBERRY AND CURRANT TREES.

HAVING read the timely remarks of your correspondent, Mr. Bardney, respecting the spring stopping of the Gooseberry and Currant trees, I was in hopes he would have gone farther and treated the subject more fully as to the training and the protecting from birds. I agree with him as to stopping the lateral shoots, but I leave the point, as if that is stopped they throw more lateral growths and weaken the buds for next year's fruit.

I have read of a gentleman saying he always had to preserve his fruits twice before he could eat them. If we wish to have a good supply and good fruits of Gooseberries and Currants we must preserve them five times before we eat them. First we have to preserve the buds from the birds in the winter; second, the bloom from frost, beetles, &c.; third, the leaves from insects, caterpillars; and fourth, the fruit from birds, bees, wasps, and then grit splashed by the rain, &c.

To guard against all these, and to save time and trouble in watching and stopping them, I would propose to train them either as single specimens or on a trellis or espalier. The trellis I would recommend would be a double one, in the form of the letter V, from 4 to 6 feet high, and planted each side and trained from 6 to 8 inches apart upright. By so doing they could easily be protected from birds, frosts, &c., by putting a net or mats over them, and while growing they would be readily stopped, examined, and thinned for kitchen use. The leaves infested with caterpillars can be picked off before they have left the leaf the eggs are deposited on.

If grown as single trees they should be trained in shape of a teacup or goblet, and the centre kept open to allow the air to get to them and the sun to ripen the buds for next year's crop. Carefully protect the buds from the birds by netting them in winter and early spring; also from frost, and watch and pick the caterpillars off before they spread over the tree. Thin the fruit as soon as large enough for bottling green or for the kitchen, and stop all lateral growths not required for training up the wires. Fork the ground, dusting once or twice with lime or soot, and mulching well with good manure in the winter, watering the trees in the growing season with liquid manure. We should then soon hear less about the trees not bearing or being without leaves, and there would be no more complaints from the cook about having no Gooseberries or Currants for preserving.—G. E., Warwickshire.

GREENHOUSE PLANTS.

HYDRANGEA THOMAS HOGG.—I scarcely know a finer plant than this for a cool greenhouse. Easily managed, if well fed producing large trusses of white flowers, which look distinct; and visitors say, "What is that?" It is so delightful to have plants in greenhouse and garden anent which visitors have to interrogate. If this plant is well fed it thrives remarkably, for my plant is in a small 48-pot, and it has three good trusses of flowers, and not more than 1 foot high. I can imagine how fine a large specimen would look in many of our greenhouses and conservatories, but we seldom see it. I am sure many an amateur would find this an excellent plant to grow for greenhouses without any artificial heat.

HYACINTHUS CANDICANS.—Some bulbs of this noble "jacinth" were potted up pretty early and stood in the greenhouse, and they have been in excellent condition. Some of the spikes are forwarder than others, but on the whole they present a very unique and effective appearance; the bold foliage, tall spikes of white waxy-looking bells, so pure under glass that they may be used for any purpose. The stamens are not so conspicuous under glass as outside. I think it is Mr. Kelway of Langport who strongly recommends this plant for forcing. Well done, Mr. Kelway, but I rather regret your advice is not followed in half as many instances as it might be with the greatest advantage and best results.

WEIGELA HORTENSIS NIVEA is just going past, and I am sorry to lose so sweet and chaste a flower, but it has done admirably. The small bushes in 7-inch pots have been covered with pretty trusses of pure white Mock Orange-like blossoms, which, though rather thin in texture, are nevertheless extremely useful and effective when cut, especially for vase decoration. It is just coming into flower outside, and looks very neat, and a capital shrub for a border. I was told the other day that the demand for this plant is greatly on the increase for forcing; and well it may be, for when once grown it will, I should imagine, always be employed.

OXALIS LACTIFLORA.—A pretty little Sorrel, with deep green leaves and numerous milky white flowers about the size of a shilling. Dwarf and spreading, indeed slightly trailing in habit, I wish to recommend it for fringing the margins of the side stage, grown in pots or pans. Its habit is so suitable that it may be most effectively used for this purpose with *Isolepis* and *Selaginella Kraussiana* or other plants. It affords a striking contrast to most other plants useful for that purpose, while its own pretty white flowers springing from a bed of deep green are extremely effective. I feel quite sure it is a plant which would please the majority of flower-lovers.

LITTONIA KEETII.—This is a very handsome and interesting plant, climbing by means of tendrils at the ends of the leaves, similar to what occurs in *Gloriosa superba*—a close relation, by the way. The flowers are solitary from the axils of the leaves, bell-shaped, with lanceolate divisions, of a clear orange colour, and lasting a long time in its pure beauty, and by the appearance of the growing shoots there are a large number of flowers to develop, so we will enjoy the pretty though not gorgeous flowers for some time. For training round a pillar it is an excellent plant, or a small trellis can be arranged in the pot, but it certainly looks best the other way. It requires good drainage and a free rich soil of fibrous peat, loam, leaf soil, and sand in equal proportions. I am not sure whether this is distinct from the older *L. modesta*.

FORCED LILIUMS.—I use the term "forced" because my plants have really been slightly stimulated, as the kinds now mentioned are not in flower out of doors yet. First there is the old Madonna Lily—*L. candidum*—than which none are sweeter and purer. The bulbs were potted in September and stood in a cold frame until the roots were well in action, when they were carried to the greenhouse, and the first flowers opened early in June. So much admired have they been that many good friends say they will attempt their culture in this direction in future, and no doubt they will succeed equally well, providing of course good strong bulbs are had to start with. *L. eximium* and *Harrisi* are also in flower with their large trumpet-shaped pure white perianths, sweetly scented, and right noble in appearance; they are kinds which must come to the front for greenhouse decoration. The brilliant little *L. tenuifolium* is just over, but its intense scarlet turbans have been much admired. *L. auratum* will speedily open some of its great buds to the June sunlight, and truly it is the "queen of Lilies," and one need not be without flowers of it from this time till at least the end of October if small lots of bulbs are bought at different times during the importing season. According to my experience much has been written of little value anent the root-action of this Lily. I have seen an abundance of stem roots, and encouraged them to the fullest extent, even though there have been incontestably fine bulbs well furnished with roots at the base. There is no doubt stem roots are produced in Japan. I have repeatedly removed them from amongst the scales of imported bulbs as their shirts of clay were cleared off; and last year I examined some insignificant home-grown examples, some measuring 18 inches round, with plenty of basal roots, and the base of the stem was matted with other roots.

THE NEW ZEALAND CLEMATIS (C. indivisalobata).—This gave us quite a wealth of white flowers very early in the year, is now growing luxuriantly. Last season's wood has been removed and the young put in its place. The plant is receiving plenty of liquid manure—real good stuff in my opinion; it is stable drainage, and evidently the plant likes it. Those possessing this Clematis should bear in mind the necessity of securing strong wood every season, for from the current growth next season's flowers will be produced. No cool greenhouse should be without this extremely floriferous and handsome flower.

DIPLACUS GLUTINOSUS is an old plant in our gardens, not quite hardy, but very suitable for a cool house. Shrubby at the base, it flowers freely from the young growth, producing orange Mimulus-like blossoms for a considerable time, and as easily managed as a Zonal Pelargonium. There is nothing very showy about this plant; nevertheless, it is one which is honestly worth growing.—T.

HORTICULTURAL SHOWS.

WIMBLEDON.—JULY 8TH.

AN admirably arranged schedule, comprising upwards of eighty classes, with special prizes in no less than thirty-one additional classes, a beautiful position—the grounds of Mrs. Schuster, Carnizaro House—a district of good gardeners and active amateurs, Wimbledon ought to produce a good show. The Exhibition, which can only have brief notice, was held in three marquees, and beyond doubt every one contained products eminently worthy of inspection. The specimen plants were not of elephantine dimensions, but the majority were well grown. Ferns were particularly good, Roses and other cut flowers both numerous and attractive, fruit excellent, and vegetables very satisfactory. The groups of plants arranged for effect commanded primary attention in the large tent. In the open-to-all class, the arrangement occupying 100 square feet, the first prize was won by Mr. Wilkinson, gardener to Mrs. Schuster, with a well balanced assortment of healthy examples, vigorous spikes of *Gladiolus brecheleyensis* rising effectively above Palms, *Caladiums*, &c., while the margin was par

ticularly good, being composed of alternate plants of Gloxinias and Adiantums in first-class condition. Mr. Smith, gardener to J. F. Schwan, Esq., Oakfield, was an excellent second with a tastefully arranged and cheerful group, in which Paris Daisies were conspicuous, the margin being composed of *Panicum variegatum* and *Lobelias*. In the smaller groups, Messrs. Davies, gardener to W. Chafer, Esq.; Bridger, gardener to L. Walters, Esq.; and Bentley, gardener to Sir Thomas Gabriel, Bart., were the successful exhibitors in the order named. The first prize group was perhaps a trifle dull, but the plants were in first-rate order and well arranged; the second was almost a bouquet of flowers, relief being wanted; the third, an informal, almost rugged arrangement, yet decidedly pleasing. Very beautiful groups, not for competition, were arranged by Messrs. Thomson, Wimbledon Nurseries; Jackson, Kingston; and Laing & Co., Forest Hill. The groups above mentioned made in themselves an interesting and attractive exhibition.

Noticeable in the plant classes were *Caladiums* from Mr. Law, gardener to R. S. Dean, Esq., splendid examples, 3 feet in diameter, in 8-inch pots, closely followed by Mr. Bridger. *Achimenes* of the same dimensions secured the first prize for Mr. Smith, Oakfield, who was followed by Messrs. Law and Wilkinson. Mr. H. Alderman, gardener to G. Hatfield, Esq., Morden Hall, staged splendid *Coleuses*, almost perfect globes, 3 feet in diameter, in 6-inch pots. Mr. Wilkinson followed with well coloured pyramids. In the class for four specimen plants Messrs. Bentley and Smith were the successful exhibitors, the former staging a *Clerodendron*, *Croton*, *Dracæna*, and *Pandanus*, all good. The same cultivators were respectively first and second in the single specimen plant class with admirable examples of *Clerodendron Balfourianum*. Mr. Bentley secured the first prize for *Gloxinias*, one plant having about sixty flowers. Mr. Newell, gardener to S. E. Sanders, Esq., Fairlawn, staged *Tuberous Begonias* of superior quality, receiving both the Society's prize and the special, J. Caswell, Esq., following creditably. Messrs. Bentley and Bridger secured the prizes for Ferns with admirably grown specimens, and Mr. Law had the best *Petunias* and *Pelargoniums*, Mr. Legg contributing a first-rate group of the latter in 5-inch pots, not for competition.

The cut flower tent was wonderfully well occupied, both *Roses* and herbaceous plants being splendidly represented, and the competition exceedingly close. Two silver cups were offered—namely, in an open class for twenty-four blooms and a Wimbledon amateurs' class for twelve blooms. Messrs. Cheal & Son, Crawley, secured the first, and J. A. Coleby, Esq., the second, Mr. Moorman losing in the open class by one point, and had the collection been judged last in the tent instead of first he would certainly have won, as his blooms being young improved, while the others quickly expanded. Mr. Moorman was, however, still the premier exhibitor, staging more fine blooms in the classes than anyone else, Mr. Coleby sharing the honours with him. They were equal first in another special class for twelve blooms, Mr. Moorman winning the Society's chief prize for the same number, also the first prize for triplets. Mr. Coleby was first with six H.P. blooms, and also for the same number of Teas. Messrs. Northover, Hunter, Templeman, and Walsh were successful exhibitors in the *Rose* classes. Messrs. James Veitch & Sons had a magnificent display not for competition, the blooms being equal to those staged at the great shows; their box of *Rosa lucida* attracted much attention. It is probably the most floriferous *Rose* in existence, and is sure to be in great demand for bouquets and vase-decoration on account of its extraordinary clusters of small flowers and buds. Messrs. Cheal secured the first prize for hardy cut flowers with a wonderfully fine collection, a double yellow *Helianthemum* being extremely effective, and must be a first-rate rockery plant. Messrs. Smith and Law were the remaining prizetakers with stands of great excellence, and a remarkably fine group not for competition was contributed by Mr. D. S. Thomson. Exhibits in the smaller classes were good, but cannot be particularised.

The display of fruit was not extensive but very good indeed—except, perhaps, *Melons*, which were defective in flavour. For a collection of six dishes Mr. Gibson, gardener to J. Wormald, Esq., Morden Park, was first with first-rate black and white *Grapes*, a fairly good *Melon*, and capital dishes of *Strawberries*, *Cherries*, and *White Currants*. Mr. Alderman, gardener to C. Czarnikow, Esq., Mitcham, was an exceedingly close second, and would perhaps have been first had his *Gooseberries* been ripe, the third prize falling to Mr. Davis, gardener to Rev. F. Morris, Roehampton, for a very creditable collection. Messrs. Gibson, Davis, and Bentley were awarded the prizes in the order named for Black Hamburg *Grapes*, all staging well. In the class for white *Grapes* Mr. Gibson was first with very fine *Muscats*; Mr. Alderman, Mitcham, second with first-rate bunches of *Foster's Seedling*; and Mr. Bentley third with *Buckland Sweetwater* of excellent quality. The brothers Alderman and Mr. Smith secured the prizes for *Peaches*, which were very good and close in point of merit; and Alderman (Mitcham), Wilkinson, and Smith were the successful exhibitors of *Strawberries*. All that can be said about the vegetables is that they were a credit to the cultivators of them and the Show. The Exhibition was admirably managed by the earnest and able Secretary, Mr. H. A. Rolt, and his industrious coadjutors, and the Society merits a large share of public support.

LEE, BLACKHEATH, AND LEWISHAM SHOW.

The eighteenth annual Exhibition of the above-named Society was held on July 8th and 9th, by kind permission of Mrs. Penn, in a field adjoining the charming gardens of The Cedars, Lee. The Show was in every way a marked success, the weather being most favourable on both of the two days, thus inducing a great number of persons to visit the Show, especially on the second day. In previous years it has unfortunately been wet on one or both of the days, and last year the Society suffered a great loss in consequence. The success this year has, however, been so great as to place the Society on a prosperous footing again. Great praise is due to the indefatigable exertions of the esteemed Treasurer (F. H. Hart, Esq.), and Secretary (Mr. C. Helmer), who certainly did their utmost to render the Show a success. The Society's exhibitions are deservedly increasing in popularity every year, and will in time develop into a first-class suburban show.

The exhibits in the various classes were generally of great merit, being remarkable for excellence of culture. The whole of the classes were well contested, the entries being numerous except in Class 1, which had only two competitors, and which was for eight stove or greenhouse plants in flower,

open to gentlemen's gardeners only. Mr. Reece, gardener to R. Whyte, Esq., Pentland House, Lee, was first with admirably grown and flowered specimens of *Dracophyllum gracile*, *Ixora Williamsi*, *Erica geminifera*, *Phenocoma prolifera Barnesi*, and *Erica Cavendishiana*; Mr. Sharpe, gardener to F. Hatchett, Esq., being second. In Class 2, for six plants of ornamental foliage, Mr. S. Reece was first, Mr. J. Lambert second, and Mr. Sharpe third. For six show *Pelargoniums* distinct, Mr. Reece was first with well-bloomed plants of *Illuminator* and *Sensation*; and with *Zonal Pelargoniums* Messrs. Reece, Martin, and Jeffery were the prizetakers. Mr. S. Reece was also first in the Fern class with well-grown plants of *Davallia Mooreana* and *Cibotium Scheidei* and others. For four *Lycopodiums* Mr. J. Lambert was first, Mr. Sharpe second, and Mr. Hudd third. Six *Caladiums* distinct—this class was well contested, the first prize going to Mr. Sharpe with sturdy and beautifully coloured plants, among which *cardinale* and *candidum* were very conspicuous; Mr. Martin, gardener to A. English, Esq., being second, with good plants of Dr. Lindley and Louis Duplessis; and Mr. Reece third. In the class for six Cape Heaths, Class 9, there was only one exhibitor, Mr. Reece, whose plants, however, were of first-class quality. In other classes the prize were taken by Mr. Hudd, Mr. Rhoden, Mr. Sholdice, Mr. Garland, Mr. Sharpe (gardener to F. Hatchett, Esq.), Mr. Reece, Mr. Mullins, Mr. Jeffery, Mr. Sharpe, Mr. J. Lambert, and Mr. Luff (gardener to — Hyatt, Esq., Streatham).

In the classes for cut flowers the entries were numerous, especially for *Roses*. In Class A for forty-eight single blooms (open) Messrs. Bunyard and Co. of Maidstone were awarded first for a splendid box of blooms. Especially fine were the blooms of *Abel Carrière*, *Madame Lacharme*, *Innocente Pirola*, *Duke of Teck*, *Madame Victor Verdier*, *Laurette*, *Duchesse de Vallombrosa*, *Madame Ferdinand Jamain*, *Madame Bravy*, and *Merville de Lyon*. Mr. J. W. Todman, The Nurseries, Eltham, coming in second with scarcely less inferior blooms, *Niphetos*, Dr. Andry, and *La France* being remarkably fine; and Messrs. John Laing & Co. of Forest Hill third. In Class B for twenty-four single blooms (open), Messrs. Bunyard & Co. were again first with good blooms of *Star of Waltham* and *Jean Ducher*, Messrs. Laing being second, and Mr. Harris third. Class C, twelve single blooms, open to gardeners and amateurs, Mr. Harris first with well formed flowers, notably so being *Baroness Rothschild* and *Marie Baumann*; Mr. Hemnade second, and F. Hatchett, Esq., third. In the class for a stand of cut flowers for dinner-table, Mr. Lambert was first with a very pretty and tasteful arrangement, Mr. Greenfield second, and Miss Buttenshaw third. With three stands of cut flowers for dinner-table Mr. Lambert first, Mr. Nunn second, and Miss Dent third. For a box of cut flowers arranged for effect, exhibitor's own growing, in Class F, the first prize went to Mr. Rhoden, second Mr. Mullins, and third Mr. Shrubbs. For hand bouquets Mr. Kellsall, Mr. C. Boatright, and Mr. Shrubbs were the prizetakers.

For the classes devoted to fruit there was a keen competition. The *Grapes* shown were of average quality. In Class A A Mr. Shrubbs was awarded first for a collection of six dishes. For three bunches of black *Grapes* Mr. Jeffery first, Wright second, Cole third, and Hudd fourth. Three bunches of white *Grapes*, first Mr. Jeffery, second Mr. Wright, and third Mr. Sholdice. Single bunch of black *Grapes*, Mr. Feeley first, Wright second, and Cole third. In other classes Messrs. Garland, Hudd, Shrubbs, Holden, Sharpe, Boatright, Cole, Nunn, and Greenfield were the prizetakers.

The vegetable classes are not so well represented as they ought to be, but what was shown was of good quality, Messrs. Jeffery, Rhoden, and Nunn taking the leading prizes.

A silver Memorial cup is offered every year to the winner of the greatest amount of prize money. The cup remains in the custody of the winner's employer for the year, the gardener having for permanent possession a silver medal showing him to be the winner. Mr. S. Reece, gardener to R. White, Esq., is again the fortunate winner of this coveted prize, he having won it for three consecutive years.

ROYAL CALEDONIAN SUMMER SHOW.

THIS Show was held on the 8th and 9th inst. in the Waverley Market, Edinburgh. The amount of produce, judging by the appearance of the tables, being much smaller than we remember to have seen it. This may have arisen partly from the absence of the nurserymen's competition in the main plant classes; Messrs. R. B. Laird & Sons for instance being the only competitors in the class for a table of plants. *Roses* were good, though many of the flowers were rather past the first flush of beauty. *Grapes* were also a good show, and of *Orchids* there was a table of fine plants.

The chief class for gardeners was that for a table of plants 20 feet by 5 feet. For this Mr. R. Grossart, gardener to Mr. Buchanan, Oswald Road, was first, and Mr. C. Smith, gardener to Mr. Wilson, Restalrig House, second. Neither arrangement showed anything remarkable. For six stove or greenhouse plants in flower, Mr. J. Patterson, Millbank, was easily first, a noticeable plant being *Erica ventricosa Bothwelliana*. A good *E. Vernoni* was the only other specimen calling for remark. Mr. G. McLure, Trinity Grove, was second, and Mr. Bald, Canaan House, third. The class for three like plants brought out nothing above mediocrity, Mr. Scott, Carbery Tower, taking the first place. Mr. Patterson was the sole exhibitor of four Cape Heaths, *E. Paxtoni* being good. Foliage plants were small. For six Mr. Scott was first and Mr. Grossart second; while for three Mr. G. Wilkins, Canonmills Lodge, was first, and Mr. Patterson second. A few *Caladiums*, *Crotons*, and *Dracænas* were exhibited.

For four *Orchids* Mr. J. Currer, gardener to G. Douglas, Esq., Eskbank, was first, his chief plant being a *Cattleya gigas* with thirteen flowers. Mr. Grossart was second, showing a good *Odontoglossum vexillarium*, and a two-spiked *Vanda suavis*, and a good specimen of *Dendrobium suavisimum*. For two plants Mr. McLeod, Brentham Park, Stirling, was first, his chief plant being a *Cattleya regalis* with fourteen fresh highly coloured flowers. Mr. McIntyre, The Glen, Peebles, second. Mr. Grossart had the best single specimen, and Mr. McLeod the second. Ferns were in no case large, but they were fresh, the first prize for four exotics going to Mr. McKinnon, Melville Castle. Mr. Johnston, Woolmet, staged the best three *Adiantums*. British Ferns were better represented than their exotic brethren; the first prize for these going to Mr. Cumming, St. Rognie, who also took first for dwarf species.

Mr. Paterson, gardener to R. Dundas, Esq., Polton House, Lisswade, had

the best twelve Alpine plants in flower, these being extremely pretty. The kinds staged were *Campanula pentagonia*, *C. fragilis hirsuta*, *C. pumila alba*, *C. turbinata*, *C. t. Dicksoni*, *Saxifraga ceratophylla*, *S. aizoides aurantiaca*, very novel; *Primula floribunda*, *Dianthus alpinus*, *Statice miniata* (?), *Lysimachia nummularia*, and *Sedum glaucum*.

ROSES.—The Roses, as we have said, presented a most attractive feature. In the nurserymen's classes the competition lay mainly between the Irish grower, Mr. H. Dickson of Belfast, and the Scotch grower, Mr. Smith, Stranraer, the Irish Roses beating the other most completely. For forty-eight, twenty-four, twenty-four Teas, twelve trusses, twelve sent out since 1882, twelve *Maréchal Niel*, twelve *Lady Mary Fitzwilliam*, twelve *Duke of Edinburgh*, twelve *Baroness Rothschild*, twelve *Mons. E. Y. Teas*, twelve *Sir Garnet Wolseley*, and twelve *Gloire de Dijon*, the Irish Roses were first. Mr. Bryson, Helensburgh, had the best collection of Roses, and Mr. Dickson second.

Some of the finer blooms in the prize lots were of Teas, *Lady M. Fitzwilliam*, *Etoile de Lyon*, *Maréchal Niel*, *Anna Ollivier*, *Catherine Mermet*, *Innocente Pirola*, and *Etendard de Jeanne d'Arc*; these were generally small. Of the H.P.'s the following were shown in good form: *Star of Waltham*, *La France*, *Merveille de Lyon*, *Etienne Levet*, *Alphonse Souperet*, *Souvenir de Léon Gambetta*, *A. K. Williams*, and *Merveille de Lyon*.

In the gardeners' classes there was a strong competition, but the blooms were much smaller and generally more overblown than in the trade classes. For thirty-six blooms Mr. Parlange, gardener to H. Dennistowne, Esq., Golfhill, Roslin, was first, many of the blooms being fine, large, and bright in colour. The second prize went to Mr. McColl, gardener to M. A. Murs, Esq., Ardenrohr, Row, and the third to Mr. G. Hunter, gardener to Mr. MacKnight, Lauriston Castle. Seven competitors staged in this class. For twenty-four blooms Mr. Parlange was first again, Mr. McColl second, and Mr. Dow, gardener to Sir David Baird, Newbyth, third. For twelve trusses Mr. Parlange was again first; Mr. A. McIntosh, gardener to Col. Milne Home, Paxton, Berwickshire, second. Mr. W. Matthews, gardener to T. R. Ure, Esq., Moua Cottage, Bonnybridge, had first for six blooms. Prizes were offered for several blooms of distinct varieties, but in no case were these fine. For twelve Tea Roses Mr. Hill Gray, Dunkeld, took first with a lot of fresh beautiful buds, though small; two magnificent buds of *Maréchal Niel*, however, were large and finely coloured. Mr. Parlange had the second prize for these. For six Teas Mr. McColl was first, and Mr. Scott, Carbery Towers, second.

For twenty-four cut trusses, stove or greenhouse plants, Messrs. Ireland and Thomson were first, Messrs. Dickson & Co. second. The latter firm had also first prize for bedding *Violas* and show and fancy *Pansies*. In the gardeners' section for twelve trusses stove or greenhouse plants Mr. Smith, Brentham Park, Stirling, was first, showing some beautiful *Orchids*, fine spathes of *Anthurium Schertzerianum*, and a *Pancratium*. Mr. R. Corkbury, gardener to H. H. Norie, E-q., Coltbridge Hall, second, and Mr. Grossart third. For twelve *Pinks* Mr. Parlange was first, as also for fancy *Pansies*, Mr. Ritchie, Denny, being first for show *Pansies*.

FRUIT.—With exception of the Grapes fruit was in scanty quantity. Mr. Johnstone, Glamis Castle, was the only exhibitor of a collection of fruit, in this case only four dishes being staged instead of eight as required in the schedule. This comprised two splendid bunches of *Black Hamburg* Grapes, excellent *Brown Turkey* Figs, *Sulhamstead Peaches*, and a *Best-of-All Melon*. A special award was voted to these. For a *Pine Apple* Mr. Morrison, Archerfield, Drem, was first, and Mr. McKelvie, Brotmouth Park, Dunbar, second. Mr. Murray, gardener to Marquis of Ailsa, Culzean Castle, had a special vote for seven *Pine Apples*. For four bunches of Grapes five lots were staged, the first prize going to Mr. J. W. Mackenzie, gardener to the Marquis of Lothian, Newbattle Abbey, Dalkeith, the two bunches of *Muscat of Alexandria* being very fine, the other two bunches being fine *Black Hamburgs*; Mr. J. Hacker, gardener to J. More Nisbett, Esq., The Drum, Liberton, second; and Mr. Bald, gardener to J. McFarlane, Esq., Oswald Road, third. Five pairs of *Black Hamburgs* were staged, the first prize going to Mr. Boyd, gardener to W. Forbes, Esq., Callander Park, Falkirk, for examples of super-excellent quality, large in bunch and berry and perfect in finish; Mr. McKinnon, Melville Castle, was second with two remarkably fine bunches. For two bunches of black of another kind Mr. Bald was first with two small but well-finished examples, seemingly of Mrs. Pince; Mr. Kerr, Sunlaws, Kelso, second. For two bunches of *Muscat of Alexandria* Mr. Morrison, Archerfield, was first with good well-ripened examples; Mr. R. Dunlop, gardener to J. Addie, Esq., View Park, Uddingston, second, with better though less ripe Grapes. For six *Peaches* Mr. Machattie was first with fine *Early York*; Mr. Cockburn, Coltbridge Hall, second with *Hales' Early*. For six *Nectarines* Mr. Smith, Oxenford Castle, was first with fine *Violette Hative*, and Mr. Machattie second with *Lord Napier*, large and fine, but rather overripe. For six *Figs* Mr. McIntyre, The Glen, was first with *Brown Turkey*, and Mr. Young, Taymouth, second. Mr. McKelvie was first for a *Melon*, and Mr. Boyd second. Mr. Melville, St. Boswells, was first for a dish of *Cherries*. Mr. Sinclair, Prestonkirk, had first prize for four dishes of *Strawberries* and a single dish of the same fruit.

Bouquets.—Mr. P. Walker, Hope Park, Bonnybridge, for table bouquets had first prize; Mr. J. Cocker, Wheatlands House, Bonnybridge, being second. For two hand bouquets Mr. Cocker had first, and Mr. Bowman second.

Vegetables were almost without exception of poor quality. For a collection of twelve sorts, open to market gardeners, Mr. Logan, Coldstream, was first, and Mr. Miles, Sunnybank, second. For eight kinds, open to gardeners, Mr. Potter, Seaciff, North Berwick, was first, and Mr. Bowman second. Mr. John Stewart, Catherine Bank House, was first for a collection of salads, and Mr. Milne second. None of the single dishes were of a character worth noting.

Of miscellaneous exhibits Messrs. Methven & Sons, Messrs. Ireland and Thomson, and Messrs. Dickson & Co. each showed mixed tables of stove and greenhouse plants. Mr. R. Munro had a collection of alpine and herbaceous plants. Messrs. J. Lamont & Sons showed a large collection of named English and Spanish Irises, Alpine Poppies, and Herbaceous *Pæonies*. Messrs. Dickson & Co. staged an extensive assortment of cut flowers, including a large number of border *Pinks*, laced *Pinks*, and a pure white variety, Mrs. W. M. Welsh, to which a first-class certificate was awarded. Some fine Fancy and Show *Pansies* were also staged by this

firm. From Messrs. Stuart & Mein, Kelso, came a new white *Lobelia*, Miss Hope, which may prove useful for greenhouses, also a large collection of cut *Pyrethrums* and *Pinks*, *Delphiniums* and herbaceous plants.

Among garden requirements were a few greenhouses, one from Messrs. Mackenzie & Moncur, Upper Grove Place, Edinburgh, fitted with their toothed ventilating gearing, which saves the ventilators from any bad effects of high wind. The outside was painted a chocolate colour picked out with gold, the finials and ridge ornamentation of bronze, making a very effective example of artistic greenhouse building. Messrs. Keith & Hardie, Edinburgh, showed a conservatory, the main feature of which was the strengthening of the rafters with flat iron strap running the entire length of the roof.

OXALIS CERNUA.

In the very pretty genus *Oxalis* we have an extensive assemblage of plants of so interesting a character, that it cannot but excite surprise that of more than 100 species known to botanists, so few should be seen in general cultivation. The habit of the whole is remarkably neat and dwarf, their colours comprise nearly every imaginable shade, and the simplicity of their culture is such that the veriest novice can hardly fail in their successful treatment. A few only of the species are perfectly hardy, but a considerable number may be grown in the open borders during the summer and autumn; of many, however, the flowers are produced at so early a season of the year that they are chiefly cultivated in pots, for which all of them are admirably suited, and it is from this section of the genus that our illustration is taken.

The *Oxalis cernua* possesses in a high degree the qualifications we have attributed to the whole genus; its flowers are of the purest yellow

Fig. 9.—*Oxalis cernua*.

of a delicious Jasmine-like fragrance, and produced in greater abundance than in any other species of our acquaintance. On a bright sunny morning a pot of this plant will present up to noon a perfect blaze of beauty; but, as in the case of the rest of the genus, its flowers remain closed in cloudy weather, or where no direct sunshine penetrates.

As in most of the other species the root is a small bulb, from which arises a very short underground stem or stipe, to which the leaf-stalks are articulated. The leaflets, sprinkled with russet brown spots, are so broadly heart-shaped that they may be termed two-lobed, which, with its many-flowered umbel, serves to distinguish it among the stemless species. While young the leaflets are at the approach of evening folded back against the petiole, expanding with the return of the morning light; but the older leaves appear to lose gradually this sensibility to the solar radiations, and remain folded under all circumstances.

The umbel of flowers, consisting of eight to twelve blossoms, sometimes more, is supported on a smooth peduncle, or, to speak more correctly, scape, 6 or 8 inches long; and as each bulb throws up at least half a dozen scapes in succession, the flowering season of the plant may be fairly said to extend over a period of two months.

Cultivation.—After blooming the plants should be exposed in a sunny corner out of doors, water being gradually withheld. By degrees the leaves will assume a yellow tint, and finally fall off; and in this condition the pots containing the bulbs should be placed aside and kept perfectly dry until the season arrives for repotting them. If the ball of earth be now examined, a strong fibre may be traced from the surface-bulb quite to the bottom of the pot, and usually terminated by a cluster of young bulbs, each of the size of a nut. A pot planted originally with three bulbs will often contain, after flowering, a dozen or more full-sized roots, so that abundant facilities are offered for its propagation. At the base of the old bulb, which perishes, and also upon the short stipe proceeding from it, small offsets are often produced; but they are too minute to be

available for the ready increase of the plant. At the end of September, about which time the roots will begin to grow, they may be repotted in sandy loam, with a little peat or leaf mould, planting them, if large, singly in a 4-inch pot about an inch below the surface; but it is preferable to place from three to five or six bulbs in one of rather larger diameter, a good drainage of potsherds or fragments of charcoal being indispensable. If the weather is mild the pots may remain in a warm nook out of doors, due precaution being taken to protect the plants from those pests of the gardener—slugs, snails, and worms; but on the approach of frosts they should be removed either to a cold frame, or, in the absence of this, to a cool window of south aspect, where plenty of air can be admitted in mild weather. A dry hot atmosphere is injurious to the plant; it should, therefore, be grown at a comparatively low temperature, and be removed to the sitting-room only when about to flower. If potted at the period named it usually begins to blossom about the end of March; but this depends in some degree on the temperature in which it has been kept. If the roots were preserved in a dry state until January or February, we think it highly probable that they might be planted in the open borders with the protection of a handlight, and would then flower in May and June, but without this covering it would be imprudent to risk the bulbs. The treatment of all the winter and spring-flowering species may be assimilated to that of the *O. cernua*.

Our plant is not a recent introduction, having been brought as long since as the year 1767 from the Cape of Good Hope, of which country nearly one-half the species are natives. The trivial name of the plant is by no means distinctive, for there are many species the flowers of which droop before expansion; nor is the term more applicable to the leaves.—W. T.

SEASONABLE HARDY FLOWERS.

COMPARATIVELY few are aware of the numbers of hardy herbaceous and bulbous plants which produce flowers at this season, and having before me a charming series of these plants I have thought a few words respecting them may not be out of place. I may remark that it would prove a great help to those desirous of making selections of hardy plants for planting later, on were they to pay occasional visits to nurseries where these plants abound, and make notes of the best in flower at each visit, with date, height, and predominant colour. By so doing a much better idea can be formed of the real value of these plants, together with their requirements. Descriptions are very well, but in many cases they fail to convey an adequate idea of the plants, and to see living specimens in groups impresses one with the effect which can be produced with such things when they are judiciously arranged, for in many instances the effect has been marred by an insufficient knowledge of the plants themselves.

LILIES.

Prominent among the noble race of *Liliums* is the true *L. pomponium*, a native of the south of Europe. This attains a height of about 3 feet, and having fine spikes of rich fiery scarlet flowers, at first sight not unlike those of the scarlet *L. Martagon*, an old acquaintance we meet still occasionally in cottage gardens in fine clumps. This very effective species delights in a rich, loamy, well-drained soil; and here I may observe that it must not be confounded with *L. pyrenaicum rubrum*, which has often been supplied as the plant in question. They are very distinct, however, the one under notice being far superior. Then I take a glance at the lovely flowers of *L. Washingtonianum*, truly a grand Lily. This is seldom seen above 4 or 5 feet high, but when well established in favoured situations in peaty or light loamy soils it will grow fully 6 feet high. Its delightfully fragrant flowers are sometimes white, in others delicate lilac, and are sometimes spotted; and then there is the variety *purpureum*, which is also very fine, this is spotted with black. Next I observe the soft apricot and orange-shaded flowers of *elegans alutaceum*, only a foot high, grand for pots, and one of the most telling and distinct, and near akin is *elegans sanguineum*. This has fine reddish-crimson orange-shaded flowers, and is one of the largest and earliest of this section. Next comes *L. pardalinum pumilum*, of somewhat slender growth, with flowers of a deep orange and densely spotted; and lastly, among Lilies which are now before me, is *L. colchicum*, a Lily of noble bearing, powerful in its fragrance, and one of the most lovely and graceful of its race. The flowers before me are a clear golden yellow. It is, however, somewhat variable in this respect, as I find in an old memorandum some few years since I had several distinct forms of this charming plant. The flowers are very substantial and much reflexed. It grows 3 or 4 feet high, and delights in a rich well-drained loam; sometimes the flowers are primrose and more or less covered with dark spots.

CALOCHORTI.

How lovely, still somewhat quaint, are the flowers of *Calochorti* and *Cyclobothra*, but how seldom seen. Did they but

inhabit tropical climes, and extortionate prices demanded for them, we may see them more frequently. Can it be that they are not sufficiently known? It must be, for their elegance and somewhat novel form of some are sure to call forth admiration from those who first behold them. *C. albus*, *cæruleus*, *pulchellus*, *Leichtlini*, are among the best, and a fine flower of *venustus*, nearly the size of an ordinary Tulip, has large erect white blossoms, heavily blotched with purple at the base; the dense bearding of some forms is also a very distinct feature among these exquisite plants.

POPPIES.

In three colours I have *Papaver nudicaule*—namely, white, golden yellow, and deep orange, thus forming a trio of highly attractive and decorative plants at this time. These form compact tufts about a foot high, and are among the freest flowering plants of my acquaintance. For the rockery or front row in the border they are charming, and, being so easily reproduced from seed, will take care of themselves, and I am of opinion that they may with telling effect be used on old ruins and the like.

MISCELLANEOUS.

Geum coccineum plenum, a showy scarlet flower, is highly attractive and very useful. The same may be said of the *Armerias* or *Thrift*, which are very useful as cut flowers. *Triteleia laxa* has large showy heads of purple flowers, very pleasing and effective, and a valuable hardy bulbous plant. Among the *Alliums* I may mention *A. flavum* and *A. ciliatum*, the former a pleasing yellow, and the latter small pure white flowers exceedingly good and useful. *Cypripediums* are represented by *C. spectabile* and *C. acaule*, both well known plants, and *Irises* are too numerous to give in detail, all good and beautiful, and among the most chaste of hardy plants. Among the English section are some of the most lovely, in which *Mont Blanc* figures as a splendid white. Every conceivable shade of colour may be found among these, and the *germanica* group, both of which are unparalleled in beauty; indeed nothing can compare with them among hardy plants, and even among tropical Orchids they take no second-class place. Very fine somewhat pyramidal heads of pure white flowers are those of *Ornithogalum latifolium*, snowy in their whiteness, and a very ornamental hardy bulbous plant. *Pyrethrum parthenium fl.-pl.* produces small double white flowers in great numbers and is a very useful plant about 18 inches high. It becomes whiter after it has been in a room for some days.

Last, but not least, among hardy plants at present is *Henckera sanguinea*, one of the loveliest introductions for many years. It is not only the most exquisite member of its genus, but one of the most beautiful rock plants yet introduced. It is thus described in Mr. Ware's list, "It thrives in the open air without any care, a fact which bodes well for its future prosperity. It forms a neat compact tuft of deep cordate leaves, five to seven-lobed, and these again sharply crenated, of a light green, and slightly hairy; the flower stems are slender, 12 to 15 inches high, covered with bright crimson flowers." There is no doubt that so lovely a plant will meet many admirers. The individual flowers are not unlike drooping bells of a bright coral red.—E. JENKINS.

ROYAL HORTICULTURAL SOCIETY.

JULY 14TH.

THOUGH the exhibitions at Kensington are so frequent they continue to increase in interest, and that held on Tuesday last was distinguished by the diversity and quality of the contributions from numerous competitors, especially in the fruit and vegetable classes. The plants, except as regards the groups, were not of a remarkable character, and were, in fact, rather disappointing, but the occasion was signalised by the extraordinary group of *Odontoglossum vexillarium* from Mr. Hardy, which caused as great a sensation as the *Ascott Carnations* at the Rose Show last week. The entries in the twenty-six classes provided in the schedule, the non-competing collections, and the contributions before the Fruit and Floral Committees, filled all the available space in the conservatory, forming a highly satisfactory and varied display.

FRUIT.

Until this Show a really good exhibition of fruit had not been witnessed in London this season, and even this proved rather early for some exhibitors who usually take prominent positions in the more important classes. This weakness was chiefly apparent in the white Grapes, most of which were slightly wanting in ripeness, and amongst the black Grapes several bunches were noticeable that would have been greatly improved by hanging a week or two longer on the Vines. Peaches and Nectarines were much better than might have been expected, and in some instances were exceedingly fine. Pine Apples, Melons, Strawberries, Figs, and Cherries were all well represented. A superb collection of Peaches, Nectarines, and Cherries from Messrs. T. Rivers & Son, Sawbridgeworth, was greatly admired, and the silver-gilt medal awarded for it was a well-merited honour, for the fruits were the finest of their kinds in the whole Exhibition. The Cherries were particularly grand, and one dish of Early Rivers contained some magnifi-

cent fruits such as have never been surpassed. Bigarreau Napoleon, Bigarreau Gros Coeuret, Bigarreau Noir de Guben, Bigarreau Monstrueuse de Mezel, and Turkey Black Heart were similarly handsome in size and colour, a small yellow-fruited variety named Couleur de Chair being curious and pretty. Some of the Peaches were extremely large, Conkling being very notable in that respect; Dr. Hogg was also of handsome appearance, and Golden Rathripe was both large and of a fine golden hue. Nectarines were admirably shown, and one, the beautiful golden Goldoni, was certificated; the very dark Spenser, with Darwin, Pine Apple, Byron, Humboldt, and Seedling No. 2 were all of extremely fine appearance and excited innumerable expressions of admiration from the crowds of visitors.

Grapes.—Eleven competitors staged their productions in the class for three bunches of Black Hamburgs, and, as might be expected amongst so many, there was much difference in the quality of the exhibits, some being slightly deficient in colour; but all were good in other respects, and the leading bunches were of considerable merit. Sir A. K. MacDonald, Bart., Woolmers, Liphook, Hants (gardener, Mr. Taverer), was awarded first honours for very handsome bunches of medium size, but with splendid berries superbly coloured and bearing a dense bloom. Thomas Barnes, Esq., The Quinta, Chirk (gardener, Mr. J. Loudon), took the second place with larger bunches but smaller berries equally as well coloured as the preceding. Mr. D. Roberts, Prestwold Hall Gardens, Loughborough, was third with good bunches and berries, but rather wanting in colour, and they appeared to have been somewhat rubbed in transit.

For three bunches of any other black variety, Messrs. Rothschild, Gunnersbury Park, Acton (gardener, Mr. J. Roberts), amongst seven exhibitors, were worthily accorded the premier prize, the variety being Madresfield Court, the bunches and berries of grand size and bearing a superb bloom, such as renders this variety so imposing. Mr. Roberts has given much attention to it, and finer examples than those referred to could not be desired, evident proof of his successful treatment. Lord Suffield, Gunton Park, Norwich (gardener, Mr. Allan), followed closely with the same variety, also most creditable in the size of bunch and berry, but not so well coloured as the first stand. Lord Carrington, Wycombe Abbey, Bucks (gardener, Mr. G. T. Miles), was third with three bunches of Gros Maroc weighing 6 lbs. 6 ozs., handsome bunches, the berries large and finely coloured.

Muscat of Alexandria was not generally so well represented as the black Grapes, but the three bunches for which W. H. Seville, Esq., Warren Hill, Loughton, Essex, was awarded chief honours, were remarkable in size, being solid and well formed, but the berries were of medium size and too green to be quite satisfactory. They were, however, such admirable examples of good culture in respect to the size that the Judges could not pass them for the better coloured bunches which gained the second prize, and though the decision caused some discussion and comment the general opinion was in the favour of the "large" bunches. Mr. J. Loudon followed with smaller but good bunches, the berries of medium size and fairly well coloured. Sir P. F. Rose, Bart., Rayners, Bucks (gardener, Mr. H. Cakebread), was third with rather green samples.

Peaches and Nectarines.—Eleven dishes of six Peaches were contributed, and some uncommonly fine fruits were included amongst them. Mr. R. Farrance, Chadwell Heath, Essex, was placed first with Barrington of great size and very handsome. Mr. Cakebread was second with Grosse Mignonne similarly fine, and J. Corlett, Esq., Chorlton House, East Sutton (gardener Mr. W. J. Bashford), was third for beautiful fruits of Crimson Galande. No less than sixteen dishes of Nectarines were staged, Mr. Bashford leading with Stanwick Elruge of fine colour and size. Mr. John Wallis, Keele Hall Gardens, Newcastle, was second with Lord Napier, handsomely coloured. Mr. Allan taking the third prize for Violette Hâtive, also admirable in size and colour.

Pine Apples.—Two classes were devoted to these, for a pair of fruits of one variety and a single fruit, nine competitors staging in the former class, and seven in the latter. Mr. D. Roberts had the best single fruit, Moscow Queen, a large handsomely developed fruit. Mr. R. Nicholson, Castle Hill Gardens, South Molton, gained the second honours with Smooth Cayenne, also large and of fine form, Mr. Loudon following with a slightly smaller Queen; but with the pair of fruits this exhibitor secured the chief prize for beautiful symmetrical well ripened Queens. Mr. T. C. Mundell, Moor Park Gardens, Rickmansworth, and H. J. Atkinson, Esq., Gunnersbury House, Acton (gardener Mr. Hudson), following with the same variety.

Strawberries.—To these two classes were also appropriated, and eleven exhibitors of two varieties competed. Mr. D. Roberts won the first place with British Queen and President, both large and well ripened, the latter being especially good. Mr. Allan secured the second prize for James Veitch and Crimson Queen, the last named of unusual size. Mr. J. Smith, High Street, Romford, was placed third for Dr. Hogg and British Queen, very few points inferior to the others. Amongst thirteen exhibitors of one variety, Mr. T. Eckington, Woodthorpe Grange, Nottingham, was the most successful, showing Sir Joseph Paxton in capital condition as regards size and colour. Mr. C. Waite followed with beautiful examples of British Queen, and Mr. Allan was third with Dr. Hogg, similarly fine. Other exhibitors had good examples of Eleanor, Sir Charles Napier, and Empress Eugénie.

Figs were shown by eight competitors, all very close in merit, and the prizes were won by Viscount Eversley, Heckfield (gardener, Mr. Wildsmith), Mr. Taverer, and Earl of Cork, Marston House, Frome (gardener, Mr. Iggulden), the variety in each case being Brown Turkey, differing slightly in size and ripeness.

Cherries were shown in excellent condition in the class for two varieties, of which seven lots were entered, Mr. Hudson leading with Black Circassian and Bigarreau Napoleon, both beautiful samples. Earl of Radnor, Longford Castle, Salisbury (gardener, Mr. Ward), was a close second with May Duke and Cleveland Bigarreau; and Mr. H. J. Goodacre, Elvaston Castle Gardens, Derby, was third with Black Circassian and Bigarreau Napoleon.

Ten pairs of Melons were staged, and the Marquis of Bath, Longleat, Warminster (gardener, Mr. Pratt), was adjudged first honours for handsome even fruits of the variety Longleat Perfection, recently certificated at Chiswick. Mr. Peter Goddard, Huxton Court Gardens, Maidstone, secured second honours with an unnamed scarlet-flesh variety, coarsely netted; and Mr. Wildsmith was third with Hero of Lockinge neatly netted and of medium size.

Prizes for Packing Fruit.—Messrs. Webber & Co., Covent Garden Market, offered three prizes for the best boxes of Peaches packed ready for market, which brought eight exhibitors, the awards being secured by Mr. Thomas Turton, Maiden Erleigh, Reading; Mr. Thomas Hare, Wellington, and Mr. Waterman, gardener to H. A. Brassey, Esq., Preston Hall, Aylesford. In each of these the system adopted was similar—namely, the Peaches were packed in single layers in boxes 4 to 5 inches deep, the individual fruits being wrapped in tissue paper and then packed firmly in moss. The fruit was in excellent condition, as fresh as if but just gathered. Some of the non-successful candidates had employed cotton wool, and one had used bran, but neither appeared so satisfactory as the moss and tissue paper.

VEGETABLES.

An excellent display of vegetables was provided, and it would be very difficult to obtain fourteen better or more even collections than those entered in the class for eight varieties, the closeness of the competition rendering it still more interesting. In another respect it was remarkable—namely, in the victory obtained by Mr. G. H. Richards, gardener to the Earl of Normanton, Somerley Park, Ringwood, Hants, who succeeded in defeating that redoubtable exhibitor, Mr. G. T. Miles, by several points. All the vegetables in Mr. Richards' premier collection were extremely fine, and they were, moreover, tastefully set up on Parsley, a point which always adds much to the appearance of a collection generally. The varieties shown were Daniels' White Elephant Onions, 5 to 6 inches in diameter, very even white and solid, superb examples; Lapstone Kidney Potatoes, clean, even, and handsome; Green Globe Artichokes, Canadian Wonder Beans, very fine pods; Perfection Tomatoes of medium size, but even and well ripened; Sanders' Marrow Pea, large well filled pods; Early London Cauliflowers, white, fresh, and excellent, heads of moderate size; and Sutton's Improved Intermediate Carrots, large and even samples. Mr. G. T. Miles had the following in the second prize collection:—Veitch's Pearl Cauliflower, a trifle too old and slightly brown; Asparagus, very fine; Sutton's Intermediate Carrots, good, but not quite so large as in the first; Snowdrop Potatoes, Stamfordian Tomatoes, very handsome; Culverwell's Green Marrow Peas, and Early White Naples Onions, very handsome. Mr. Miles gained a point with his Tomatoes, but he lost one with the Potatoes, the Cauliflowers, and the Onions; and preference was also given to the Beaus as compared with the Asparagus, as being a more seasonable dish. Mr. S. Haines, gardener to the Right Hon. Earl of Radnor, Colehill House, Highworth, was a good third, showing creditable examples of Autumn Giant Cauliflowers, Woodstock Kidney Potatoes, Trophy Tomatoes, large Green Globe Artichokes, Pen-y-Byd Marrows, White Leviathan Onions, Nantes Horn Carrots, and Duke of Albany Peas, good. Extra prizes were awarded to Mr. Thomas A. Beckett, Cole Hatch Farm, Bucks, and Mr. C. J. Waite, the former showing Fillingham Tomatoes and White Naples Onions, fine; the latter having Hackwood Park Tomatoes and White Leviathan Onions in excellent condition.

Tomatoes.—Eight dishes of very fine fruits were entered in the class for these, Mr. R. Farrance securing first honours with extremely large, even, highly coloured examples of Trophy Improved. Messrs. W. & E. Wells, Crosby Gardens, Hounslow, followed with Trophy, not quite so even, but large and handsome; Mr. R. Phillips, The Deodars, Meopham, taking the third place with Carter's Perfection Tomatoes, fine, solid, well-formed fruits of high colour.

Cucumbers.—A dozen brace of Cucumbers were staged in competition very close in merit. Mr. Goodacre was first with Telegraph, 20 inches long, even well-proportioned and handsome. Mr. Ward followed with Purley Park Hero, not quite so long but equally handsome, and Mr. Richards was third with the same variety a few points behind.

Special Prizes for Peas.—Messrs. E. Webb & Sons, Wordsley, Stourbridge, offered three prizes for the best twenty-four pods of their new Pea Wordsley Wonder, and the fourteen competitors all staged handsome examples. Mr. H. Marriott, Skirbeck, Mr. J. Cook, Boston Long Hedge, and Mr. H. Marriott, jun., securing the first, second, and third prizes. Mr. J. House, Peterborough, also offered three prizes for forty pods of his Perfect Marrow Pea, which brought eight competitors, the most successful being Messrs. H. Marriott, Cook, and Marriott, jun., all staging fine pods.

PLANTS AND FLOWERS.

The plants in competition were of an ordinary character, and, except those from Mr. Hudson, which were placed first in the classes for nine Crotons, nine Dracenas, and nine foliage plants, they do not call for special comment. Those named were, however, neat plants, both the Crotons and Dracenas being well coloured, while the foliage plants comprised a wonderfully large Asparagus plumosus. Mr. Luff and Mr. Chadwick secured the principal of the other prizes with small plants, Mr. C. J. Waite having the best six Coleuses. Mr. H. James, Castle Nursery, Lower Norwood, won the premier prize with Nepenthes, Sarracénias, and twelve foliage plants, staging specimens which we have repeatedly noticed before.

Cut flowers were much better, and the hardy flowers were admirably represented by three exhibitors. Mr. T. S. Ware, Tottenham, gained first honours for a collection of flowers, the numbers unrestricted, and, as usual, had a most beautiful exhibition, comprising a large number of the most effective varieties and species, amongst which Campanulas, Irises, Lilies, Delphiniums, Phloxes, Veronicas, and Aquilegias were predominant, the pretty yellow *Linum campanulatum*, the white *Papaver nudicaule album*, the very free and handsome *Lilium candidum speciosum*, the charming dwarf white *Campanula pumila alba*, and a finely coloured variety of *Lilium pardalinum* named *californicum* being especially notable of the others. Messrs. Paul & Son, Cheshunt, were placed second with a very meritorious and well arranged collection, comprising a selection of the most choice and handsome flowers, of which some of the most striking were *Bupthalmum cordifolium* and *salicifolium*, with large yellow heads of narrow florets; *Coreopsis grandifolia*, large golden yellow; *Centaurea macrocephala*, with globular heads of yellow flowers 3 inches in diameter, very effective; *Calliprora lutea*, wite neat yellow star-like flowers; and the bright scarlet *Geum coccineum plenum*. Mr. E. Morse, Epsom, was third, also with a good selection of useful and effective flowers, *Campanulas turbinata* and *carpatia alba* being very notable, with the graceful scarlet *Cbelone barbata* and a small white *Dianthus* named *Marie Paré*. For six *Lilium* spikes Mr. T. S.

Ware was also first, showing fine flowers in Browni, Martagon dalmaticum, extremely dark; testaceum, buff yellow; Humboldti, yellow with maroon spots; Parryi, bright yellow; and canadense rubrum. Messrs. Paul & Son followed, showing Browni, Parryi, Martagon, pardalinum, umbellatum, and Washingtonianum, the latter being especially pretty; and Mr. Quarterman, Cobham, Surrey, was third, his flowers of Liliun Harrisii being uncommonly fine. Mr. T. S. Ware was the only exhibitor of twelve Phloxes, gaining the first prize with large trusses of distinct and diversely coloured varieties.

MISCELLANEOUS.

The most remarkable of the non-competing group were the plants of *Odontoglossum vexillarium* from G. Hardy, Esq., Pickering Lodge, Timperley, Cheshire, which have already been incidentally referred to. Seventy plants were arranged with Ferns and small Palms, and formed an exceedingly beautiful group, which fully deserved the highest honour the Society could give—namely, a silver-gilt Banksian medal. The plants were all extremely healthy, and some very large ones having 300 flowers, and all were genuine specimens, none being made up. In all there were 1037 spikes, comprising probably over 5000 blooms, varying from pure white to the deepest rose, and it was astonishing to observe that though the plants had travelled so far, and the flowers are extremely delicate, not one appeared to be bruised in the slightest degree. Mr. Hardy deserves the highest praise both for the fine condition of the plants and the liberal spirit which induced him to send such a valuable collection of plants so long a distance.

Messrs. J. Veitch & Sons, Chelsea, were awarded a silver medal for a handsome collection of Rose blooms, nine boxes being staged, representing all the best varieties in capital condition, bright, fresh, and substantial. Very notable was a stand of *Rosa lucida*, Rose Button, a charming buttonhole Rose, very neat in the bud, and of a clear bright pink, being borne in dense trusses. It is an extremely floriferous and pretty variety, which should be grown by all who have to cut large quantities of flowers for bouquets, buttonholes, or decorative purposes generally. A similar award was also granted to Messrs. Lee & Son, Hammersmith, for a large collection of Rose blooms and a handsome group of variegated shrubs and trees, amongst which Ivies were particularly noteworthy, margined with dwarf Roses in pots. Bronze medals were awarded to Messrs. Kelway & Son, Langport, for an extensive collection of choice hardy flowers, several boxes of *Gaillardias* being extremely bright amongst them; and to Mr. T. A. Beckett for a collection of well-grown vegetables, comprising very fine Leviathan Beans, the pods 12 to 14 inches long, some good Lettuces, and Moore's Cream Vegetable Marrows very neat and even.

A silver medal was awarded to Messrs. J. Carter & Co., High Holborn, for an extensive collection of Peas, including sixty dishes of about the same number of varieties. Many of these were extremely fine, especially notable in this respect being *Pride of the Market*, *Telephone*, *Telegraph*, *Ne Plus Ultra*, *Stratagem*, and *Giant Marrow*. Very interesting also was a dish of the Purple-podded Pea, and many other curious and excellent varieties were staged. Messrs. Rivers' superb collection of fruits, for which a silver-gilt medal was awarded, has already been noticed.

FRUIT COMMITTEE.—Present: F. D. Godman, Esq., in the chair, and Messrs. Harrison Weir, Francis T. Rivers, S. Lyon, Charles Ross, G. Paul, Harry J. Veitch, John Lee, F. Rutland, R. D. Blackmore, Sidney Ford, J. Willard, G. Bunyard, T. B. Haywood, John Burnett, Wm. Paul, and J. Roberts.

One of the most interesting exhibits before the Committee was a bunch of a seedling Grape shown by Mr. Bannister, Cole House, Westbury-on-Trym, Bristol. This is the result of a cross between Muscat of Alexandria and Black Hamburg, and in the bunch shown the berries resembled the latter in shape, but they were like the Muscat in colour and flavour. It is said to be an extremely free-setting variety and very productive, finishing well in a cooler temperature than Muscats. The bunch shown was not quite ripe, and the Committee expressed a desire to see it again later in the season, but in the meantime the general opinion was very favourable. Mr. Bannister also had some samples of Early Harvest Apples. Messrs. Paul and Son, Cheshunt, were awarded a vote of thanks for a collection of late Strawberries, comprising Loxford Hall Seedling, Cockscomb, Frogmore Late Pine, Sir J. Falstaff, Lord Napier, and Marie Nicaise. Frogmore Late Pine was considered the best and Cockscomb next, the last named having also fine fruits. From the same firm came a plant and fruits of a new Alpine Strawberry named Constantin Tretiakoff, and a new white Currant, White Versailles, extremely prolific, and bearing large bunches of fine berries. Messrs. Veitch & Sons showed several Strawberries, Loxford Hall Seedling being especially fine, and some excellent examples of Baumforth's Raspberry, for which a vote of thanks was granted. Messrs. Webb & Son and Mr. House sent several Peas, which were referred to Chiswick for trial, as was also Mr. Laxton's Strawberry Ultima, a cross between British Queen and Helena Gloede. Mr. R. Dean had good specimens of the White Chavigny Lettuce. Mr. H. Marriott, Boston, showed fine pods of Carter's Telephone and Telegraph Peas. Mr. C. Ross, Welford Park Gardens, had three dishes of Apples, Northern Spy, Lewis's Incomparable, Sturmer Pippin, well kept. Mr. Walker, Thame, showed samples of Pea Oxfordshire Gem, which he claims to be a rival to Telegraph. A seedling Melon from Hero of Lockinge and Blenheim Orange was sent by Mr. Coombs, Sheen House, Mortlake, and Messrs. Carter & Co. had growing plants of their Lilliputian Potato, with compact haulm 8 or 9 inches high and small curling leaves.

Nectarine Goldoni (Rivers).—A first-class certificate was awarded for this handsome Nectarine, which is of medium size, a fine golden yellow colour with a reddish tinge on one side, and of excellent flavour.

On July 10th a meeting of the Fruit Committee was held at Chiswick. Present: Mr. H. J. Veitch in the chair; Messrs. Weir, Haywood, Silverlock, Miles, and Bunyard. The Committee met for the examination of the Peas, and first-class certificates were awarded to the following:—

Autocrat (Veitch).—A dwarf wrinkled blue Marrow.
Prodigy (Veitch).—A tall green wrinkled very prolific handsome Pea.
Shropshire Hero (Eckford).—A dwarf white wrinkled variety.
Quality (Eckford).—Tall green, wrinkled, of fine quality and most prolific, a very promising variety.

The following Strawberries were certificated—

Waterloo (Mr. Bone, Latimers, Chesham).—Fruit large, cockscombed, very dark in colour and of good quality, distinct.

A. F. Barron (Laxton).—A beautiful variety with even conical fruits of a bright scarlet colour, very firm and of good flavour, possessing a pleasant acidity. This was formerly named Admiral.

Melon Longleaf Perfection (Mr. Pratt, gardener, Longleaf, Warminster).—Fruit large, round, smooth, pale greenish yellow; flesh white, very melting, sweet. It is a seedling from Cashmere, which it much resembles.

FLORAL COMMITTEE.—Present Shirley Hibberd, Esq., in the chair, and Messrs. G. Henslow, T. Baines, H. Bennett, W. B. alby, W. Wilks, F. R. Kinghorn, J. James, H. Herbst, Amos Perry, G. Duffield, C. Noble, John Fraser, J. Dominy, H. M. Pollett, James O'Brien, E. Hill, G. F. Wilson, J. T. D. Llewellyn, Jas. Douglas, J. Hudson, and James Walker.

Messrs. J. Veitch & Sons, Chelsea, showed a distinct variety of *Clematis flammula*, named *rubra marginata*, the flowers neatly margined with purple. Some fine blooms of *Clematis coccinea* and the pure white *Andromeda speciosa cassiæfolia* were also staged, and a vote of thanks was accorded. Mr. B. S. Williams, Upper Holloway, had a plant of *Vanda Dennisoniana hebraica*, a pretty variety with the yellowish sepals and petals marked with dark lines, and fragrant, somewhat suggestive of Violets. G. F. Wilson, Esq., Weybridge, sent a basket of beautiful Lilies, all from the open ground, except *L. longiflorum albo-marginatum*. Mr. R. Owen, Maidenhead, had collection of handsome double Tuberous Begonias, several of which were certificated. Mr. Salter, Selborne, Streatham, had some flowers of *Sobralia macrantha splendens*, a very highly coloured variety. Mr. D. Munro, Dingwall, sent a collection of Fancy Pansies and a neat white *Viola* named *Snowdrift*. Mr. Burrell, Chislehurst, had a collection of seedling Begonias. Some attractive Regal Pelargoniums were shown by Messrs. G. Bunyard and Co., Maidstone, one of the most notable being *Princess Alexandra*, white with a crimson spot in the upper petals, very free and of good habit. R. H. Measures, Esq., Streatham, showed several Orchids, the curious brown-coloured *Odontoglossum cristatellum* having three spikes, and *Epidendrum vitellinum majus* had large brilliantly coloured flowers. A. H. Smee, Esq., The Grange, Wallington (gardener, Mr. Cummins), exhibited *Cattleya Wallis*, with white flowers, the lip blotched with orange; *Lycaste Deppei viridis* and *Oncidium cornigerum*. Messrs. J. Carter & Co. sent a beautiful Sweet Pea, named *Dedham Rose*, of a very distinct rose colour, also a double *Sileue pendula compacta* of a much brighter colour than the single form; and *Rhodantha Manglesi alba*, a white-flowered variety. Mr. Cobb, Silverdale, Sydenham, showed a plant of *Odontoglossum vexillarium Cobbianum*, which had a white lip and rose-coloured sepals and petals. Messrs. Heath & Son, Cheltenham, contributed a wonderfully fine *Odontoglossum vexillarium* named *giganteum*, the lip of which was 4 inches in diameter, and the colour was also good. Mr. Eckford, Boreatton Park, had a fine collection of Sweet Peas, which were highly commended. Messrs. Sanders & Co., St. Albans, showed a spike of *Cattleya Sanderiana* with seven large flowers. Mr. King, Aylesbury, had two new *Coleuses* *Pride of the Market*, prettily mottled, and *Lord Rothschild*, crimson. Mr. R. Dean exhibited some fine spikes of *Ten-week Stocks*, *Bedfont Crimsou* and *Mauve Beauty*. Messrs. Henderson & Co., Maida Vale, had an extensive group of *Caladiums*, and Mr. C. Turner showed plants of the handsome white *Carnation Lady Rose Molyneux*, a floriferous variety.

CERTIFICATED PLANTS.

Rose Pride of Reigate (Paul & Son, Cheshunt).—A distinct and handsome sport from *Comtesse d'Oxford* obtained some time ago, and now thoroughly tested. It is of a fine rich crimson colour, splashed and mottled with a lighter shade or white. The blooms are full and of good form.

Rose Madame Norman Neruda (Paul & Son, Cheshunt).—A beautiful H.P. of fine substance and excellent form, the petals slightly recurving colour, a clear rose pink, and extremely fragrant.

Pelargonium Blanc Parfait (Bealby).—A double white Zonal variety with neatly formed flowers in compact trusses.

Pelargonium Rubens (Bealby).—A double Ivy-leaved variety, the flowers very full and of a flowing rosy scarlet hue, most distinct and effective.

Renanthera Storyi (Hill).—One of the *R. coccinea* type, but differing in the broader and more richly marked divisions of the flower.

Odontoglossum vexillarium Measuresi (Measures).—A pure white variety, with only a slight shade of yellow in the centre of the lip.

Alocasia Hendersoni (Henderson).—A handsome *Alocasia* with metallic-like, dull dark green, and whitish leaves, sagittate in form, 12 to 18 inches long and 6 broad, with a puckered surface and strongly marked veins.

Begonia General Gordon (Owen).—An enormous double Tuberous variety, with salmon rose-coloured flowers.

Lilium Parryi (New Plant & Bulb Company).—A distinct and now well known Lily, with flowers of moderate size and bright clear yellow in colour.

CHRYSANTHEMUMS—STEM AND ROOT CUTTINGS.

REFERRING to several notes which have of late appeared as to Chrysanthemums being in flower, it may be pointed out that this is no uncommon feature; at least I have had experience of it for many years. When I first had to do with Chrysanthemums it was to grow them for purposes of exhibition, and it was then I found that several sorts had a bad tendency of flowering in summer when cuttings were taken from the flowering stem of the parent plant. It was a cause of much annoyance to grow and train a number of plants for several months to find a few of them flower at a season when not wanted. The lesson I learned then I have remembered ever since, and that is always to select cuttings from the rootstock. *Cedo Nulli*, especially the lilac variety, and the varieties of Mrs. G. Rundle, are very liable to flower in this way, and I should be inclined to believe that any Japanese sorts will do so also.

I well remember many years ago how Mr. Forsyth of Stoke Newington created a small sensation by showing cut-down plants in flower in the end of June. Of course if plants are wanted to flower in June it is worth knowing that this can be managed by selecting cuttings for the purpose.

However, this is quite another thing from keeping the same plants flowering for six months; and it must not be expected that any of these *Chrysanthemums* will flower between July and their usual period of blooming.—R. P. B.

ANNUAL REPORT OF THE CAMBRIDGE BOTANIC GARDEN SYNDICATE.

THE Botanic Garden Syndicate report to the Senate of the Cambridge University that the general condition of the garden is very satisfactory, and amongst other items occur the following:—Various valuable alterations have been made in the arrangement of the contents of the plant houses. A few flowering shrubs have been planted in the long Fern house, thereby improving its general appearance; and some of the finer Ferns have been selected for better—i.e., more careful cultivation than is possible when all are mixed together. The collection of Orchids has received special attention, so as to promote the health of the plants and at the same time reduce the amount of labour necessarily bestowed upon them. Endeavours have been made by the formation of brick enclosures to improve the cultivation and thereby the general appearance of various kinds of plants. Insectivorous plants have received much attention with the view of obtaining as perfect a collection of them as possible, and providing the principal species in sufficient quantity for scientific investigation. The same object has been kept in view in the cases of other plants of special interest.

Much time and labour have, as usual, been expended on the correct labelling of the specimen plants. Nearly 2300 large labels have been renewed during the past year, and between 4000 and 5000 of smaller size have required to be re-written. These labels are now nearly all made of zinc, which combines the advantages of permanence and cheapness. The bog garden is considerably improved by a re-arrangement of the water supply and by the formation of a drier portion adjoining the boggy part. Labour provided for by the special grant has been applied to the extensive thinning of the belt. This has long been much needed in order to allow the trees to develop their true character. The ground under the trees has been extensively sown with grass, thereby rendering them more easily accessible, removing the mass of weeds which grew there, and reducing the amount of labour necessary in this part of the garden.

Among the principal plants of scientific interest that have flowered in the garden are *Allium karataviense*, n. sp.; *Antigonon leptopus*, which has flowered very rarely in this country; *Arctotis Leichtliniana*, n. sp.; *Cochlostema Jacobianum*, possessing remarkable structure; *Gazania longiscapa*, a figure of which will be published in the "Botanical Magazine;" *Impatiens episcopi*, a new and valuable plant; *I. Hookeriana*, a fine species rarely flowered; *Iris Bartoni*, drawn for the "Botanical Magazine;" *I. Bloudowi*, new and rare; *I. hexagona*, "Botanical Magazine," t. 6787; *Jasminum angulare*, a new introduction received from Mrs. Birks; *Narcissus pachybolbus*, drawn for "Botanical Magazine;" *Nelumbium luteum*, difficult to grow and rarely flowered; *Nymphaea flava*; *Passiflora foetida* (pectinifera); *Salvia paniculata*, "Botanical Magazine," t. 6790; and *S. Greggii*, *Botanical Magazine*, t. 6812.

Among the species that have been of special interest as producing their fruit are *Pandanus furcatus*, *Thladiantha dubia*, and *Vitis pterophora* (*V. gongylodes*), flowered before, but now fruited for the first time. A speciality has been made of the genus *Salvia*, and four species derived from this garden have now been figured in the "Botanical Magazine."

About 1055 plants and 678 packets of seeds have been received. The number of plants is less than usual. As it has been considered necessary to limit exchanges on account of the large amount of labour it entails, and because the great increase in the number of plants with but the same insufficient staff has been found to make limitation necessary. Important plants, however, have been sought with no less diligence, and of those probably as many as usual have been received from the Botanic Gardens of Kew, Edinburgh, Glasnevin, Trinity College, Dublin; Jardin des Plantes, Paris; Liège, Palermo, Jardin des Plantes, Montpellier; St. Petersburg, Saharunpore, and Melbourne, and a return has been made to the majority of them.

The valuable collections of plants from Kew require special mention, as also a fine collection of *Ivies*, *Clematis*, and new plants from Messrs. Jas. Veitch & Sons, *Rosa* (species and varieties) from Messrs. Paul & Son, new *Irises* from Prof. Foster, *Croci* from Col. T. Clarke, new and choice plants from Herr Max Leichtlin, collection of plants from St. Petersburg, new plants from Mr. Wm. Bull, and collection of *Gesneriaceae* from Messrs. Ant. Roozen & Son. As new plants of value introduced to the Cambridge Botanic Garden, *Porana paniculata*, a fine *E. Indian Convolvulus*, and *Impatiens episcopi* may be mentioned.

The condition of the roads and fences in the "Field" has been considerably improved. During the winter 352 yards of road were remade, and will last in good order with little attention for some years. The Thorn hedges have been made good where necessary, and about 110 yards of new hedge has been planted. A pair of swans was last year presented by St. John's College, and have been placed in the pond, where they have entirely prevented the appearance this season of the worst of the water weeds, *Potamogeton lucens*, which before grew thickly in every part.

RELATIVE VALUE OF MANURES.—I think your correspondent "Another Thinker" has hit the right nail this time, and deserves corroboration, for although the manure I use (Standen's) appears high-priced, I obtain good results from spoonful doses, hence it goes much farther than apparently cheaper articles. Your correspondent, Mr. W.

Taylor, bears me out, for he recommends half a pound of Standen's 10 square yards.—J. L. B.

HORTICULTURAL EXHIBITIONS.

THE following list of Shows, with the dates, may possibly be useful for reference.

- July 16.—Chiswick. Helensburgh (Roses). Winchester.
 " 18.—Birkenhead (Roses).
 " 21.—Newcastle, Staffs.
 " 22.—Newcastle-on-Tyne.
 " 25.—Darlington (Roses).
 " 28.—Royal Horticultural Society (Carnations, Begonias, &c.). Buckingham.
 " 29.—Aberdeen.
 " 30.—Oxford.
 August 1.—Liverpool (two days). Southampton (two days).
 " 2.—Antwerp Exhibition of Plants (five days).
 " 3.—Northampton.
 " 11.—Royal Horticultural Society (plants and flowers).
 " 18.—Basingstoke.
 " 19.—Shrewsbury (two days).
 " 20.—Salisbury.
 " 21.—Exeter.
 " 25.—Royal Horticultural Society (Cottagers' show).
 " 27.—Ludlow. Reading.

HARDY FRUIT GARDEN.

AGAIN has dry weather put our arrangements for the garden water supply to a severe test, and glad should we be to know that all gardens could have as plentiful a supply as ours has, and yet we had simply to make a pond to catch the waste water of a reservoir to insure an ample supply always. In addition we have the house sewage thrown up to the fruit garden by a force pump and underground pipe, and the supply of this fertiliser is always in excess of the demand. With such facilities it is an easy matter to keep fruit swelling without a check, and the sewage is of especial value among bush fruit, not only while the fruit is swelling, but subsequently to promote strong wood growth and the development of plump buds for next year's crop. Black Currants can hardly be overdone with sewage now. We like to see them throw up plenty of suckers as big as one's finger, and to have such shoots grow into sturdy branches fully 6 feet high; then, and only then, do we consider the bushes as fully grown and as capable of yielding as large a crop of fruit as they ought to do. Raspberries, too, require much water—preferably sewage now, and if the soil is left undug between the rows and a mulching of half-decayed manure applied as we have so frequently advised the roots are so close to the surface as to absorb moisture quickly, and the mulching checks excessive evaporation. Clean water is used among Strawberries to assist the growth and ripening of the late fruit. Without watering, the season of ripe Strawberries from the open beds is apt to be much curtailed by hot dry weather. Peaches and Nectarines now derive much benefit from frequent waterings applied to the border. The foliage must also be kept clean and free from red spider, or it is liable to be shed prematurely to the serious drainage of both fruit and wood growth. In using a syringe see that the water is forced well upon the under side of the leaves, for that is precisely where the spider so often does harm. See to the training of young trees, and remove or loosen all fastenings likely to prove hurtful to the swelling growth. Where nails and shreds are used for wall trees, nails against which fruit is pressing must be carefully removed. The crop of Figs, especially of Brown Turkey, is so abundant that the fruit has been thinned. This is never done till fruit-shedding is over, a certain proportion of the fruit often growing for a time and then falling off prematurely. As Gooseberries ripen much pains must be taken with the netting, or the blackbirds will find a way in to the fruit. A couple of garden mats put round each bush with a piece of netting across the top is better than all netting, as the birds always try to find a passage in at the bottom.

FRUIT FORCING.

PEACHES AND NECTARINES.—In private establishments where it is necessary to maintain a steady supply of fruit throughout the season, houses that will contain three or four trees each are better than larger houses in which early, midseason, and late varieties must be planted so as to afford the needful succession. The difference is really a matter of arrangement, a division making all the difference, and then planting with varieties that will succeed each other in the order of ripening. For the earliest house—Peaches: Alexander, Hale's Early, and Stirling Castle. Nectarines: Lord Napier, Hunt's Tawny, and Elruge. Second early house—Peaches: A Bec, Grosse Mignonne, and Royal George. Nectarines: Violette Hâtive, Stanwick Elruge, and Pitmaston Orange. Midseason houses—Peaches: Dr. Hogg or Belle Beauce, Noblesse, Violette Hâtive. Nectarines: Hardwicke Seedling, Large Elruge, and Pine Apple. Late houses—Peaches: Bellegarde, Barrington, and Late Admirable. Nectarines: Pine Apple, Albert Victor, and Victoria. Latest houses—Peaches: Walburton Admirable, Prince of Wales, Lord Palmerston, and Salwey. Nectarines same as preceding. We have only mentioned varieties of

known merit, and we do not wish to deter anyone from planting new varieties, as many of them have excellent points; earliness or lateness, size and colour may be mentioned as improvements shown in them, but rather to guard planters against giving the best positions to trees until their merits are thoroughly established. Although it is still too early to think of planting fruit trees, their removal to Peach houses is best performed before the fall of the leaf, hence the selection should be made during the next month, so as to secure the best trees, preference being given those that have been trained two or three years to walls and have the growths evenly balanced, clean, and moderately vigorous in growth.

CHERRY HOUSE.—The effect of forcing year after year is often a second crop of flowers, which necessitates precautionary measures. It is necessary, therefore, to note the development of the buds, and so soon as the wood has become sufficiently ripe the trees ought to be fully exposed, and where this cannot be done the structure ought to be completely thrown open—i.e., the ventilators. This, however, is not the sort of structure in which to grow Cherries, as it must be evident that the growths made this year will mature earlier than the preceding growth or that of last year, hence the necessity of exposure to the dews and ripening influences of the atmosphere. The subsequent attention will consist in keeping the foliage clean, and syringing them if the weather be dry; above all be careful to pay strict attention to the state of the roots as to moisture, as it is of the greatest importance, indeed essential, to keep them equally moist. If the rainfall be good they will not need water, but if the rainfall is insufficient recourse must be had and without procrastination to watering. When the trees show signs of debility let the condition of the roots be ascertained, and if these are healthy give the border a light sprinkling of Beeson's, Clay's, or some other manure, and wash in or apply manure in liquid form. This will encourage root-action, and the growth will show improvement in the coming season. In applying stimulants it should never be forgotten that weak supplies repeated are far more efficacious and safer than strong applications given occasionally, at the same time the watering when given must be thorough, as dribbles are practically useless.

CUCUMBERS.—Attend regularly to the stopping, thinning, tying, and arranging of the growths, and any plants showing signs of exhaustion should have the bed surface-dressed with an admixture of well-decomposed dung and lumpy loam, and the whole well watered, and then mulch with 3 inches thickness of sweetened horse droppings and maintain a suitable atmosphere. It is astonishing what effect an ammonia-charged atmosphere has on languishing vegetation, especially Cucumbers. Syringe the plants twice a day, being careful to use it soft and of the same temperature as that in which the plants are growing. Cold water gives a check, and is followed by mildew. Pits and frames cleared of Melons may be utilised for a late crop of Cucumbers, making a good succession to those in bearing, and by attending to them with linings a supply may be kept up until Christmas.

MELONS.—Canker is a great plague in some places, and though we have tried many things as a preventive it still appears; and though we consider it a consequence of too much moisture settling on or about the stems of the plants, we have had it most virulently when the soil about the plants has been kept dry. Hence we keep a sharp look-out for it, and on the least sign rub the affected part with quicklime. This, if taken soon enough, is a sure remedy, but it is no use trying to arrest it after it has obtained such hold as arrest the flow of the sap and cause the flagging of the foliage. Plants swelling off their crops will need liberal supplies of moisture both at the roots and in the atmosphere, but avoid a close vitiated atmosphere, for though the fruit will swell off to an enormous size it will be poor in flavour as compared with those grown in an atmosphere securing a thorough solidification of the growths by early ventilation and thorough exposure to solar influences. When the fruit is ripening a circulation of warm rather dry air will tend much to improve the flavour, but do not keep the soil very dry, sufficient moisture being given to prevent the foliage flagging.

Melons sometimes set very badly in frames at this time of the year, which mostly arises from the atmosphere being kept too close and moist. Admit a little air constantly, and avoid watering during the time the setting is wanted—i.e., the flowering, keeping the growths fairly thin, impregnating the blossoms daily after the frame has been ventilated some little time; and when four fruit or so have been secured on a plant remove all the other flowers and keep the laterals well stopped, and if likely to be crowded thin them a little at a time. Close early and damp overhead at the same time, keeping a space of a foot clear from the collar of the plants. Water will not be much wanted at the roots of plants growing on dung bed.

PLANT HOUSES.

Crotons.—Highly coloured plants in 5 and 6-inch pots are indispensable during the winter months for various decorative purposes in dwelling rooms and other positions. In order to have a good stock suitable to maintain an unbroken supply during the sunless months of the year, a good batch of cuttings should be rooted without delay. These plants root with great freedom at this season of the year in a close moist frame in a heated structure if kept well shaded from the sun. For this purpose strong cuttings or the heads of plants should be selected that possess well-developed finely coloured foliage. The cuttings can be rooted without losing a single leaf. The lower foliage should be well coloured before insertion, for it is impossible to colour the old fully developed foliage after the plants are rooted. If rooted in small pots they should be hardened to full sunshine by the time they are ready for the pots named, then be grown close to the glass, and fully exposed afterwards. The plants must not be crowded thickly together, or their symmetry will be destroyed. Large

heads can be inserted into 5-inch pots, and then no farther potting will be needed. Plants in smaller pots, and for grouping with other plants, may be rooted from time to time as cuttings can be obtained. The side shoots will do admirably for this purpose after the heads have been removed. We have always found a large batch of small plants in 2-inch pots very serviceable for associating with small Ferns. These are the last to be rooted, and for this object sturdy well-coloured side shoots are selected. Growth after they are rooted is prevented, for very rarely growth made in late autumn can be properly coloured, and without Crotons are in this condition they are not the most effective of decorative plants. Growth is prevented by keeping the plants in a sufficiently low temperature to have them in good condition without exciting growth.

Dracenas.—These will now need attention if they are to be in a highly coloured condition for decoration during the winter months. Young plants raised from the root portion of the stem of such varieties as *D. Cooperii*, *D. terminalis* and its white form *alba*, *D. Scottiae*, *D. Renardiae*, and *D. superba*, which are amongst the most suitable for this purpose, should now be placed into 5-inch pots without delay. These will make capital plants before autumn if grown on briskly in moist heat and shaded from direct sunshine. For growing in 7 and 8-inch pots for larger vases, *D. Baptisti*, *D. ferrea*, and *Ernesti* are very suitable, but these should be raised by rooting the heads of plants, so that they will possess large foliage at the base. All plants that have become tall and bare at the base should be ringed and mossed round the stem, and in a short time they will throw out sufficient roots to stand when taken off without losing any of their foliage. These make decidedly the best plants, and every attention should be paid to them. *D. gracilis* is decidedly the best of the green forms, and will stand for three months in a room without injury. Any plants that are growing too tall should be topped and rooted. It is not necessary to moss this variety, for if taken off where the wood is not very firm they will not fail to root. The tops of this variety should not be plunged in a close frame, or the foliage is very liable to damp. They strike best plunged in a shady corner of a warm moist house. *D. rutilans* is also valuable for room decoration, and the tops of any plants that are growing too tall should be taken off and rooted. This variety does well in the greenhouse or a cold frame after they are rooted, and will make sturdier plants than if grown in heat. Young plants still in pans may be potted singly and grown in an intermediate temperature until they are well established in small pots, when they may be gradually hardened and grown cool.

Gloxinias.—These plants are often grown in too much heat, and their flowers are drawn up weakly, with insufficient strength to support themselves. This should not be the case, and will not be if they are grown in an intermediate temperature from the time the flowers are visible amongst the foliage. From a structure of this description they can be removed to the conservatory directly they commence flowering, and will do better and last longer than when grown in heat. Without doubt these are amongst the very best plants that can be grown for the conservatory during the summer if prepared and hardened for the purpose. Late-sown plants now in pans and boxes should be placed at once into 3-inch pots, and if liberally treated will make good flowering plants in those, or even a larger size if desired. Plants that have done flowering should be regularly supplied with water, and occasionally weak liquid manure until the foliage has died. The last remarks also apply to *Achimenes*, and another batch of cuttings should be inserted in 5 and 6-inch pots to succeed those rooted some time ago.

THE BEE-KEEPER.

SKEPS VERSUS FRAME HIVES.

THEORISTS have put a far greater estimate upon frame hives and some modern appliances than experience can recognise. Interest on the one hand, and enthusiasm on the other, have led to highly coloured statements, causing an eagerness in many to provide themselves with such—which, after much expense, led to disappointment and loss, damping their ardour, and spreading distrust to others; whereas, had the bee-keepers' zeal been less, and their discretion greater, they would have reached the goal sooner, with more satisfaction to themselves and their neighbours. I do not place the straw hive on a par with frame or Stewarton hives; but straw hives have properties that frame hives do not possess. In previous articles I have shown straw hives to be valuable, and unsurpassable for preserving and wintering bees, their crooked combs forming the best nursery for a rapid increase of bees, excelling all others on this point. Where straw hives have been of proper dimensions, rightly managed, and thoroughly protected from the weather, with sufficient entrance, I never knew of stocks being killed through an accumulation of dead bees on the floor. There was then no need for a hooked wire to clear away the dead—that in-

vention was necessary only for defective hives that have traverses between the entrance and combs, low porches, crooked entrances, or frames across the entrance. The latter is a mistake, as was shown in this Journal by Mr. Woodbury long ago, and I also proved it to be one of the direct causes of dysentery. There are many forms of abdominal distension brought on by other causes, but none so fatal as that brought on by draughts or a vitiated atmosphere. The straw hive has, in a great measure, an entire immunity from these calamities. It has at all times a free circulation of air, but without a draught. The former bees cannot do without, and will not thrive without it. A stillness of air in a hive is as prejudicial to bees as a draught can well be. If bees from a straw hive reach the landing board after an airing during the winter or early spring, from the proximity of the combs to the entrances they will in most cases re-enter the hive in safety; but not so where the combs are far from it, and the passage forming a labyrinth. When this is the case many bees get chilled, making the obstruction greater. Porches from 1 to 3 inches high are also most destructive to bees; the roof of these should not be less than 6 or 7 inches high.

The above are not all the advantages straw hives possess over the unwieldy and badly constructed modern frame hives which in many cases are not only expensive but useless for a great number of bee-keepers who depend upon their harvests of honey by moving their bees from one district to another. Single-cased, Stewarton, and straw hives are all well adapted for this purpose, but straw has nothing to recommend it over wood; but for travelling purposes, and the ease by which it can be rendered safe by ventilation, is certainly, to some bee-keepers, of greater value than many frame hives. There are but few things necessary to procure honey—viz., bees, flowers, weather, and a hive commodious enough to hold the stores gathered during the honey season. Bees will not lay up more honey in a frame hive than in a straw one, and, as I have shown, no hive is better for raising bees than a straw one—the wooden ones may be equal. We are told that, by the use of the extractor, frame hives yield more honey; but there has never been any reliable proof adduced as to this, and, unless it is extracted after being sealed, the quality is not so fine as when taken from sealed combs from straw hives.

Frame hives have, doubtless, the advantage over straw hives in their adaptability to receive comb foundation, the preserving of combs for future use after being extracted, for the rearing of queens, and their disposal at times, impracticable in the straw hive. There is, perhaps, an advantage in frame hives in being able to discover with certainty whether it is or is not in possession of a queen; but other properties claimed, such as the combs being interchangeable from one place of the hive, and from one hive to another, serve no good purpose—in fact, the reverse. Combs rarely match each other when made to change places, and foul brood has been often spread through the exchange of combs. The loss of queens from straw hives is so rare that it can scarcely be called a great defect. Though we cannot ascertain the fact by ocular demonstration, a clever bee-keeper can usually tell when a hive is queenless by the action of the bees. It is better that one hive should perish through this defect than many (as has often been the case) by manipulation. More queens have been lost from frame hives when manipulating than ever occurred in straw hives when left alone.

Frame hives furnished with comb foundation give a great advantage over those not so provided; but straw hives, if made cylindrical and provided with bars, are equal to them. But even where this is not the case, the advantage is not all on the one side. Though those furnished with sheets make most progress for a few days at first, I have found that those not so provided made greater progress after a while. Then, as the honey season in this country lasts only from eight to twenty-one days at a time—the latter seldom—this unfixed number and uncertainty of honey days forms a wide gap for discussion on the profit or otherwise of extracting, and the

actual amount of profit, if any, by using foundation in frame hives, or the loss by not using it, in straw hives. In consequence of never having put the thing to a thorough test, I must leave that over until I am able, by actual experiment, to give a table of the results. I know very well that the foundation will give best results; but I am also sure that by taking one year and one season with another, the straw hive without it will not be so far behind as some would have us believe. Some frame-hivists have gone so far as to say that supers could not be obtained from straw hives. A more strange statement could not be made. Supers were taken from straw hives before there were any frame ones. If straw hives are properly made, supering can be carried on equally as well with them as any frame hive, and artificial swarming is more expeditiously performed with straw hives.

I trust the foregoing will be read with profit by those who cling to the old-fashioned hive, and read in the same spirit I have written it by those who condemn straw hives. My object has been to help those bee-keepers to do the best with the old appliances they have, to cheer and show them that the frame hive does not possess all and every advantage towards successful apiculture, but, at the same time, advise all to make a trial of modern hives; and I have no doubt they will, with the knowledge they possess, be able to get on well, if not better than they did with the older ones.—LANARKSHIRE BEE-KEEPER.

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Marechal Niel Rose (*J. Mc.D.*).—We are obliged by your letter, which, however, cannot be inserted this week.

Antirrhinums (*J. W., Pershore*).—If you cut off the faded spikes promptly, before seed pods form, and give a soaking of liquid manure, the plants, if fairly strong, will, in all probability, flower well in the autumn. We have often adopted this practice with very satisfactory results.

Vines Scorched (*E. L.*).—Your vinery is no doubt kept too moist and close. Do not damp it very late in the evening, leave the top lights open an inch all night, and give more air as soon as the sun reaches the house in the morning. The box and Grapes were smashed, but from what we could see the Vines are unhealthy.

Chrysanthemums for Exhibition (*Wordsworth*).—There has been delay in the delivery of your letter. Remove promptly all the buds that form in July. Use rain water from the tank, exposing it to the sun previously if convenient; hard water causes the leaves to shrivel prematurely. We will reply more fully next week.

Hyacinth Holders (*J. K. Young*).—Although we had not had an opportunity of actually trying the ingenious appliance it appears the point we mentioned was not unimportant, and you show a way out of the little difficulty. That Hyacinth spikes can be supported with the wires and clips there is not a doubt, but the value of the contrivance can only be fully tested by actual practice, and we advise you to send samples to a few persons who grow Hyacinths largely in beds, and ask them to try the holder next spring.

Yellow Rose not Flowering (*E. W.*).—If yours is the "Old Yellow" Rose all you can do is to encourage healthy growth with liquid manure if necessary, let the shoots be fully exposed to the sun to ripen, and limit the pruning to the removal of the soft unripened tips. As we have many times stated, it is quite impossible for us to undertake to name Roses, as this can only be done by actual comparison with others in a large collection or at an exhibition; besides, the petals had fallen entirely from some of the blooms. We can only say the striped Rose resembles the York-and-Lancaster. We cannot even suggest the names of the others.

Mushrooms Failing (T. W. S., *Springfield*).—Either the spawn or manure is weak, the soil poor and lacking firmness, or the house is too dry and warm. There are very few Mushroom houses in which good crops can be had in the summer. The beds should have the coolest possible position from May till September, and artificial heat is worse than useless when the temperature exceeds 55°. All you can do is to cover the beds with litter, and water this occasionally for percolating to the soil and keeping it cool and moist: the house should also be kept damp and as cool as possible. If the beds are dry, give a good soaking of clear liquid manure, the colour of pale ale, nothing being better than the drainings from manure heaps.

Grapes Scalded (A. Lady).—We are very glad to hear that our advice proved useful. Your Vines appear now to be in good condition, but the berries you have sent are what is known as scalded. We suspect the night temperature of the house has been so low as to cause a condensation of moisture on the berries, and the ventilators have been thrown open too widely and too late on some particular morning, and the excessive evaporation with the attendant cold has chilled the fruit and injured the tender skin of the variety. Do not allow the temperature to fall below 65°, do not damp the house late, leave the top ventilators slightly open on fine nights, and admit more air very early in the morning.

Succulent Plant Unhealthy (B. J. B.).—Your succulent plant, *Sempervivum arborescens*, is not suffering by want of more heat, but by defective root-action. It has possibly been kept too wet in the winter and the soil was rendered sour. We should turn it out of the pot, remove a good portion of the old soil, say half to two-thirds of it, and place the plant in a clean well-drained pot, only just large enough to hold the roots conveniently, in fresh turfy loam with a slight addition of lime rubbish and wood ashes—a tenth part or so, and if watered judiciously it will recover. It will be better shaded for a few hours during the middle of the day till fresh growth commences, then it cannot have too much sun. Water must be given whenever the soil appears slightly dry, and only then. Very little water is required by these plants in the winter. Your Rose is perhaps the Red Damask and is very sweet.

Jersey Lilies—Destroying Ants (E. H.).—Jersey Lilies are, we presume, the same as Guernsey Lilies, the botanical name of which is *Nerine sarniensis*. As the ants infest the soil it will be little use trying to trap them, but we should do this, getting a coarse sponge and dipping it in honey or treacle, and then squeeze it almost dry. There will remain after this sufficient of the honey or treacle in the interior of the sponge to attract the ants, which will enter it, and the sponge may be dropped in a vessel containing boiling water. Wash out the sponge, repeat the bait, and persist in this for some little time, and you will get rid of the ants. The baits should be placed near their haunts. A more expeditious method is by the use of Fir tree oil, which may be applied to the soil, and with care is not injurious to the roots, but the instructions given must be carefully carried out. They are printed on each bottle of the insecticide.

Pelargoniums Decaying (J. B.).—Your plants are attacked most seriously with the small centipede, *Julus guttatus*. The decaying stems are crowded with the pest. Such plants cannot recover, and the centipedes inside the stems cannot be destroyed without destroying the plants. We should at once dig them up and burn them, and you will either have to remove the soil a spade deep, spreading a layer of lime before adding fresh soil, or plunge potted plants in the beds for effect this summer, changing the soil in the winter. There is presumably much decayed vegetable matter in the land, and a very heavy dressing of lime would be beneficial. In all probability a small wineglassful of petroleum mixed in a gallon of soapsuds would be of service in extirpating the pest, and would also act as a manure for some kinds of plants and crops. You might try its effects on a few plants, and favour us with the results, increasing the petroleum so far as you find it safe to do so, if the lesser quantity does not destroy the centipedes.

Tuberous Begonias—Florists' Flowers (A. C. R.).—The varieties of Tuberous Begonias now so extensively grown for decorative purposes are as much florists' flowers as Fuchsias, Pelargoniums, or Chrysanthemums are. All flowers are florists' flowers that are raised from seed, and in that way improved by florists whether any particular standard or merit has been determined or not. Primulas, Cinerarias, and Roses are as much florists' flowers as Auriculas, Carnations, and Pinks are, because the origin of the varieties is due to the art of the florist in raising improved forms from seed and establishing them for increase by other methods of propagation. According to the strict reading of the schedule the Tuberous Begonia for which a prize was awarded was not eligible for competition, but as it was staged no doubt in good faith, and as there is a difference of opinion among the members of your committee as to what constitutes a florists' flower, hence no clear definition in the schedule, the fault is quite as much that of the committee as the exhibitor, and we should therefore let the latter retain the prize he won, and advise the committee to make the schedule clearer another year.

Galls on Lime Leaves (Hortus).—The samples sent are what have been popularly called Lime Leaf Nail Galls, attributed to a gall mite named *Phytoptus Tiliæ*, though it is uncertain whether under this name more than one species may not be included. Upon their first appearance these galls are green, then they become yellow, this passes into red, next they are purplish, and finally brown. Their history is interesting, since the Lime was observed to be thus infected more than 150 years ago by the celebrated naturalist Reaumur. He was, however, much puzzled by them, and discovering in some of them a solitary larva, he supposed they were produced by a kind of fly or beetle. If he was right in his observation such larvæ could only have entered in order to prey upon the mites such galls may contain, for they are not attributable to other insects. So small and transparent are these mites that it is difficult to find them, and the plan generally adopted by naturalists is to wash them out with water, and then examine the liquid. On opening one of these galls it mostly appears to be full of hairs of a peculiar growth caused by the punctures of the mites. It cannot be said that the history of these galls is as yet properly elucidated, and it is maintained by some that the mites which they commonly contain are not the real parents of the galls, but "inquilines," or after tenants. Nor can we say how it is, that of two trees, seemingly growing under the same conditions, one will be found swarming with galls, and the other almost as entirely free from them.

Judging Window Plants (G. H., *Chelsea*).—There are no rules of guidance for judging published anywhere to meet such circumstances as those to which you allude. We are of opinion that no one should accept the position as judge who is not practically acquainted with the culture of the plants on which he has to adjudicate, because of the great liability of such a person to err in a decision. Assuming a person is competent he will not have very much difficulty in his work if he acts on the principle that a plant, whatever it may be, must be good in itself and of its kind to be awarded a prize—that is to say, better than others in competition with it. Then, if two plants are equal in appearance, the prize should go to the one that has been most difficult to cultivate. A well-grown plant of *Mignonette* may not be half so imposing as a second or third-rate Sunflower, but the prize should go to the former because of the immeasurably greater attention that must have been exercised in producing it, and so on throughout a show. We have seen injustice done to exhibitors by judges whose utmost desire was to be strictly accurate in their awards, but who lacked the experience requisite to arrive at a correct decision. It is a great mistake to think that it is easy to judge window plants and cottagers' produce. We know from much experience gained at the largest and richest of shows, and the smallest and most humble, that as much discrimination is needed in awarding the prizes at the latter as the former. As a rule it is safe to award the prizes to those plants that give the best evidence of cultural skill on the part of the exhibitor, regardless of the mere size of the "specimens" in competition.

Names of Fruit (*Campus Martius*).—Early Purple Gean; the fruit of the other variety appears to be too small to be of any special value.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should contain spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once. (R. H.).—No. 1 is *Pyrus salicifolius*, the others we cannot name without flowers, though No. 3 may possibly be *Shepherdia argentea*. It is not uncommon to find Cork Trees in this country. There is a much finer example in the Bishop of London's garden at Fulham Palace than the one you mention. (J. M.).—You would perceive by our reply we were doubtful as to the name of your Fern. From the better specimen now to hand it is identified as *Polystichum triangulare* var. *laxum*, of which the imperfect scrap sent last week was in no way characteristic. It is only right that fair samples of plants should be supplied for purposes of identification.

COVENT GARDEN MARKET.—JULY 15TH.

LARGE supplies reaching us, with soft fruit well in. The London season being nearly over, hothouse goods are in less demand, and prices lower.

FARMS NEAR LARGE TOWNS.

SPECULATIVE farming, rash ventures with crops hitherto untried upon a large scale, are an outcome of hard times which lands many a man upon the verge of bankruptcy. Among such undertakings the culture of Sugar Beet may be mentioned as having led to serious losses among farmers in the eastern counties. Flax is spoken of as another crop worthy of a trial; but can farmers generally afford to indulge in such attempts? Home farmers have so much land upon

their hands just now that they are bound to give due heed to every hint about profitable crops, but they would do well to be cautious about taking up or applying novel ideas to practice. Upon farms near large centres of population the wish to devote the land to some more profitable purpose than the cultivation of ordinary farm crops is very natural; but even in such an apparently favourable situation no step should be taken till it has been submitted to the common but safe test of supply and demand. A little inquiry will show if farm produce is obtained from a distance from the town; if so, there is a chance for profitable competition by farmers close at hand, and it is by no means uncommon for town supplies to be drawn from a considerable distance. For example, we know a contractor for the supply of fodder for a cavalry barracks who has at the present time to procure hay from a distance of thirty miles. Does not this fact show that farmers near that town cannot be upon the alert to supply a demand which must always exist there? Or it may be that the farm produce which they have to offer is so inferior in quality as to be rejected. This is a point of vital importance. If you would be sought out by large buyers, build up by energy and painstaking a reputation for the produce of your farm. A really first-class article is seldom difficult to sell at a price that is really profitable. As a case in point, take bad and good hay. Haymaking is generally considered to be an uncertain and, in unsettled weather, a difficult operation, yet we never saw a summer in which hay that was wholesome food for cattle could not be made by the exercise of due care. Upon a farm recently taken in hand we found several small ricks of inferior hay, most of it mouldy and devoid of the fragrant aroma which is always present in good hay. The bailiff's excuse was the want of a rick-cloth, ropes, pulleys, and poles. This want was supplied; but we had also to correct much slovenly practice in the haymaking of the present season. Machinery would doubtless answer perfectly well alone for making good hay could we find meadows with a full even surface devoid of hollows. But practically this is never the case, and small hand rakes must be passed over the hay; draw it into wind-rows and hand-forks be used to shake out thick locks, or to bring grass from under trees out into the open. As we write this we have in a thirty-acre meadow a mowing machine, tedder, horse rakes, and men with scythes, forks, large drag rakes, and small hand rakes all in full swing, and all doing an important part in the making of first-class hay, for the crop of grass is a heavy one requiring special care, for the exercise of which it certainly bids fair to repay us.

Turning to other crops, it is probable that a certain proportion of the land devoted to the production of ordinary crops would be a safeguard in most years; nor must it be forgotten that such crops must always have due attention upon home farms. Dairy farming might be enlarged gradually, not only for the sale of milk, but of cream, butter, and cheese, according to the demand, and there need be no fear of overstocking the market with first-class butter and cheese; it is the second and third-rate articles which hang on hand. If cows are kept solely for the production of milk for sale deep milkers must be had, quantity being our primary object; if for cream, butter, or cheese, then we must look to the quality of the milk, and, above all things, have an efficient dairy manager. In turning attention to fruit farming, we are bound to strive for quick returns upon our expenditure. Full crops of fruit are had from Strawberries and Raspberries in the second year under skilful culture. An acre or two of Red Warrington Gooseberry is always a safe investment. For a deep rich soil Black Currants are a profitable crop—perhaps the most profitable of all—and for a poor thin soil Pearson's Prolific Nut is equally commendable. Of fruit trees plant only those of proved excellence, such as Rivers' Early Prolific Plum, Margil Apple, or Williams' Bon Chrétien Pear—sorts to plant by the acre with Strawberries or Gooseberries between them.

A few acres of early or second early Potatoes answer well,

being off the land before there is much risk of loss from disease. Seakale and Asparagus are worthy of a moderate trial, but the general culture of vegetables ought only to be taken up under exceptionally favourable circumstances.

Green fodder crops are very desirable here both for home use and for the prompt sale usually to be had for all of them. Rye, Perennial Rye Grass, Trifolium incarnatum, mixed Grasses and Clovers, such as Cocksfoot, Meadow Foxtail, Timothy, the tall Fescues, with Red and White Clover, Tares, Saintfoin, Trefoil, and Lucern, all afford wholesome nourishing food, of which the surplus quantity ought easily to be sold at about 1s. per square perch. The culture of most of these crops has been explained in detail, and it will again be noticed at the right season. It will suffice now to say generally that for all of them the thorough systematic culture of the soil not only answers best, but is to be regarded as indispensable; and do not forget that a superfluous green crop ploughed into the soil proves an excellent fertiliser.

WORK ON THE HOME FARM.

"Barometer 30.23, rising. Thermometer, 65°. Wind, north. Light. Weather clear. High barometric readings prevail over the whole of Great Britain. The weather will most probably continue fine." Such was the remarkable statement published in a daily paper on July 6th in the midst of the haymaking, and we record it here as a bright and cheering fact, for it is our habit to look at the bright side of things, and although our silo will probably remain empty we shall not grumble at its cost, for it did good service last year, and may do so again. Be it rather our aim to make hay while the sun shines, and we have built several noble ricks, for we altogether object to a lot of small undersized ricks, poor in flavour, and with so much outside. But while the haymaking has been going briskly on some root crops have suffered, especially late-sown Swedes. Mangolds, on the contrary, are flourishing, especially where sown upon ridges with farmyard manure below. No blight or insect will hurt this valuable crop now, nor will it suffer from drought for some time to come, and we may reasonably expect rain in due course to help it on. For Wheat and Barley in bloom in the south the weather is most favourable generally, yet it is to be feared that upon heavy land Barley has suffered. Hop insects are prevalent, and washing of the foliage has to be closely attended to. High culture tells, as usual, in the Hop garden, the growth being especially vigorous and healthy. A large field of Carrots is looking very well just now, and we believe the culture of this useful root to be worthy of extension as a safe source for a supply of winter food for horses and cattle, and especially for dairy cows. Some trial crops of Wheat afford a useful lesson. Champion White has the longest straw and finest ears, Velvet Chaff is next; then come Square Head Red, with fine sturdy straw and the promise of large heavy grain, and last comes Golden Drop, so decidedly inferior in every respect to the others that one wonders what special merit it has to induce the extensive culture of it. For general culture Square Head is probably best, its stout straw enabling it to withstand storms well, the grain being heavy and the yield good. Do farmers who complain that their land produces straw at the expense of grain ever take the trouble to test a few sorts of Wheat to see which answers best? Depend upon it, it is a mistake to take things for granted without a fair trial, and in Wheat-growing now it must be owned that we ought to grow nothing but the best sort for our particular soil. We are free to own that we have been selling straw, for we cannot afford to waste money upon poor Irish cattle, and we cannot procure enough of any other good breed for our purpose. Artificial manure will therefore be used instead for all purposes next season, and we hope to economise both in manual and horse labour.

REMARKS.

5th.—Very fine summer day.
6th.—Fine and hot.
7th.—Fine and bright, but cloudy in late afternoon.
8th.—Showers early, cloudy morning, fair afternoon.
9th.—Fine and bright.
10th.—Hazy and oppressive morning; fine afternoon.
11th.—Bright and hot, with pleasant air. Lightning at midnight, and sharp rain early on Sunday morning.
A thoroughly fine week of warm summer weather.—G. J. SYMONS.

WAITING FOR RAIN.

IN this part of the country we have long waited anxiously for rain, but up till to-day, July 16th, nothing but disappointment has resulted, and we have decided to go to work on the supposition that the dry and very hot weather will not yet be broken. As far as the flower garden is concerned it does not matter much, as the brightest of all summer plants—viz., Zonal Pelargoniums, seem to revel in the weather we are experiencing, and other kinds are doing fairly well. It is in the kitchen garden where the mischief is being worked, notably among small fruits generally, Potatoes, and winter vegetables. The two former must take their chance, but not the latter, as if Potatoes are to be small, or what is more likely to happen, be of bad quality owing to the formation of a second crop directly we get a soaking rain, there will be all the more need for us to strive to have green winter vegetables in greater abundance. But if we wait too long for rain the plants will be spoilt in the seed beds and a good part of the growing season lost. Undoubtedly when we do get a "soaker" the plants, owing to the warmth of the ground, will grow as if they were in a hotbed, too strongly perhaps, but while we are waiting for this change in the weather the seedlings are fast becoming wretched objects, and certainly not calculated to grow into those sturdy plants that we think so desirable for standing a severe frost.

Many sow the principal portion of the seed of Broccolis, Kales, and Savoys in March or early in April, and these, in numerous cases, are yet in the seed beds. We were designedly later than usual in sowing all but Brussels Sprouts, autumn Cauliflowers, and Veitch's Autumn Broccoli, the first week in May being the time when Broccolis, including Snow's, Veitch's Broccoli and Cauliflowers (second sowings), midseason and late Broccoli, all sorts of Savoys, including Gilbert's Universal, Chou de Burghley, and Kales were sown. These have become rather large and crowded, and are now being put out as fast as we can plant them; and although it most probably will entail much extra labour in keeping them growing as it did in getting the ground ready for them, I prefer this to spoiling the plants, as many are doing, in the seed beds.

In some places we are following Peas without digging the ground, in others Potatoes; but the worst quarters, as far as the working of the ground is concerned, are those necessarily summer-dug. In each case drills were drawn with heavy hoes, all hard clods, and they were very hard, being broken down, and then a soaking of water was given, this admitting of deep planting with dibbles. The seed beds were also soaked with water, and as then it was still impossible to preserve many roots or soil about them, a puddle was formed and all had their roots well coated with the muddy moisture, with the results of the plants being less liable to completely collapse. It is useless to put out plants in very hot weather unless the soil is made very firm and moist about the roots, planting with the trowel being as a consequence less safe than is the

case when a dibble is used. The majority of our newly put out plants certainly look unsatisfactory, but they will soon recover, and when a soaking rain comes they will be quite ready to profit by it.

In many gardens very little space can be afforded the seed beds, and the seedlings, instead of being about 12 inches or 14 inches high when planted out, are nearly double that height. If I had such unpromising plants to deal with they would not be planted with either trowel, dibble, or crow-bar, but the spade would be the implement preferred. To bury the stems deeply in order to materially reduce the length exposed above ground would not do, in cold soils especially, and the plants would not make satisfactory progress, but if sloping trenches were cut with the spade, the plants laid in and firmly covered so as to completely cover the stems only, they would soon right themselves. Thus treated they, as I have proved several times, will succeed surprisingly well, especially if a little good manure is distributed in the trenches, the roots soon taking hold of this, and a good start is made. This plan is to be commended for late-planted Broccoli especially, and I have known a breadth of plants thus treated be the only survivors after a severe frost, and though comparatively small produced very good heads. Late sowing and late planting on a high and rather exposed position will insure a late supply of Broccoli, and that, too, with varieties not generally considered late.

Chou de Burghley I hold to be of little value when sown and planted very early, as in this case they become much too large and blanched to be either hardy or acceptable in the kitchen. Sown early in May and planted out about 18 inches apart in the rows, and about 2 feet from row to row, they will yield a good cutting in midwinter; at least, this is as far as my experience will go, as we have yet to prove that it will stand an extra severe frost. We have just planted a good breadth of it, and also the Universal Savoy, and trust the latter will develop all the good qualities it is said to possess.—W. IGGULDEN.

HYBRID POTENTILLAS.

AMONG really good hardy summer-flowering perennials there are few, if any, calculated to produce a more lengthened display of flowers than the single and double forms of these Potentillas. They in consequence deservedly hold a position second to none among hardy florists' flowers—are, in fact, one of the most beautiful, interesting, and valuable groups of perennials. Whether required for the mixed border, the rockery, or in beds by themselves, they in all cases make a most effective display with their diversely coloured flowers. These are abundantly produced from the middle of June to the middle of August, the colours ranging from rich velvety and brilliant crimson to maroon, scarlet, together with rich orange and golden and canary yellow. Then we have many pleasing and varying shades, and sometimes the flowers are distinctly spotted, margined, or marbled. Particularly effective are the yellow selfs and which are almost unique in their way at this time, for yellow flowers are not particularly abundant when these are giving their flowers in plenty.

In common with several other fine groups of summer flowers, Potentillas have been much improved in form and size of flowers during recent years, improvements, too, which in a great measure owe their origin to the enterprising florists across the Channel. The substance of the flowers generally is much superior to the original single forms, which, together with the increased number of petals, makes the flowers, either on or off the plants, much more durable; but it will be well to remark that they are not really good in a cut state, while as decorative border plants they are among the best.

The soil which suits them best is a deep rich loam, the deeper the better—that is, if large handsome flowers are expected. Nearly all ordinary soils which are fairly rich will grow them well, but to bring them to perfection there is nothing like a rich and deep loam. Therefore the ground

should be well trenched (indeed this is not lost on any crop), and heavily manured, and with good plants the individual blooms should be as large as a crown piece; this is not an extraordinary size, however, as I have had them in quantity of similar size in somewhat stony ground, but which had been well manured previously.

The Potentillas are quite hardy—no frost will harm them in the least, and when out of flower they are not unlike the Strawberry in their silver tufts of leaves. From amongst the leaves issue the numerous flower stems, which usually attain a height of 2 feet, rather below than above, and consequently are of a serviceable size, and being of compact habit there is no trouble experienced in this direction. One point in favour of them is their adaptability for towns or smoky districts, and for this purpose these plants, and also German Irises, are very useful; in fact, I know none better suited than these two groups, and being so readily increased (the Irises especially so), it is surprising they do not find a home in many of our public parks and gardens. While the Potentillas are not so readily increased by division as many hardy plants, they have the good qualities of being free seeders, so that a stock may soon be raised in this way, all of which may be sufficiently good for the shrubbery border if they do not attain perfection from a florist's point of view. Seeds sown in early spring produce plants that will, if placed out in beds when sufficiently large to handle, make good strong flowering plants for next year. The other modes of propagating them is by division, and also by means of cuttings. The latter will be best carried out in the following manner: At the present time the growths from large plants will be numerous, and as it will not be prudent to lift the plants now they are coming into flower, the only alternative is to remove the soil from around the collar of the plant, so as to bare the upper portion of the somewhat woody rootstock, and then strip off with a heel attached as many as may be deemed prudent, so as not to sacrifice too many flowers. Insert these in sandy soil, without further preparation, in a somewhat shady position, and cover with a handlight; in about three weeks the majority will have formed roots. I have, it may be well to remark, a strong dislike to the knife in propagating many hardy plants, for many failures are traceable to this alone, and in many instances which have come under my notice the portions which would have emitted roots freest and earliest have been cut off, and so it is with Potentillas. Phloxes, Pentstemons, Sunflowers, and similar plants having softwooded stems, root most readily from soft, sappy cuttings.

It may not be unreasonable to assume that if the progress among these plants continue, that they will ere long be as double as are many Persian Ranunculus at the present time, not that being so would make them any more beautiful than now—rather the reverse, since that portion of the flower which can easily be seen and admired now would be hidden from view. I will briefly enumerate some of the most distinct varieties, and will take the singles first. Of these there is none more striking, more profuse, or beautiful than *P. formosa*, which produces in the wildest profusion its bright cherry-red blossoms, a most telling plant in the rock garden. Others are *Hopwoodiana*, *Smoutti*, and *Russelliana*, with various other forms. The best doubles and semi-doubles will be found among the following: *California*, *Chromatella*, and *Vase d'Or* are yellow selfs, and all very fine. *Aurantiaca* is a good orange; *Dr. André*, golden yellow suffused with vermilion; *Hamlet*, very dark crimson, very fine; *Louis Van Houtte*, deep crimson, this is best dark variety; *Velours Pourpré*, deep blood crimson, very large; *Duc de Nassau*, chestnut red, suffused with yellow; *Cameleon*, scarlet striped purple and yellow; *Versicolor fl.-pl.*, a very pleasing flaked variety; *Madame Rouillard*, soft velvety scarlet, shaded and edged with amber; *Le Dante*, yellow suffused with red, fine shape; *William Rollisson*, mahogany suffused with orange, very free; *Victor Lemoine*, bright vermilion, striped yellow.

To these varieties many more may be added equally good and attractive, and all deserving of culture; at present they

are evidently very little known, or they would be more frequently seen in gardens, for they will rank among the most popular of hardy decorative plants.—J. H. E.

OVERCROPPING.

How much fruit a tree can bear without injury is still in many respects an unsettled question. That there is a limit to a tree's endurance none can doubt, yet few can state definitely where the line can be drawn. Some trees constitutionally strong can bear heavier crops than those with a weaker constitution, other things being equal, but it has been frequently observed that stunted trees assume a more fruitful habit than their healthier neighbours. If these were allowed to perfect their fruit the evil of overcropping would soon be apparent in failing health and premature decay, but the cases are rare, owing to climatal and other influences in which overcropping alone has killed a tree.

If we study overcropping we find that the nature of the tree causes it to put forth all its energies in fruit-bearing, and as the crop is heavy or light, so the tree is weakened more or less. Now if there is no suitable nourishment applied to the tree to recruit its weakened strength it is certain that its vitality will be impaired, and the result will be inferior fruit in lessened quantities. If instead of this neglect the tree had been sustained according to its requirements it would have continued as fruitful as before. Our imperfect knowledge of the vegetable kingdom will not allow us to go so far as this, but a judicious method of cultivation will attain satisfactory results.

Partial failures in Grape-growing are more frequently attributed to this cause than any other, and with a certain degree of truth, but in many cases the Vine is overcropped simply because it is underfed. It is no exceptional case in which Vine borders are made with the greatest care, and Vines are planted where for a time they give satisfaction. But in the course of years unfinished berries and cases of shanking are the rule, and after the border has been examined to see whether the drainage is right, the cause is put down to overcropping. This induces a thorough overhaul, fresh soil is added to the border, and in the course of two years the Vines have improved wonderfully. Now this may have been the best way to act under the circumstances, but it could have been avoided by judicious nourishment in the first place. The fact that the Vines did improve showed plainly that weakness was the cause of their unsatisfactory condition.

Perhaps the Peach tree illustrates this reasoning more clearly than any other. Examine one carrying a full crop but imperfectly sustained, and it will be seen that in endeavouring to fulfil its mission the leaves turn a yellowish hue, and many of the fruits ripen prematurely, while the buds show poor prospects for another season. Turn to another carrying an equal crop but properly nourished; there the leaves have a deep green colour and the fruit ripens perfectly, the buds giving promise of a favourable crop next year. Overcropping is not to be judged so much by the quantity of fruit on a tree as by the assistance given to perfect that crop. In all cases it is the same. Whatever elements a plant extracts from the ground must be supplied again, or it will deteriorate in value, and in the constituents necessary for the proper sustenance of plant life.—J. MACDONALD.

THE HISTORY OF THE CHRYSANTHEMUM.

(Continued from page 3.)

It has been shown that the Chrysanthemum had rapidly risen in the estimation of the public, and was fast taking its place as a popular favourite in England. The next thing that will occur to the mind of the inquiring reader will be to know what progress it was making in France, to a countryman of which its first introduction was due.

A twelvemonth after Mons. Blanchard's importation it was cultivated in the Jardin des Plantes, where, notwithstanding what may be stated to the contrary, it received almost as little attention as the Chelsea variety did in this country in 1764, and nearly shared a similar fate. Thirty-six years after the old purple reached the shores of France, the only French author who has interested himself sufficiently in this plant as to write a distinct treatise on it asserts that there were but a very limited number known (according to Mr. Salter only fifteen kinds in 1822), and these of no particular merit either in form or colour, the best being of a dull lilac colour or of a doubtful yellow.

Few French florists at that period troubled themselves about its culture, and we may therefore assume that to us English people belongs the credit of first appreciating the value of the Chrysanthemum.

num as an autumn flower, and of making it take so prominent a position in the early days of its history.

This disdainful treatment by the French, however, was not entirely universal, for a Mons. Noisette, who visited this country in 1824, was presented with the twenty-seven varieties from the garden of the Horticultural Society, and a list of them was attempted to be given in the "Bon Jardinier" for 1825. Another, a distinguished lover of horticulture, who, having thrown down the sword for the spade and water-can, had grown the Chrysanthemum for some few years prior to that date. This gentleman, the now celebrated Captain Bernet, whose residence was situated in the south of France, speaking of his collection in 1826 tells us it comprised only three varieties. To his pen we are indebted for a very interesting account of his success in raising the Chrysanthemum from seed, and as he was without doubt the first man in Europe to do so his story will probably be read with some little interest.

The author is not aware that it has ever yet appeared in English, and it was called forth by the fact of Mons. Rouillard having in a report read by him before the Société Nationale d'Horticulture de la Seine stated that the climate of France would not allow of the Chrysanthemum producing fertile seed, which is sufficiently disproved by the large number of new sorts distributed by the French raisers during the past ten or fifteen years, and that to overcome this obstacle several of the French florists had been compelled to have recourse to growers in Spain and Italy. But, says Captain Bernet, "I assert that at all times this plant has borne seed in the south of France," and referring to his collection in the autumn of 1826 he observes that when his plants were going out of bloom they were the object of his sole anxiety, although he felt convinced that he would get some good seed from them.

"What, then," exclaims the gallant Captain, "was my joy, mingled, I acknowledge, with no little surprise, when in taking hold of one of their withered heads I found myself the happy possessor of several seeds bearing all the signs of perfect maturity and undoubted fertility. My good fortune was kept entirely to myself, but my most assiduous and attentive care was given not only to the seed-bearing plants, but to the seeds themselves, which in the spring of 1827 I carefully sowed with a success quite equal to my expectations, as a result of which I was rewarded with the raising of several fine varieties."

Encouraged by his first success, which attached him more and more to his favourite plants, he saw his collection annually increase by the addition of new kinds of the greatest merit.

Three years after this event an experienced nurseryman got possession of an entire set of the Captain's new Chrysanthemums, and propagated them for sale. Thus it was from 1830 to 1836 that his novelties were circulated and forwarded to the plant dealers in Paris and abroad.

There is scarcely any need to continue Captain Bernet's narration beyond observing that it concludes with the statement that after this he adopted the practice of sending to his nephew in Paris seeds and plants, and through him entered into arrangements with Mr. Salter at Versailles, and later on with such well-known florists as Mons. Pelée and Mons. Mieliez. At the end Captain Bernet adds a list of those varieties which he obtained during the first two years of his devotion to his favourite pastime, which is reprinted here more as a matter of curiosity than as being of any use at the present time:—Rose Croix, Duc d'Albuféra, Annibal, Maréchal Maison, Reine Blanche, Duc de Dantzick, Casimir Périer, Marechal de Créqui, Charlotte Corday, J. J. Rousseau, Georges Sands, Le Grand Napoleon, Baronne de Stael, Princesse Pauline, Duc de Trevisse, Général Foy, Buffon, Madame de Pompadour, Pygmalion, Bossuet, Socrate, Maréchal Lannes, Fléchier, Général Lamarque, Phenix, Salamandre, Chateaubriand.

During the course of his success nothing appears to have caused so great an annoyance as to find that there were even in those days unscrupulous people who resorted to the practice of changing the names of some of his greatest favourites. His nephew says that there were even some of his seedlings which, instead of the names attached by him out of various precious considerations, had had English names substituted.

This was mainly done for the purpose of enhancing their value from a commercial point of view. It is a practice that cannot be too strongly condemned, and has been denounced on more than one occasion by indignant growers, who have found themselves duped when too late to escape from the evil.

As the subject of double-named or synonymous Chrysanthemums has been touched upon, it will perhaps be handy for the amateur grower to be made acquainted with those he is most likely to meet with at the present. The following is based on the list published by Mr. N. Davis of Camberwell, with a few additions from the National Chrysanthemum Society's catalogue and other sources:—

PROPER NAME.	SYNONYM.
Albert de Naurois	Albert.
Angelina	President Sanderson.

PROPER NAME.	SYNONYM.
Argena	Inner Temple.
Beethoven	St. Patrick.
Boule d'Argent	Silver Ball.

White Queen of England	Mr. J. Starling.
	Snowball, Mrs. Cunningham, Empress of India, Lady St. Clair.

By way of conclusion to this chapter it may be remarked that the French Chrysanthemum growers are still very proud of the achievements of "the father of the Chrysanthemum" as he is called, and there still remain many of his varieties in commerce among the collections of their nurserymen and amateurs, probably more on his account than for their own value and beauty as flowers.

To the English they are mostly, if not entirely, unknown, and there are none now left in any of the trade catalogues issued in this country. Those still surviving in France of Captain Bernet's, which are taken from the catalogue of a florist who claims to be the grandson of Captain Bernet's old gardener are Cardinal de Polignac, Genius, Mammoth, Princesse Marie Amelie, Reine Bacchanal, General Pajol, Brissot, Emile Lebois, Gloire de Toulouse, Duc de Broglie, Temple de Salomon, Arc en Ciel, Anaïs, Sixte Quint, Bernetianum, Figaro, and Grand Napoleon—the only one out of his first set that seems to be left.

Continuing the story of the early endeavours in France to improve the Chrysanthemum by raising seedlings, it has been somewhat vainly asserted that had it not been for Mons. Bernet's zeal in that direction, and in spite of the rapid progress that was made in contemporary horticulture, the Chrysanthemum would in all probability have remained in its primitive state. To this opinion the objection naturally arises, that whatever the French might have thought and done independently of Mons. Bernet's efforts, it is certain that the Chrysanthemum had caused so great a stir in England that the numerous importations and sports would sooner or later have caused the florists of this country to consider and devise a means by which seedlings could be raised.

With what might or might not have been it is not the author's intention to deal. Accomplished facts, or rather the most important of them in the history of this plant, is all that can be touched upon in the narrow compass of a treatise like this.

The great success attending the labours of Mons. Bernet naturally excited the curiosity and stimulated others to vie with him in the raising of new varieties of this charming flower. Mons. Regnier of Avignon sent out a pretty variety under the name of Madame Hardy and several others of merit. A like success also crowned the efforts of several amateurs of Montauban, whose names are now forgotten. The learned Professor Lecoq of Clermont also cultivated it in his part of the country, but being unable to obtain any new varieties from seed as he lived in a more unfavourable climate he gave up growing. Mons. Regnier, too, discontinued its cultivation, and so for a time Mons. Bernet was left alone the indefatigable sower and raiser of the Chrysanthemum in France.

Mons. Boisgiraud and Mons. Rantonet, however, soon followed in the way that Captain Bernet was pursuing, and both raised some good kinds, while later on Mons. Bonamy, a raiser noted principally for his Pompons, was a successful grower.

Captain Bernet now began to exchange his seedlings with Mr. Salter and Mons. Pelée, and at the same time recognising in his nephew the late Mons. Lebois the zeal and enthusiasm of a Chrysanthemum grower, he regularly sent him half of his crop of seeds, thereby creating a rival whose successes, instead of exciting jealousy on his part, only tended to bind their relationship more tightly together.

Mons. Lebois, whose name was better known among us thirty or forty years ago, made considerable improvements in the Chrysanthemum, besides sending out a large number of Pompons and summer-flowering varieties. He relates that his first attempt far exceeded his expectations, for he obtained a charming flower which he named after a fashionable opera in that day—Giselle.

The second year's proceedings resulted in an utter failure; but, persevering in the same path, he had the pleasure of raising several new sorts in the third year, which were much appreciated and valued.

—C. HARMAN PAYNE.

(To be continued.)

THE SPLITTING OF FRUIT.

QUITE as much progress is being made in the discussion of this important subject as could reasonably be expected, considering the wide divergence of opinion that apparently existed on it a few weeks ago. In reviewing what has been said I shall endeavour to do so calmly, temperately, and seriously, as I think there has been enough of mere "retorting" for the present. It is encouraging, too, to feel that the discussion will not be a barren one, but will have a practical and almost certainly a beneficial effect, inasmuch as it will cause greater attention than heretofore to be directed to the question of ventilation and atmospheric moisture in structures devoted to the cultivation of fruit.

It not unfrequently happens in the course of a debate that those engaging in it are tempted to press their views a little too far, and before a settlement is arrived at there is a slight mutual yielding all round. I am quite willing to modify any statement I have made if it is not justified by an appeal to scientific authority or ascertained facts. This is in response to the admissions on the "other side," and, from my point of view, in the right direction. Stubbornness is not strength. The most unyielding have often to give way at last, or as Mr. Iggulden suggests about the "endosmotic theory," they get laughed at in their isolation. He can smile the smile of incredulity, but he cannot in that happy manner drive a law of Nature out of the universe, and the scoffed-at "theory" I shall have to show is a great fact. My intrepid assailant has already shown signs of yielding, as I will point out, and I am convinced that, protest as he may, he will have yet to admit that moisture does pass through the skins of fruit by the action of endosmose to a greater extent than he appears to have any idea of. I shall not try to convert him, but shall show how he may test the matter for himself, and if he dare not make a simple experiment for fear the results should tell against him he will not be in a position to hope that anything he may say against Dutrochet's great discovery can have any material weight.

I have said there has been a modification of views on the subject of fruit cracking. On page 264 Mr. Thomson controverted Mr. McIndoe's opinion on 225 as to moisture passing through the skins of fruit, and expressed what he termed the common sense view of the matter, that the excess of moisture was conveyed by the roots and girdling was the remedy. On page 329 he attributed the cracking of Mr. McIndoe's fruit at Manchester to expansion by heat. After my citation from Dutrochet on page 371 he gave evidence of his receptive mind by, on page 402, "quite admitting the action of both endosmose and exosmose when circumstances favour such action." That is quite sufficient. The principle is admitted, the precise circumstances being merely debatable. It is true on page 478 he "had" me on immersing Ferns, which I will refer to, but even then could not disclaim the endosmotic influence.

I now turn to Mr. Hugh Henderson, who in his letter (page 526 of last vol.) has not only proved himself a man of metal, but has taken up a far stronger position against the "endosmotic theory" than any other of my respected opponents. I will come to that in due course; at present I wish to report his progress. On page 422 he made the slight mistake of objecting to my giving the "whole" credit, or discredit, to the skins of the berries admitting moisture; and then suggested that Mr. McIndoe's Grapes cracked at Manchester by the moisture passing from

the air through the stems; but that will never do, because the Grapes at home on the Vines had at least ten times more moisture supplied by the roots and remained sound. There was not the faintest admission of the action of endosmose; and in his letter on page 478, in which he asks me some pertinent questions, he quite ignores its influence, whereas in his last and strongest letter against me, on the page quoted, he fully admits the existence of the principle. I say, then, we are progressing.

Next we have to note Mr. Iggulden's yielding. In his first great rush at myself, Dutrochet, and the doctors, on page 455, as if he would bear all down before him, he exclaimed "Candidly, are there 'any' practical men" who will believe a dictum that he manifestly regarded as absurd? yet after he "heard from me" (478) he rejoined by what he calls "again" asking (page 498) if there are "many" believers in the theory. From *any* to *many* is a great jump down, and as soon as he has made it he falls among the frogs in *Æsop's* fables. Then he goes on to "defy" (nothing if not strong) either myself or Mr. McIndoe to "crack berries in a well ventilated house by syringing them." Mark the condition, a "well ventilated house," which means, if it means anything, that they might split in an ill-ventilated structure if syringed excessively. That is an instance that occurs now and then of negative evidence being as powerful as positive. In my young days, long before the Duke was born, and the Grizzly Frontignan was grown much better than it is now, a standing injunction was not to syringe the "Grizzly" or it would split; and it would, and it will if syringed when it is ripening, as I well know, not from scientific reasoning alone, but from actual experience, no matter how dry the roots may be kept. Having regard, then, to both positive and negative evidence, I think I am justified in saying we are making as much progress as can be expected on the not-yet-fully-understood "endosmotic theory," that, old as it is, appears to have taken some persons by surprise.

Some arguments, assertions, and observations remain to be noticed. Mr. Henderson, on page 422, reminded us that cut flowers and fruits received supplies of moisture through their stems when inserted in water and implied, as Mr. Iggulden has done, that moisture can only pass through the "ordinary channels," except in very "minute" or "infinitesimal" quantity. It was in answer to that (page 458) that the immersion of Fern fronds, with the stalks in the air, was adduced in evidence to the contrary. This enabled both Mr. Thomson and Mr. Henderson to score a point against me on page 478—namely, that no moisture can escape by evaporation from immersed leaves, and hence they remain fresh even with their stalks in the air. That is a good argument as far as it goes, and I must say the replies were not unexpected. Now then let them gather some flowers, Pansies for instance, let the petals flag considerably, then immerse the flowers; also let them pluck sprays from, say a Rose tree, let the buds droop and the leaves become quite flaccid, then immerse similarly, leaving the stalks above water, and they will find flowers, buds, and leaves regain their freshness, which can only be, by actual absorption and not very "minute," either in the case of much-withered leaves of Roses. This is mentioned as a point of interest that has arisen by the way. But to the fruit. I have never tried sealing the end of a lateral bearing a bunch of Grapes and immersing these, but Frontignans placed in water for a short time, then in a damp box kept close in a warm house, have split most decidedly, the temperature of the water and the house being 80° more or less; so have some varieties of Plums, Cherries, Melons with the stalks removed, Gooseberries, and Figs.

The mere degree of temperature is not very material in setting up the action of endosmose; it is a question of the quantity of moisture acting on and passing through the skins of fruit, causing a distension that they cannot bear, hence the emphasis that Mr. Iggulden places on the importance of judicious ventilation and a buoyant atmosphere. We are at one on that point, and I think on some others, but it will not do for him to yield too much at once. Of the counter action of exosmose I will speak when considering Mr. Henderson's last letter.

An opinion seems to prevail that the splitting of fruit is the result of an expansion of their juices by heat. Mr. Thomson suggested this as the possible cause of Mr. McIndoe's Grapes splitting in the Manchester tent, as described on page 304, but he takes care to remind us on page 402 that it was only a suggestion, not an expression of his belief. Mr. Iggulden is a younger and bolder man, hence does not hesitate to assert on page 498 that the expansion of their fluids by heat is "really the 'true cause' of fruits cracking," and asks why I persistently ignore this. I have ignored it because not an atom of evidence has been adduced to support it; and when he says "dry heat does not unduly expand the juices," he places himself in a very peculiar position, and if he fully comprehended the action of heat on fluids not another word would be required to prove the fallacy of the expansion theory, but as a want of adequate information is clearly displayed on the subject, and as he has appealed to me, I will respond in a few lines.

I know that fluids expand, and the degree of their expansion under specified degrees of heat, and, let me add, of cold or declining temperature, and I have reason to believe that the force of distension of the fluids in fruit by the action of endosmose is enormously greater than the pressure resulting from the expansion of the same fluids by heat. It is true that fluids expand by heat, but so does the surrounding air, which is an all-important element in the case. It is a popular fallacy to suppose that water only expands under a rising temperature, with the exception of just at the freezing point, when it expands by crystallisation. Water is at its greatest density at a temperature of 42° Fahr., and it expands quite as much, and continues expanding, as the temperature falls below the standard of density, as it does in the progressive increase of heat above; and to show how weak the "expansion theory" is as applied to the

subject under discussion, it is only necessary to record the significant fact that the expansive force is greater at a temperature of 22° than it is at 62°, and it is less at 52° than it is at 32°. On this matter your correspondent appears to have committed himself to a proposition without due reflection, and I have a very strong conviction that his dictum is absolutely unsupportable.

Another difficulty with many persons is their inability to account for one variety of Grape splitting while others grown under the same conditions remain sound. This was first mentioned by Mr. Thomson on page 402, and it has been alluded to by others. Mr. Kirk (page 434), in adducing strong testimony of the efficacy of the gimlet in preventing the Duke cracking over a period of eight years in a house where a number of other varieties need no such assistance, asks, "What about limiting the moisture in the atmosphere?" Having regard to the condition of the other Grapes, I am not prepared to say that Mr. Kirk did not do what was right under the circumstances, but that is not the question. The question is, Is the Duke of Buccleuch, the Frontignans, Muscadines, and Madresfield Court able to endure as much atmospheric moisture as Black Hamburgs and others without sustaining injury? According to my experience and observation, which together are not inconsiderable, the question must be answered in the negative; and, in my opinion, the difference between the moisture-resisting nature of varieties is due simply to the differing texture of their skins. Why does one variety of Plum or Cherry crack while other varieties near and at the same stage remain sound? The injury can scarcely be attributed to the expansion of the fluids by heat, because this must act equally on all; there is the same moisture in the soil for the roots of all to imbibe, and cracking is no worse in moist than in drier soils, but the skins differ, and the action of endosmose is much quicker through thin than through stout membranes; in fact it is influenced both by the membrane and the nature of the fluids. This anyone may test for himself. Take a thin glass tube, tie a piece of animal or vegetable membrane closely round the end, say a piece of bladder or the skin of a Grape, place thick syrup or brine in the tube, put it in water, and the action of endosmose will be seen by the fluid in the glass rising, the thinner passing through the membrane to the denser. If anyone accustomed to perform delicate chemical experiments should have the means of using, as a membranous covering to the tube, the skins of different kinds and varieties of fruit, he will possibly solve the problem of some fruits splitting while others remain sound. On page 478 Mr. McIndoe gave an interesting example of the fruit of a Governor Wood Cherry cracking through early closing the house with too much moisture; and he asked "If the splitting was not caused by endosmose, then what caused it?" No one has answered him.

I fully intended answering Mr. Henderson's last and very interesting letter, but I have had such a wide field to traverse that I cannot presume to encroach on further space now. All the references apply to pages in the last volume.—A THINKER.

[The publication of this article has been unavoidably delayed.]

ROSE A. K. WILLIAMS.

I HAVE been greatly disappointed in this Rose this season. Few Roses have been offered to the public with such strong recommendations as to general excellency. Every Rose-grower in the country was anxious to possess it. If one wrote to a nurseryman about being supplied with Roses, the strongest reply he could make was that A. K. Williams would be included, and here it is before it has been out more than a year or two turning out inferior everywhere. Some say it is not an A. K. Williams year. I do not believe in this, and hold that a Rose which has been so strongly recommended to us should not fail before it has established its reputation. If it had failed to come up to the standard in the hands of a cottager, amateur, or even a professional gardener, the fault might have been that of inferior cultivation; but when such as Messrs. Paul, Cant, and others show blooms of all sorts and sizes, with hardly a good one amongst them, at such a show as the National, a mistake in culture cannot be raised in its favour.

Having noted its inferior appearance at some provincial shows early in July I was determined to take particular notice of it at the National Show at South Kensington on July 7th, and I was as much disappointed with it as ever. The majority were small and badly formed; indeed, I only saw two good blooms in the whole Show, and they were in the stands of Messrs. Cooling of Bath and Jefferies of Cirencester. I saw one good bloom from Mr. Griffith, Hereford, in his stand at Newport the other day, and out of the scores I have seen shown this season these three blooms were the only ones I could say were really up to a first-class prizewinning type. Those who buy it should, I think, have it as a Rose of ordinary merit, and not as a unique variety in its class, or amongst Roses generally.—J. MUIR, *Margam*.

WESTERN AUSTRALIA:

CORRESPONDENTS are so frequently desiring information respecting suitable fields for emigrants that the following letter from a gentleman holding a high position in Perth, Western Australia, will be of especial interest to many readers. The manual referred to we shall be pleased to forward to anyone sending their name and address, with a stamp for postage:—

"Perth, Western Australia, 5th June, 1885.

"I send you some copies of Mr. Forrest's manual of information about our colony, which I hope will prove of interest to you. The map will show you the vast extent of our territory, the manual the thermometrical range.

"It is positively heartrending to us colonists to see the accounts of labour, skilled and unskilled, running to waste in the mother country. The penny breakfasts furnished to dock labourers are a sad contrast to the abundance in which those dock labourers would revel here could they only be deported hither. The only classes who could not succeed here are the maimed, the halt, the blind, and the dishonest.

"Almost all the Irish peasants who were transported hither for agrarian outrages are now "well-to-do" peasants, and it is a pity that honest English families should not have the same chance."

We may add that the manual gives a map of Western Australia, with full particulars concerning its climate, products, land regulation, railways, and Government, with some interesting statistics for 1884, relating to the prices of provisions, the wages of artisans, with the imports and exports.

THE BLUE PEA (*LATHYRUS SATIVUS*).

Our sketch represents one of the prettiest and most distinct of all the annual Peas of ornamental character. It is an old plant in gardens, and

Fig. 10.—The Blue Pea (*Lathyrus sativus*).

yet we find many of our visitors have never seen it, although it is universally admired by all who chance to see it covered with its clear blue blossoms. Its culture is of the easiest. Seeds sown in drills or clumps in March flower in July, and continue in bloom until late in the autumn. All the attention required after sowing is to stake each clump with a few brushy twigs about 2 feet in height. As shown in the engraving (fig. 10) the 3 to 4-seeded pods are curiously winged along the back. This species has long been grown in S. Europe as a forage plant, but its beauty ought to guarantee it a welcome in all good flower gardens.—F. W. B.

INJURY TO FOLIAGE OF GROS COLMAN GRAPE.

MANY gardeners have been at a loss to understand the reason why the foliage of Gros Colman Grape should become curled and disfigured early in the season. I am not in a position to state whether it has this tendency in the north of England or in Scotland, but in the south it is an acknowledged fact. About Worthing Grapes are grown very largely for market, probably more so than in any other district in England, and whilst there a short time since I paid a visit to Mr. R. Piper's Grape-growing establishment, where Gros Colman is grown very extensively in different houses and aspects, and it is only on one aspect that the foliage of this noble Grape is not affected—viz., on the north side of a span-roof running east and west with broadsides north and south. The length of the house is 350 feet, and width 20 feet. Only two varieties of Grapes are cultivated in the house, which are Gros Colman

on the north side, and Alicante on the south side. On this aspect the Vines receive abundance of light without strong sunshine. Those gardeners who may have a span-roof to plant situated like the above, and who intend planting any Gros Colman, should take the above hint, for the Grape cannot be of such good quality when the foliage has a withered appearance.—A. YOUNG.

ROYAL HORTICULTURAL SOCIETY.

JULY 14TH.

SCIENTIFIC COMMITTEE.—Mr. A. Grote in the chair.

Fungoid Diseases in Fruit Trees.—A communication was received through Sir J. D. Hooker from Mr. T. Kirk, Wellington, New Zealand, asking for advice as to remedial measures. In some districts the fruit trees are being destroyed by the mycelium of a ground fungus—a small Puffball, though the author suspects that several Agarics affect them. When the ravages are most serious the reproductive state is but rarely developed. It first appears as a circular patch, in which all vegetation (as in fruit trees, Oaks, Walnuts, Grass, Sorrel, Strawberry, &c.), is more or less "blighted," the plants exhibiting a withered appearance, the leaves becoming slightly curled, droop and fall long before their time, and the plant dies. The roots are more or less covered with mycelium. The effects extend in a most singular fashion, travelling half way across a garden or orchard from one side only, at others extending in all directions. It is most fatal to fruit trees. It is almost exclusively confined to light soils, on which Fern (*Pteris aquilina*) has grown. Damp or dry soils have no attractions for it. It occurs abundantly in the decaying rhizomes of the Fern, transferring its attentions to fruit trees whenever the opportunity is afforded. The first parts on which the affection shows itself is the juncture of root and stem. The bark becomes absolutely rotten when permeated by the mycelium, and emits a nauseous odour. Plum trees usually show but little mycelium as compared with Apples, but the trunk is more obviously affected, and exudes gum freely. Experiments are being carried out in the following directions:—1, Soaking the soil with tar water and dressing the affected parts with the same. 2, Dressing the soil with soot. 3, With sulphur. 4, With mild brine washes, both for trees and soil. So far the tar water seemed the most effective, but the author was inclined to think that sulphur will have the most permanent effect.

Peach Blight.—The author adds, that in all parts of the country the Peach is dying wholesale, but the cause is most obscure. The trees appear to flower with their accustomed luxuriance, and the fruit to set as usual. If a sudden change of temperature or a severe frost has been experienced during the flowering time, the fruit does not swell, the leaves make their appearance readily and fall quickly—minute orange-coloured blotches are seen on the twigs. These become confluent and black, and then the buds decay. At this stage the plant may die, or if the season prove favourable, a weak autumn growth may be made, and new leaves developed, tassel-like, at the tips of the branches; but a renewed attack the following spring proves fatal, and the plant dies. Plants one year from the seed are attacked as readily as the oldest. Occasionally a tree partially sheltered has suffered less than its neighbour, or has escaped entirely; while two kinds appear to resist the disease more than others—viz., Cornet and Salway, but they are certainly not blight-proof by any means. In the absence of material the members of the Scientific Committee did not feel competent to pass an opinion on the subject.

Poppies. vars.—Mr. Smee exhibited seedling Poppies of *P. Rhæas* with wedge-shaped black patches and white borders at the base; they had originated from the common form.

Amorphophallus (Hydrosme).—Mr. Ridley exhibited a seedling he had raised from a fruit from Gambier.

Abies polita.—Dr. Masters exhibited a spray of this new Japanese Conifer with cones; it was received from Mr. Veitch.

Elms Diseased.—Dr. Masters mentioned the fact of an avenue of Elms fifteen years old, in Guerusey, of which some thirty or forty were rapidly dying. Diseased branches were referred to Mr. Murray for examination and report.

Plants Exhibited.—Mr. Lynch brought from the Botanic Gardens, Cambridge, a fine flowering spike of *Yucca angustifolia*; the anthers appeared to be abortive, and it never set seed. A spray of *Pelargonium Endlicherianum*, from Australia; *Jasminum angulare* var. *glabratum*, a plant new to cultivation, from the Cape; *Nelumbium luteum*, from North America. Dr. Masters exhibited an umbel of *Euryantrum* (*Ferula*) *Sumbul*, remarkable for the acrid and musk-scented juice.

Clover, Virescent.—Mr. Houston exhibited specimens of a not uncommon form, in which the ovules were particularly well developed as leaves.

Potentilla reptans with Uni- to Septem-foliate Leaves.—The Rev. G. Henslow exhibited specimens of Cinquefoil, showing transitoral states from one-foliate leaves, through ternate and quinque-foliate to seven-foliate forms.

Ox-eye Daisy.—Mr. Smith sent specimens in which the ray-florets were tubular, like those of *Centaurea*, and not ligulate, as usual.

Pheasants Poisoned by Fungi.—The following communications were received from Mr. W. G. Smith:—"A week or two ago Mr. Henry Mills, of The Gardens, Enys, Penryn, Cornwall, sent me an example of a fungus which had poisoned pheasants: the gamekeeper had cut open the pheasant's crop, and found pieces of the fungi in them. The birds swell, and are soon dead. On asking Mr. Mills to secure other specimens of the fungi he could not find them, but, strange to say, the pheasants, with superior eyes for such things, found them easily, for other birds died, and pieces were again found in their crops. It is remarkable that sheep and lambs have died suddenly in the same field, as well as in an adjoining field. Whether the sheep have died from the effects of the fungi is uncertain, but sheep will, no doubt, sometimes eat fungi. I have seen sheep eat Mushrooms. I hope to be able to name the species of Agaricus with certainty at the next meeting of the Scientific Committee, as I have just received fresh and better material. I am, however, able to point out the series to which it belongs. It is one of the *Hyporhodii*, or pink spored Agarics, a series limited in Britain to a comparatively small number of species. The Agaric is a small one, about

1 inch in diameter, with characteristic nodular spores. It is probably an *Entoloma*, close to *A. placenta*, *A. helodes*, and *A. repandus*. A close ally of these—viz. *A. sinuatus*, once put me to considerable inconvenience and annoyance."

Resting-spores of *Peronospora pygmaea*.—"A correspondent, Mr. George Brebner, of Aberdeen, has sent me a large supply of the oospores of this *Peronospora* detected by him in leaves of *Anemone nemorosa*. He has also forwarded the accompanying drawing and a microscopic slide showing the oospores *in situ*. In the slide the oospores can be distinctly seen attached to the same mycelial threads as the conidiophores. Mr. Brebner states that Professor Trail has recently lighted on the oospores of *Peronospora arborescens* in the leaves of *Papaver Argemone*. It is a mistake to suppose that oospores of *Peronospora* are rare; they are easily found by competent observers; and when seen on the same threads as the conidiophores—as by me in *Peronospora infestans*, and by Mr. Brebner in *P. pygmaea*—no unprejudiced person can doubt their true nature."

DRUMMOND'S TURF-CUTTING MACHINE.

I HAVE seen the remarks you make in your issue of the 9th July about the turf-cutting machine invented by Mr. F. T. Drummond. As I am, I think, one of the few gentlemen who have seen the machine work, I write to give my testimony to the admirable way in which the machine takes up the turf. It cuts the turf very cleanly both as to length and width and thickness. The last piece of turf that I saw removed by the machine was quite full of Elm tree roots, in spite of which the machine made capital work, and removed in a few hours what it would have taken several men all day to get up. I feel sure the machine has only to be seen to be thoroughly appreciated.—EDW. M. WAKEMAN.

ABOUT THE SURFACE OF SHRUBBERIES.

QUITE lately I had to wait an hour or two in one of our large cities before I could get out of it by train to my destination, and to pass that most weary period of time which I describe under the term waiting I made my way to the well-kept gardens and parks of which its citizens are proud. No expense for labour seemed to be spared. The lawns were in good condition, the shrubs kept neatly pruned to shape, while that greatest of eyesores to a gardener, weeds, were entirely absent. I do not know whether it would be most correct to describe the whole affair as trim or prim. Some people would undoubtedly call it trim, though I must confess the latter term better denotes the effect it had on my mind. This effect was mainly, I may say entirely, produced by the shrubberies. Each shrub was trimmed into shape, and each stood by itself with plenty of space for a few years' free growth in beds, the soil of which was kept hoed and raked. What a difference could be effected at an outlay of a shilling or two and a walk round these shrubberies. With the money a supply of seed of Wallflowers, Foxgloves, Canterbury Bells, Sweet Williams, Poppies, Columbines, and Cornflowers would be procured, and during the walk the supply so bought would be judiciously sprinkled over the vacant ground. Nature would do the rest.

On my way home from the station I passed a little place the whole of which, house, garden, lawns, &c., might have been set down in one of the shrubberies above alluded to. I imagine it would have been impossible to have found as much bare ground in the whole place which one's hand might not easily have covered, and the result is that perhaps as many flowers are grown in the little garden as in the huge public garden, and certainly a greater amount of enjoyment to be extracted from it.

Unfortunately the large gardens are typical of what is to be found in private gardens, and perhaps in small gardens the offence to good taste is the more glaring. It is no uncommon thing to find artificially raised shrubberies in small places, with the shrubs trimmed and a large space of kept ground either bare or covered with weeds throughout the better part of the summer months. The same in a modified degree applies to large places, as in these the shrubs are larger and the weeds do not show so much in the surroundings. But in any case the whole method of shrubbery gardening is wrong. Weeds are an outcome of the attempt to keep shrubberies trim and neat, and that by a process which is almost always a failure. Bare ground in any portion of a garden shows something that should not be, more especially in all kinds of decorative gardening, of which shrubbery gardening ought to be one of the higher forms.

There are three simple methods of keeping shrubberies neat and attractive, the easiest being to cover the ground with grass and keep it cut short during the summer months. This does not entail so much labour as would at first sight appear. The same space of ground can be as rapidly mown with a scythe as hoed, in some cases more rapidly. Where an American mower is kept the labour is greatly lessened, as the matter of three or four runs over the grass during the growing season keeps it in good order. Another method is to plant certain suitable flowers on the grass and among the shrubs. Peonies; wild, Damask, and

other Roses; Foxgloves, Delphiniums, Asters, and many others are very suitable for dotting about in the grass in any open portions. This of course renders the maintenance more expensive. Then the third method is to fill all bare portions as far as possible with flowers. The best plan here is to employ only those that do well under hard conditions of existence. Besides plants already named, Primroses, Polyanthus, Anemones, Doronicums, and many others will do well.

Where shrubs are large and sufficient space is left between each to allow for their development there is nothing like a carpet of grass to cover the ground. Primroses, Hyacinths, Daffodils, Tulips, hardy Ferns, Irises, &c., are all capital for dotting about; the Primroses indeed may be left to carpet the ground themselves. Snowdrops are also very pretty among large shrubs.

Those who may be afraid of much extra work resulting from such methods need not be alarmed on that account. The labour, in fact, is less than in keeping a bare shrubbery clean of weeds in summer and pointed or dug in summer; and at any rate the results are greatly superior, and that in the end is the chief matter.—SYLVANUS.

NOTES AT MANCHESTER.

A SHORT time since I had occasion to visit Manchester, and the selection of an agreeable route became a matter of some importance, for a journey of about 200 miles is rendered much more pleasurable if the scenery be varied and beautiful. I have travelled to Cottonopolis by several routes, but this time I was induced by the representations of friends to try the Midland line, and with great satisfaction to myself. Until Derby is reached there is nothing of a special character to attract attention. The scenery is of the ordinary quiet English rural character, but a few miles beyond that town a tract of land is entered which for sublimity and beauty cannot be surpassed in any part of England. The Peak district of Derbyshire is a famed resort for tourists, and very deservedly has it gained its reputation, for such a diversity of aspect and such an invigorating atmosphere can scarcely be found in Britain without travelling to "bonnie" Scotland. An hour's run through this district presents a charming panorama of lofty hills and deep dales, with numerous small rivers rushing over steep and rocky courses, the land on the higher parts having the peculiar moorland appearance and in others densely clothed with small trees and undergrowth. Through precipitous cuttings, along high embankments, and through numerous tunnels the traveller is rapidly hurried, and he carries with him into the great smoky city of the north a vivid remembrance of a most enjoyable journey.

The time at my disposal did not permit my seeing all that is horticulturally interesting in Manchester, but I was enabled to visit several establishments of some note, the first being the Fern Nursery at Sale. There Messrs. Birkenhead have gradually formed a wonderful collection of the choicest and most beautiful members of the Fern world, and if there are any who do not admire these graceful plants, which is scarcely possible, they would have their opinions greatly altered by inspecting the multitudes of lovely plants at Sale. I have heard people remark that there is a great sameness about Ferns, but this erroneous notion would soon be dispelled by either of the brothers Birkenhead, whose pride in their collection resembles the enthusiasm of amateurs. There is, in fact, an astonishing diversity amongst Ferns, from the delicate gauze-like and diminutive Filmy Hymenophyllums or the hair-like Trichomanes to the giant Dicksonias and Cibotiums, with their expansive shade-affording fronds, there is every gradation. In Palms we have some of the most elegant plants of the vegetable kingdom, but the Ferns surpass all in their winning gracefulness. Fit companions indeed are they for the wonderful and brightly coloured Orchids, and it is not surprising that so many admirers of one family are equal admirers of the other. I enjoyed my visit to the Sale Nursery greatly, and though I should like to point out some of the beautiful Ferns which are there grown, even a moderate selection would occupy considerable space, and would unduly extend my notes. I can only therefore recommend all horticulturists who have an hour or two to spare in Manchester to make their way to the nursery and see for themselves the results of many years' untiring labour.

The headquarters of Manchester horticulture is certainly the Old Trafford Botanic Gardens, for there Mr. Bruce Findlay has succeeded in establishing an annual exhibition which many provincial societies have tried in vain to equal. The Whit-week Show is in its way unsurpassed throughout the kingdom, and both horticulturally and financially has proved for many years all that its most ardent well-wishers could desire. For this alone the Botanic Gardens would deserve a prominent position in British horticulture, as during the long period that these shows have been held very much must have been done to increase the love of horticulture in the district, and the substantial prizes offered have furnished many cultivators with well-merited rewards for their skill. There has also been a steady advance in the collection of plants, and the improvement becomes more noticeable every year. Not only is the number of rarities increased, but their condition is also greatly improved—an item of much importance, for however extensive a collection may be it is never satisfactory if unhealthy plants predominate; still it is not always easy to keep a large mixed collection in good condition, and success is the more praiseworthy.

Another establishment at which I spent a pleasant hour was Pickering Lodge, Timperley, the residence of G. Hardy, Esq., and where an exten-

sive collection of Orchids is grown. The one remarkable feature for some time past has been the plants of *Odontoglossum vexillarium*, which may fairly be considered as amongst the finest in the kingdom. This was well shown by the magnificent group at Kensington recently, and it is doubtful if so handsome a group has ever been staged there before, certainly there was nothing to equal it in merit at the Orchid Conference or the subsequent Orchid Show. Mr. Hardy treats his plants exceedingly well, and they respond to this by making a vigorous growth and flowering profusely, as *O. vexillarium* will do when in proper condition. Another interesting feature at Pickering Lodge is the rock fernery, which has been constructed within the past few years, and which is now becoming well clothed with plants. This is tasteful in design, much varied, and presenting several pretty views, the effect of which is considerably increased by mirrors judiciously placed.

At Brockhurst and Woodlawn, Didsbury, may be seen two remarkable collections of hardy plants, while at the latter place the specimen plants, including Orchids, are becoming noted for their success at the local exhibitions. Ford Bank, also at Didsbury, the seat of Thomas Ashton, Esq., I found well worthy of a visit, for the gardens are very ably superintended by the experienced gardener, Mr. Bailey, and are most commendable for their neatness in every department. Grapes, Peaches, Melons, Cucumbers, Tomatoes, and all ordinary decorative plants are well grown, while outside, the kitchen garden produce and fruit trees are excellent. Ford Bank is, however, pre-eminently noteworthy for its fine collection of Rhododendrons, which is scarcely surpassed by any private collection in the kingdom, either in number of varieties or the luxuriance of the plants. When in flower the numerous beds have a grand appearance, and at the time of my visit there were many in this condition. Hardy plants receive much attention, and several borders are devoted to old and new favourites.

Several other visits were projected, but the time at my disposal lapsed too soon, and I had to reserve several for another occasion.—A VISITOR.

A MISTAKE IN SUMMER PEA CULTURE.

THE recent dry weather has been testing the Peas. Heat will bring out their characters as quickly as anything, and it also tests the best modes of culture, and soon shows the result. On light shallow soil the straw soon becomes yellow, the pods wrinkled, and the peas hard and dry. We recently saw some rows which were in this condition, and the owner could not understand the reason. Plenty of manure had been forked into the surface before the seed was sown, and it was thought they would luxuriate in this, but they did not when the dry weather came. It was then they could not be understood, but in asking about the sowing the matter soon became clear. The drills when opened for the reception of the seed were not deeper than 3 inches; consequently all the most important roots were very near the surface, and although the manure was there it was dried up when the warm weather came, and the result was almost a failure of what might have been a fine crop. In another garden I could not help saying, "What very fine Peas!" "Yes," said their owner, "that is the advantage of deep digging and deep sowing. The ground was trenched 20 inches deep, and the seed was put down 9 inches from the surface." This made the mistake in the other place quite intelligible, and I resolved to practise deep digging and deep sowing for summer Peas. It was a treat to see the deep-sown ones, and the roots being well down from the influence of any drought were growing and fruiting in the most luxuriant manner possible.—A KITCHEN GARDENER.

IN Messrs. J. Veitch & Sons' nursery at Chelsea there is now a handsome display of CARNATIONS AND PICOTÉES fully equal to the best they have had on previous occasions. Thirty beds, each 30 feet long and 4 feet wide, are devoted to the plants, of which there are eighty in each bed. All the best varieties are represented, and some very promising novelties are included, respecting which we shall have something to say on another occasion. During the approaching week the plants will be at their best, and no one interested in these useful and beautiful flowers should miss the opportunity of seeing them.

— PREMIER ROSE BLOOMS.—At the Exhibition of the Moreton-in-Marsh Horticultural Society (affiliated with the National Rose Society) on Wednesday, July 15th, the silver medal of the latter, given as an additional prize for the best stand of Roses, as well as the bronze medal for the best Hybrid Perpetual bloom, was awarded to Mr. W. J. Grant, Ledbury; the bronze medal for the best Tea or Noisette bloom being awarded to Mr. Julius Sladden, Evesham. The bloom selected by the Judges for this distinction in the H.P. class was a splendid specimen of *La Duchesse de Morny*, and that in the Tea or Noisette, *Souvenir d'Elise Vardon*.

— ON a sloping bank near the lake facing the Palm house in the Royal Gardens, Kew, an extensive beautiful bed of *SPIRÆA PALMATA* has been highly attractive for the past week or two, and shows to excellent advantage the good qualities of this *Spiræa* as a bedding plant for massing. The border is 30 feet long and about 6 feet wide in the centre, the shape being a long ellipse, and this is densely filled with plants which are bearing an astonishing number of panicles of bright rose-coloured flowers much darker than they are usually seen. At Kew and many other places in the south of England this *Spiræa* is quite hardy, though it is so frequently grown under glass for early flowering that its value for outside beds is not generally recognised.

— UPON each side of this border a circular bed of *IRIS KEMPFERI*, which is rarely seen in such fine condition; the plants are very vigorous, and the flowers like large *Clematis* blooms 6 to 8 inches in diameter, and of various rich shades of purple and crimson. The secret of success with this *Iris* is planting it where the roots can revel in constant moisture, for the beds named are only a few inches above the water level, and the roots have penetrated into the saturated soil, where they are evidently at home. This hint has been followed up in several establishments, notably at Cambridge, with equal success.

— THE ESSEX FIELD CLUB will hold a field meeting at Witham, Black Notley, and Terling, on Saturday, July 25th, 1885, under the following programme:—The party from London will travel from Liverpool Street station by the 9.3 A.M. train to Witham. Arrive at Witham about 10.15 A.M. Members from other parts of the county will please consult local time-tables and arrange to be at Witham at the hour above stated. An ordinary meeting of the Club (the sixtieth) will be held after luncheon at the "Spread Eagle," Witham, solely for the purpose of proposing and electing new members.

— AN Exhibition will be held by the SCARBOROUGH FLORAL AND HORTICULTURAL SOCIETY in the lawn tennis ground attached to St. Nicholas House, Scarborough, on August 5th and 6th of the present year. Cut flowers, including Carnations, Picotees, and Roses, are specially provided for, but classes are also devoted to plants, fruit, and vegetables.

— THE balance sheet of the YORK GALA AND HORTICULTURAL EXHIBITION in June last has been already issued, and Mr. John Wilson, the active Secretary, and the Committee are to be complimented on their promptitude in getting this done, and showing a substantial balance on the right side. The receipts at the gates amounted to £1398, and with income from other sources the income of the Society for the year was £1794 18s. 7d. The chief items of expenditure are £535 for prizes, &c., £263 for tents, £100 for fireworks, £78 for music, £221 for various amounts, the total expenditure for the year amounting to £1577 15s., leaving a balance in hand on this year's Exhibition of £217 3s. 7d., a goodly portion of which will be handed over to the York charities. From a horticultural point of view also the Exhibition was most successful, holding its own as one of our greatest exhibitions in the country.

— We are requested to state that in the report sent us of the HEREFORD AND WEST OF ENGLAND ROSE SHOW the following meaning was intended in the paragraph referring to new Roses. "This useful and interesting class was not shown as the public ought to see it, several blooms of the same variety being incomparably better shown in the different collections."

— THE WILTS HORTICULTURAL SOCIETY will hold an important exhibition of plants, flowers, fruit, and vegetables in the Bishop's Palace Grounds, Salisbury, August 20th, this year. Good prizes are provided in all the most important of the sixty-seven classes, especially for plants and fruits. To specimen plants two open classes are devoted, in each of which three prizes are offered—viz., £15, £7, and £4; £13, £6, and £3, the former three for flowering plants, and the latter for foliage. In other classes confined to gentlemen's gardeners, the prizes range from £3 to 10s.

— IN reference to the INDIAN AND COLONIAL EXHIBITION OF 1886, we have received the following letter from the Secretary, Major F. Mason—"I am desired by the Council of the Royal Horticultural Society to ask you to allow them to make known, through the medium of your columns, that they are prepared at the request of and in concert with the Royal Commissioners of the Indian and Colonial Exhibition of 1886, to offer their co-operation and assistance to such of the colonies as may desire to avail themselves of it. Some of the colonies

have already expressed a desire to have as a feature of their courts illustrations of the indigenous flora in vestibules or plant houses. In addition to these the Council believe that collections of ornamental and economic plants in a growing state and of fruits would be of much interest and value. The Royal Horticultural Society will be ready to give advice and practical assistance in preparing, arranging, and carrying out such illustrations to any of the colonies who may apply to them. But they desire to point out that it is essential for even a very limited display of growing plants that not a day should be lost. I shall be glad to answer any inquiries. The Assistant Secretary and the Superintendent of the Society's gardens will be ready to meet and consult with the colonial Commissioners, and to take forthwith the necessary steps in conjunction with them."

— THE SHEFFIELD AND WEST RIDING CHRYSANTHEMUM SOCIETY, announce that their first Exhibition will be held in the Corn Exchange on Friday and Saturday, November 13th and 14th of the present year. Eighteen classes are enumerated, and the prizes are substantial in the majority, £5 being offered as the first prize in three classes, with second and third prizes of £2 and £1 each. In other classes they range from £3 to 5s. The Society is under the presidentship of Mark Firth, Esq., and a good working Committee has been formed with Mr. A. K. Woodcock as Secretary.

— Mr. R. I. LYNCH, Cambridge Botanic Gardens, writes:—"The plant figured at page 41 of last week's issue *Journal of Horticulture*, is not *Oncidium vexillarium*, nor is it the one for which my notes were written. It is, I believe, a fine variety of *ONCIDIUM CRISPUM*, but I give this name with reserve, as it was not verified when the plant was in flower. The specimen illustrated came from the Cambridge Botanic Garden, and the spike of which it formed a part was several weeks in beauty. It attracted a considerable amount of attention during the time. The flowers are handsome because of the colour and scolloping of the sepals and petals and lip. The colour is chiefly deep rich brown, indicated by the dark shades of the illustration, and all the parts are margined with yellow, as shown by the light shading. *O. crispum* is a native of the Organ mountains."

— THE schedule of the second annual EXHIBITION OF THE HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY is just to hand, and enumerates forty-four classes, in some of which extremely liberal prizes are offered. The principal class is for forty-eight blooms, twenty-four incurved, not less than eighteen varieties, and the same number of Japanese, in which a silver challenge vase, value fifteen guineas, is offered by the Chairman, George Bohn, Esq., with the first prize of £10. This makes a very handsome prize, the vase going to the employer and the money to the gardener, but the conditions require that the vase should be won twice consecutively, or three times to render it the property of the exhibitor. The second, third, and fourth prizes in this class are respectively £8, £5, and £2, and the Hull Society may therefore claim to have provided the most important class, as regards the value of the prizes, of any society. Another good class for twenty-four blooms, twelve incurved and twelve Japanese, nine varieties of each, is also provided, the prizes being £5, £3, and £1 10s. A silver challenge cup, value five guineas, is also offered for amateurs in local classes, several special prizes being offered by friends of the Society. With such a liberal schedule the Committee have done all that is possible to insure a most satisfactory show.

HORTICULTURAL SHOWS.

MONMOUTH COUNTY SHOW.

THE eleventh annual Show of the Newport and County Horticultural Society was held at Newport on July 16th. The position selected for the Exhibition was Friars Park, Cardiff Road, and it formed a picturesque site. The exhibits were arranged in several large tents and had a very charming effect. On the whole they were above the average in quality of those generally seen at county shows, and Messrs. Lewis & Dixon of the London and Provincial Bank, who jointly perform the duties of Hon. Secretaries in an admirable manner, as well as the working members of the Committee, deserve to be congratulated on the way they have elevated the Society. Several new and important exhibitors came out very creditably on the 16th, but we missed the excellent specimens of one well-known Newport man, Mr. Wattie, gardener to T. Cordes, Esq., of Bryn Glas. Last year, and on many previous occasions, this gentleman surpassed the finest specimens Mr. Cypher of Cheltenham could bring down, and it is a great loss of credit to the neighbourhood that such splendid plants should have been withdrawn from public exhibition.

Plants.—In the class for eight stove and greenhouse specimens in flower Mr. Cypher was an easy first, showing superb examples of *Ixora Williamsii*, *Erica Parmentieriana*, *Allamanda Hendersoni*, *Anthurium Schertzerianum*,

Allamanda nobilis, *Erica Shannonii*, and *Ixora Fraseri*. The second place was taken by Mr. Jones, of Maindee, near Newport, with an extra good specimen of *Clerodendron Balfourianum* amongst other well-grown plants. Mrs. W. S. Cartwright was third with smaller plants. The next class was for six ornamental-leaved plants, and Mr. Cypher took the lead with finely grown specimens of *Cycas revoluta*, *Croton majesticus*, *Latania borbonica*, *Kentia Belmoriana*, *Pritchardia pacifica*, and *Dasyllirion acrotrichum*. Mr. E. J. Grice was a good second, the *Crotons* being particularly well coloured, and Mrs. Cartwright was third. Messrs. J. W. Jones, G. Fothergill, and W. Graham were the winners for six distinct *Achimenes* with fine panfuls. Exotic Ferns were not extra large, but healthy, the prizes for six going to Messrs. T. Wallis, T. E. Watson, and Mrs. Cartwright. Hardy Ferns were clean and healthy, and well shown by Messrs. E. Fowler and H. J. Davis. *Selaginellas* were particularly fine; indeed we never saw them finer, most of them being shown in pans or tubs from 2 feet to 2½ feet across. Mr. W. Graham was placed first with excellent plants of *S. Martensii albo-variegata*, *S. atroviridis*, *S. Kraussiana variegata*, and *S. densa*. Mr. C. T. Wallis and Mr. H. J. Davis followed very closely. Orchids were not numerous, but very good. For six plants in flower Mr. E. Fowler was first with fine varieties of *Cattleya Mendeli*, *C. Gaskelliana*, *Odontoglossum Alexandræ*, *O. vexillarium*, *Cattleya Leopoldi*, and *Cypripedium barbatum*. Mr. T. E. Watson was second. *Caladiums* were large, but not highly coloured. The *Coleus* were very attractive. Zonal *Pelargoniums* were exceedingly attractive. Mr. Cypher had it all his own way in Heaths, his plants being remarkably fresh and beautifully bloomed. The first-prize Cockscombs from Mrs. Steeds, Penarth, were finely grown and excellent in colour. The second-prize plants from Mr. Ingram, Penarth, were dwarfer, but not so fine otherwise. *Petunias* were very showy, and Tuberous *Begonias* were exceedingly fine. Mr. H. Dixon easily secured the first prize in a strong class with dwarf healthy plants bearing many blossoms of unusual size. Mr. W. Powell was second, and Mr. Watson third. In the amateur class for the best arrangement of plants Mr. A. J. Woodcock was first and Mr. J. Pickford second. The last-named gentleman was placed first, as his plants were the finest, but on the arrangement question being reconsidered the cards were changed; but it must be noted that both were highly creditable to the cultivators. *Gloxinias* were rather small and some past their best.

Cut Flowers.—The Roses were the main feature amongst these, and very fine they were. For twenty-four distinct sorts Mr. G. T. Griffiths, Hereford, was first; Mr. W. J. Grant, Ledbury, second; and Mr. Crossling, Penarth, third. The first was decidedly the largest, a bloom of A. K. Williams being one of the finest we have seen this season. The second blooms were fresh and compact, but small generally. The third blooms were even, but rather too far open. In Tea Roses, eighteen distinct, Mr. Grant was a good first; Mr. T. Hobbs, Bristol, second; and Mr. Moore third. The special prizes for twelve H.P.'s offered by Messrs. Cranston, Hereford, brought out a strong competition, and Mr. Grant, Mr. Hobbs, and Mr. Moore won well. *Dahlias* were scarce, but good—one good stand of *Carnations* and a poor collection of *Picotees*. The boxes containing twelve bunches of cut blooms were very attractive, Mr. E. Fowler being first with a grand collection containing many Orchids; Mr. Watson taking second place, and Mr. Crossling third. Hand bouquets were rather heavy, but the flowers arranged in glasses were well done, Mr. Cypher being first, Mr. Jones second, and Mr. Watson third. Wild flowers were scarce and not well put up. Herbaceous flowers were excellent.

Fruit.—For a collection Mr. Coomber, gardener to J. A. Rolls, Esq., M.P., Hendre Park, Monmouth, was an easy first with finely finished Black and Golden Hamburgs, Pine Apple Nectarine, President Strawberry, Scarlet Invincible Melon, and Barrington Peach. Mr. Hawkins, gardener to Col. Turberville, Ewenny Priory, was second with fruit of excellent quality. In black Grapes Mr. Coomber was first with superb finished Black Hamburgs, and Mr. Moore second with the same variety, large in berry, but slightly deficient in colour. In white Grapes Mr. Hawkins was first with good Muscat of Alexandria, and Mr. G. Fothergill second with Foster's Seedling. Peaches were very fine from Mr. Coomber and Mr. Graham, and the same competitors secured the prizes for Nectarines. Strawberries were not very good. Melons were few, and Gooseberries not quite ripe.

Vegetables were of fine quality and abundant. Mr. Moore, Mrs. Cartwright, Mr. Hawkins, Mr. Fothergill, Mr. H. J. Davis, Mr. Graham, and Mr. Watson being the principal prizetakers. The cottagers' tent was well filled with some capital *Fuchsias* and *Pelargoniums* and many grand collections of vegetables.

Messrs. Carter & Co., London; Sutton & Sons, Reading; Francis & Arthur Dickson, Chester; Laing & Co., Forest Hill; James Dickson & Sons, Chester; J. C. Wheeler & Son, Gloucester; Richard Smith & Co., Worcester; Daniels Bros., Norwich; Garaway, Bristol; and Dick, Clarence Nursery, Newport, offered numerous special and valuable prizes, which were evidently much appreciated, as they produced a strong competition in their respective classes.

WINCHESTER.—JULY 16TH.

The largest, richest, and most extensive exhibition of garden products ever held in Winchester was the display briefly to be noticed. Years ago fine shows were held in the old city, but they dwindled away and a great revival has taken place of late. This was the second summer show held under the new directorate, which must be composed of earnest and spirited individuals, or such a liberal schedule could not be arranged and a strikingly meritorious display provided. The redoubtable Mr. Cypher was in strong force from Cheltenham, and won the chief prizes in the classes in which he competed, but not in all of them with the greatest ease, for Mr. Wills, gardener to Mrs. Pearce, ran him closely in the class for six, and Mr. Mould, Pewsey, was an excellent second in the leading class of nine specimens, followed by Mr. James of Norwood and Mr. Wills, whose collections were of equal merit. The plants of the last named exhibitor were remarkably fresh throughout the Show, and he received the leading prizes in the group class with a pleasing arrangement, light yet cheerful, but rather too flat, and for dinner table plants. Mr. Cypher's plants have been described over and over again. Mr. Mould staged a magnificent example of *Ixora Colei*, admirably grown and not over-trained, and *Erica Fairriana* with other good plants. In the amateurs' class for six plants Mr. Molyneux, gardener to W. L. Myers, Esq., Swanmore Park, was distinctly ahead with well-grown

and beautifully fresh specimens, including a *Bougainvillea* of exceptional merit.

The effect groups, of which there were six, were not only the whole of a superior character, the tendency to overpack being very manifest. It could be for no other cause than this that Mr. James and Mr. Hillier were both defeated in the open class. In the smaller amateurs' class there was only one really good arrangement, that of F. W. Flight, Esq., Twyford (Mr. Neville, gardener), and it was almost too like a bouquet, needing the relief of free elegant foliage, the remaining prizes being won by Messrs. Shipley and Symonds.

Roses were distinctly in the ascendant, the display extensive, and the blooms remarkably fine. It is questionable if better stands have been seen this year, especially of Tea-scented varieties. In the open division Messrs. Keynes & Co., were placed first for forty-eight, thirty-six, and twenty-four triplets, followed in the first-named class by Mr. F. and Mr. B. R. Cant respectively; in the second by Mr. C. Turner, Slough, and the Messrs. Cant (equal); and in the third by Messrs. Cooling Son, Bath, and Turner. Mr. F. Cant was first with twelve Teas, followed by Messrs. Hillier, Winchester, and Messrs. Cooling. In the any variety dark class Mr. F. Cant won with a magnificent stand of A. K. Williams, Mr. B. R. Cant occupying the corresponding position in the light class with *Merveille de Lyon*. The best stand of any Tea Rose was staged by Messrs. Cooling with, if we remember rightly, *Souvenir d'Elise Vardon*.

In the division not open to nurserymen there was splendid competition, Rev. R. H. Pemberton, Havering, sweeping the board—that is, securing the leading position in the three classes of twenty-four and twelve H.P.'s and twelve Teas. His blooms were superior throughout, and admirably staged. Other prizetakers in the classes were Messrs. S. P. Budd, Captain Ramsay, and F. W. Flight, who all contributed excellently to the remarkably fine display. The chief prize for herbaceous cut flowers was won by Mr. Molyneux.

The fruit department was well furnished, everything exhibited being good except Melons, and these lacked flavour, as others have at other shows this year. The prizes for a collection of six dishes of fruit went to Messrs. F. Dalgety and W. Baring, the former staging excellent black and white Grapes with a Pine, Melon, Peaches, and Nectarines. Mr. Wildsmith preferred not to win a prize in this class, and his not-for-competition assortment contained splendid Figs, excellent Peaches, and a capital Melon; and in the classes for these fruits he was awarded the chief prizes. Mr. Molyneux staged the best black Grapes—beautiful Hamburgs that would be hard to beat anywhere—followed closely by Mr. Baring with excellent bunches of Madresfield Court, and Mr. Hillier. In the white Grape class Mr. Baring was placed first with Muscats, but Mr. Molyneux's Buckland Sweetwater were dangerously close to them. Mr. Dalgety was third with the ripest of all, but not quite large enough.

There were excellent exhibits of collections of nine sorts of vegetables, the first-prize lot of Mr. Molyneux being quite first-rate; in fact, it would be difficult to imagine better produce. The other prizetakers, and they exhibited well, were Messrs. Dalgety and Baring.

Table decorations and ornaments were of the first order of merit, the first-prize dessert table of Miss Flight being characterised by the high quality of the flowers and fruit, and consummate taste in arrangement; in fact, all were good, Miss Wells and Mrs. Porter winning well the remaining prizes. In drawing-room ornaments the Misses Flight were pre-eminent with chastely arranged stands.

This is necessarily a much-compressed report of what was one of the finest provincial shows of the season, and Messrs. Porter and Colson, with all who shared in its provision and management, deserve unstinted approbation.

CHISWICK SHOW.—JULY 16TH.

VERY satisfactory in all respects was the Exhibition held by the Turnham Green Society in the Royal Horticultural Society's Gardens at Chiswick on Thursday last. The competition was close, and the majority of the exhibits most creditable. There was not, however, so large an attendance of visitors as was desirable, and that is the more regrettable since the Secretary (Mr. Fromow) and Committee had spared no efforts to render the Show thoroughly successful. It is to be hoped that the local supporters will give all the assistance they can, so that the Society may be raised to the position it deserves, as there is evidently good scope for it in the district.

Two large marquees and a large portion of the conservatory were filled with the plants, fruits, and vegetables, but the marquee devoted to the groups and cut flowers was by far the most beautiful, its appearance being greatly enhanced by the soft green well-kept turf upon which the plants were placed. The groups in consequence had an extremely good effect, and they were moreover distinguished by admirable taste in the arrangement. Very seldom indeed are ten such elegant groups seen in competition as those staged in the two classes. In the open class for a group in a space not exceeding 100 square feet Messrs. Hooper & Co., Covent Garden and Twickenham, took the lead with one of the most graceful and well-balanced groups that their manager, Mr. Bruckhans, has ever arranged. There was a due proportion of foliage and flowering plants, and a neatness of finish that was most pleasing. Following closely were Messrs. W. Fromow and Son, Turnham Green, and E. H. Watts, Esq., Devonhurst, Chiswick (gardener, Mr. A. Wright), both of whom had varied and bright groups. The 60 feet groups were scarcely less attractive, and of the six exhibitors F. R. Geaves, Esq., Hatfield House, Cambridge Park, Twickenham (gardener, Mr. G. Tittell), well deserved the premier prize awarded to him for a charming combination of Ferns and flowering plants. E. M. Nelson, Esq., Hanger Hill House (gardener, Mr. Chadwick), and H. G. Lake, Esq., Fairlawn House, Chiswick (gardener, Mr. H. Davis), were second and third respectively, each showing well. Several classes were devoted to specimen plants, but these, though neat and healthy, were not remarkable for size, except in the class for Ferns. With six stove and greenhouse plants Messrs. Bates, A. Wright, and Chadwick were the prizetakers. Mr. A. Wright had the best six *Selaginellas*, handsome pyramidal plants of distinct varieties, and the same exhibitor took first with three *Fuchsias*. Mr. Sallows, Twickenham, was first with *Achimenes*, Tuberous *Begonias*, and *Coleuses*, being followed by several of those already named. Mr. Chadwick had the best six Ferns, large vigorous specimens; Messrs. A. Wright and

Davis securing the remaining prizes with smaller but equally healthy examples. Mr. Chadwick also staged the finest six foliage plants, and was followed by Messrs. Davis and Hooper & Co.

Bouquets were not satisfactory, being heavy and formal, but the stands of flowers were good, especially the three with which Mrs. Hudson, Gunnersbury House Gardens, gained the premier honours, which were the most tasteful we have seen for a long time, and were really faultless.

Fruit was numerous shown, Cherries, Gooseberries, Currants, and Strawberries being especially good. The Grapes, however, with the exception of the two premier prize collections in the white and black variety classes were not quite so satisfactory. Mr. Hudson had the best black Grapes, Madresfield Court, even bunches, large berries, and well coloured; Mr. Band, Homefield Gardens, Ealing, taking a similar position in the white Grape class with Duke of Buccleuch, medium size bunches and berries, but splendidly coloured.

Vegetables were excellently shown, the competition being unusually keen in all the classes. The Society's prizes for nine dishes brought seven exhibitors, Mr. C. J. Waite, Glenhurst Gardens, Esher; Mr. J. Coombs, and Mr. W. Wright securing the awards in that order with fresh, clean, even produce. Eleven competitors entered for Messrs. J. Carter & Co.'s prizes, and C. J. Waite was again the premier exhibitor, followed by Messrs. J. Coombs and A. Wright. Of the nine entries for Messrs. Sutton and Sons' prizes Mr. C. J. Waite was for the third time the champion, thus carrying off three first prizes for vegetables at one show—a remarkable achievement; Mr. J. Coombs being second in each class, and in the last named was followed by Mr. T. Sich.

The non-competing exhibits comprised some magnificent Roses from Messrs. J. Veitch & Sons; Lee & Son, Hammersmith; and Bunyard & Co., Maidstone. Messrs. Lee also having a fine group of ornamental trees and shrubs.

MARECHAL NIEL ROSE.

THE *Marechal Niel* Rose blooms which I sent you some time ago were grown against the wall of a house without any protection. The situation is well sheltered from the north and east, and fully exposed to the south and west. What I consider the chief cause of success is that it is grown in a box and liberally nourished during its period of growth.

Grown thus, with a restricted root space, the wood ripens better than when planted out, and the fine blooms it produces in the early summer will repay for the extra labour caused.—J. MACDONALD.

[We have not seen finer blooms at any of the Rose shows this year than two that were sent to us by our correspondent.]

THE PRESERVATION OF NATIVE PLANTS.

THE Council of the Midland Union of Natural History Societies, including upwards of twenty natural history societies and field clubs in the midland counties, forward us the following statement concerning the desirability of adopting some means of preserving the native flora of Great Britain.

It is a fact only too evident to the most superficial observer that many of our rarest and most beautiful native plants have already been or are being rapidly exterminated; and it may be assumed that this extermination will be viewed with regret—even with indignation—alike by the student and by the ordinary lover of natural beauty, and that both will be willing to assist, by all available means, in any measures which may afford the prospect of arresting its course.

The Council of the Midland Union of Natural History Societies asks serious attention to the following brief statement of the causes of the rapid destruction of British plants, and of what it ventures to suggest as the best means of mitigating the evil.

These causes appear to be mainly as follow:—

First, The ravages of professional plant-hunters, who offer to the tourist or to the general public, by advertisement, plants attractive by reason of their beauty or of their comparative or absolute rarity.

Second, The operations of Exchange Clubs, the members of which are often asked to supply large numbers of the rare plants of their own districts in exchange for corresponding quantities of those of other neighbourhoods.

Third, The indiscriminate or careless gathering of plants, often taken with their roots or in seed, by botanists and their students in the course of botanical excursions.

Fourth, The reckless gathering of large numbers of specimens by individual botanists.

Recognising that restrictive legislation or police interference are neither applicable nor desirable, the Council believes that it is by the indirect influence of example and the promotion of healthy public opinion that the evil in question can alone be combated.

They, therefore, earnestly urge the following considerations upon botanists, members of field clubs, natural history and other scientific societies, upon all lovers of Nature, and upon the public generally:—

First, That they should rigidly abstain from encouraging or countenancing the purchase from professional plant-hunters of any native plants for the sake either of their rarity or of their decorative value.

Second, That botanists should resort to the assistance of exchange clubs, if at all, only for the purpose of obtaining single specimens necessary to fill up blanks in their herbaria, using such assistance with discrimination, and excluding from their operations plants of great rarity.

Third, That all teachers should inculcate upon their pupils, by precept and example, the lamentable consequences of the wholesale or indiscriminate gathering of plants, especially with their roots or when in seed.

Fourth, That individual botanists should seriously reflect on these consequences, and abstain from taking more than the smallest number of specimens indispensable for the purposes of genuine study, and even from taking any where the extermination of a particular species from a restricted habitat is threatened.

Fifth, That tourists and amateurs should be urged to refrain from collecting plants of any degree of scarcity, especially when in flower or seed, it being impossible that 10 per cent. of those gathered under such conditions can possibly live after removal.

Finally, the Council earnestly appeals to the editors of all journals devoted to science and art, as well as to horticulture and floriculture, and to those of the leading London and provincial papers, to assist it in creating a healthy public opinion on this subject by the expression of their sympathy with the effort which the Council is making.

RARE PITCHER PLANTS (NEPENTHES LOWI).

THE other day I heard an amateur observe that, much as he liked *Nepenthes*, there was a remarkable sameness about them in habit of growth and in form of pitcher. Perhaps to some extent he was right, and yet I never see the great collection at Messrs. Veitch's Chelsea nursery without falling in love with these plants over and over again. When well grown, even the commoner kinds, such as *N. gracilis*, *N. phyllamphora* are most elegant but good plants; even small ones, well grown, of *N. Hookeriana*, *N. Mastersiana*, or *N. Khasiana* never fail to attract attention. Apart from their beauty of form and lovely colouring their interest botanically is very great, and Dr. Macfarlane of Edinburgh, who has recently carried on some interesting microscopical examinations of the glandular structure of the pitchers, finds these glands so characteristic that not only native species, but even garden hybrids, could be named with tolerable, even if not with infallible, certainty by the inspection of these glands alone. Perhaps after all there is some little sameness in the pitchers of many kinds, especially since the influx of the American hybrids raised by Mr. James Taplin; but one thing is especially worth remembering—viz, that some of the most remarkable and distinct of all the wild species are not as yet in the hands of ordinary cultivators. One of the most distinct of these is certainly *N. Lowi*, of which we now give an illustration. Its great leathery pitchers are flagon-shaped, and totally different to those of any other known species of Borneo, its native land, although in the Seychelles Islands there is a wild species, *N. Wardii*, which has pitchers somewhat similar but smaller.

Then there is the true *N. villosa*, with downy pitchers as gracefully rounded and as brilliant in colour as a well-ripened Peach; but (after *N. Lowi*) perhaps the most distinct and beautiful of all the unimported *Nepenthes* is *N. Edwardsiana*, pitchers of which have been found over 20 inches in length and of a bright brick-red colour. The above are some of the more remarkable kinds yet to be introduced to our gardens generally, but we already have the noble *N. Northiana* and *N. Rajah* from Borneo, and one or two interesting kinds from Sumatra.

N. Lowi is found at an elevation of about 5000 feet on Kina Balu, in the north of Borneo. It is epiphytal on low-growing trees of *Casuarina*, every branch of which is covered with wet moss and beard-like masses of *Usnea*. The growing points of the long rope-like stems which peep out above the scrubby mass of undergrowth are covered with pitchers, as shown in this little sketch made on the spot. *N. Lowi* was named after Hugh Low, Esq. (now Sir Hugh Low, C.M.G.), who, when Colonial Secretary at Labuan, made the first ascent of Kina Balu, and discovered three or four species of *Nepenthes* and other plants previously unknown. As this mountain is so rich in botanical interest, it is to be hoped that the British North Borneo Company will have it thoroughly explored, seeing that it lies but a few days' journey from their coast stations; indeed, one of the first objects of the Company should have been the formation of a road to, and a health station or sanitarium on this cool mountain side, seeing that without such provision it is well nigh impossible for Europeans to exist permanently in such a uniformly hot and malarious climate.—F. W. B.

PLUNGING PLANTS.

ONLY a few years ago it was a common practice to plunge plants in some moisture-holding material when grown indoors or placed outside during the summer months; but of late years a general system of plunging does not appear to be practised, and I am led to the conclusion that this operation has not found favour with gardeners generally.

As far as indoor plants are concerned this view of the case can be largely supported by a mere glance at the modern structures that have been erected for plants. In these provision for plunging material scarcely finds a place, and stages are substituted of iron and slate capable of holding 2 or 3 inches of sand, gravel, ashes, fibre, or similar material for retaining moisture. That plants can be grown to a high state of perfection without being plunged is fully demonstrated by the splendid examples to be met with in many gardens where plants for decoration are largely grown. Although such results are attained it does not prove that the system generally adopted is the best or the most economical as regards labour. I am of opinion that in most gardens accommodation should be provided for plunging, but the deep pits or beds frequently seen in old houses are not needed. The beds should be sufficiently deep for 8 to 12-inch pots, and if larger than these need plunging the material can be raised above the side of the beds without presenting an untidy appearance.

For the propagating frame plunging material should be provided—I

have found nothing better than sawdust or cocoa-nut fibre refuse—where miscellaneous cuttings are rooted. Those of a soft nature require a good watering after insertion, and then if the pots are plunged in a close frame they rarely require water again until after they are rooted; but for cuttings of Crotons, Dracaenas, Ixoras, Gardenias, and many others a mere sprinkle to moisten the foliage after insertion is sufficient if the

condition of the soil of the plunged plants after their pots are full of roots will be found upon examination to be very similar as regards moisture to what it was when the pots were first filled.

The advantages of plunging the pots may be further demonstrated by reference to the same kind of plants. Plants rooted without watering the soil have been transferred into larger pots, and in several instances

Fig. 11.—SIR HUGH LOW'S BORNEAN PITCHER PLANT (*NEPENTHES LOWI*, Hook. fil.)

soil is in a satisfactory state when the pots are filled. These cuttings should be inserted singly in small pots, and if plunged cover the pots and surface of the soil with the material used; they will need no water until they are rooted. Cuttings treated on this system will fill their pots with roots by the time others watered in the ordinary way and stood upon the surface of the plunging material commence the formation of roots. The

repeated a second time, and have filled their pots with roots before water was given them. I believe it possible to shift plants until they are of a large size before it is necessary to apply water to the soil. Evaporation is arrested by this simple process, and the soil in the pots will remain in an intermediate state of moisture for a long time, which is the most suitable condition that can be maintained for encouraging the formation

of roots in the first instance and their rapid development afterwards. Regularity as regards both heat and moisture is thus obtained, and all who try this system of plunging will be surprised how rapidly the plants fill their pots with roots.

Plunging plants indoors has probably fallen into bad repute more through the careless manner in which they have been watered than from any other cause. But when this has taken place the pots have been plunged to their rim, only the surface of the soil being exposed to the sun and atmosphere of the house. In plunging plants the rim of the pot should be covered at least 1 inch below the surface, and then no mistakes need be made in the supply of water, for it is reduced to a very few applications. Soil for potting should always be in an intermediate state of moisture, and when used in this condition and the plants plunged after potting no water will be needed for at least a month even during hot bright weather. On several occasions Eucharises have been shaken out, repotted, and plunged, and they have filled their pots with roots before it proved necessary to give them water. Gardenias and other plants have been treated in the same way, and in each instance the most successful results have followed.

Phaius and Calanthes are often ruined in their early stages by too much water. In this case it can be remedied by plunging and covering with fibre directly they are potted. This can be done without the slightest injury to the young growths that are springing from the base of the pseudo-bulbs. When potted singly this is simple, for the pseudo-bulbs can be slightly elevated in the centre of the pots that are used. Under this system the plants will be rooting freely before it is necessary to give them water, when liberal supplies do them no harm.

For plants that have to occupy outside positions during the summer months a judicious system of plunging should commend itself to all who care for the health of the various plants under their charge and wish to economise the labour at their disposal as much as possible. Hardy flowering shrubs that are prepared for forcing and kept in pots from year to year can be grown to very great perfection with comparatively little labour in watering if the pots are plunged instead of being stood upon walks and beds of ashes and watered daily, and often more frequently during hot dry weather. Last year Lilacs, Guelder Roses, and similar plants were cut back, top-dressed, and plunged in the ground, covering the pots, and we found it unnecessary to water them during the whole summer. They were not even syringed, and they made strong sturdy growth with abundance of large hold flower buds. Roses in pots may be plunged in the same way, and one or two soakings of water during the remainder of the season will prove ample, no fear being entertained that they are suffering by the want of water. Whenever plants stood on the surface of walks with their pots exposed we found the soil dried too quickly, and they soon became a prey to mildew. Last year we partially reduced the balls of our Hybrid Perpetual varieties in July, and replunged them in ashes without giving water, and none was applied until after the plants were housed, pruned, and ready for starting. The pots were full of roots, but a number of plants that were not plunged had to be watered many times during the season, and did not make more than one-third the quantity of roots by autumn. The advantage of plunging is very marked in the case of Roses, for plants lifted towards the end of October, repotted, and then plunged, will fill their pots with roots if the foliage is kept healthy by syringing, but plants potted at the same time and stood upon walks, even if the same care is taken to maintain the foliage, will not make more than half the quantity of roots. Solanums and other similar plants that are grown in pots will not give half the labour in watering if the pots and surface of the soil are covered in ashes or soil, as will be the case if plunged only to the rim of their pots or stood upon the surface of beds of ashes. Plants of this description often root over the sides of their pots, but when lifted in autumn the removal of these roots will not prove injurious to the plants if they are kept moist and shaded for a few days.

That this system is a safe and a reliable one as regards the majority of plants is proved by the fact that in large nurseries hundreds of thousands of plants are plunged in the manner described. The enormous quantity of plants grown in pots in large nurseries for removal with safety at any season of the year could not be supplied with water without a very large increase in the labour staff. Not only is plunging as described a labour-saving practice, but it insures safety against a common evil arising from a too frequent use of the water pot. This is probably the chief cause why many plants are unsatisfactory. When plants are potted and stood upon walks with their pots exposed, judgment and the greatest care is essential, or else too much water will be poured into the soil before the roots have taken full possession of it. The roots of plants, whether stove, greenhouse, or hardy, will not enter soil freely that has been saturated. It is a well-known fact that the longer plants can be kept without water after they are potted the sooner the roots recover from the injury they have received.

When plants are grown indoors and plunged exposed to the sun, they should be freely syringed at least twice daily during bright weather, and the plunging material should also be kept moist or it will draw the moisture out of the soil. If the material is moist when the plants are plunged the daily syringings will keep it so.—Wm. BARDNEY.

HALES' EARLY PEACH.

SOME time ago I sent you a note in favour of this grand Peach, and another season's experience of it fully confirms all my former good impressions. Growing at the coolest end of a cool unheated house it set a capital crop of fruit in the fore part of April, and in three months after

wards—i.e., the 1st of July—we were gathering fine ripe fruits of it. They swelled to a good size, were of a high and beautiful colour, and excellent in flavour. Prince of Wales and Royal George Peaches growing in the same house are three and four weeks behind it in ripening, and they have the advantage of being nearer a heated vinery. For market work or an early crop anywhere this variety could not, in my opinion, be surpassed. It grows so freely, fruits so profusely, and ripens the crop so fast and well, that I can recommend it as a most desirable early Peach. That skilled fruit-grower, Mr. Coleman of Eastnor Castle, when here the other day, told me he knew of its good qualities, and speaks of it in much the same terms as I have done.—J. MUIR.

LONDON'S LESSER OPEN SPACES—THEIR TREES AND PLANTS.—No. 2.

WHICH churchyard was it "between Gracechurch Street and the Tower," where Dickens came one Saturday evening upon an "old, old man and an old, old woman" engaged in the work of tossing hay? "Gravely among the graves," says he, "they made hay all by themselves; there was but one rake between them, and they held it in a pastorally loving manner; there was hay on her bonnet, as if the old man had recently been playful." Possibly the small product of hay was destined for some old, old horse lodged not far off, and a favourite with the worthy couple. If the spring has been showery we may see grass long enough to make hay in several of the City churchyards, but some show only a poor, sickly growth, arising from confined air or the impoverished character of the soil. Passers along the great thoroughfares of London City know little about these relics of the past, shut in very often by tall buildings, each having a history of its own, and many of them looking cheerful some part of the year with their trees, shrubs, and even flowers. It is a pity that, under suitable regulations, they cannot be thrown open to those clerks or warehousemen who toil close to them in rooms close and oppressive during the summer season, and who might thus take a rest at their meal times instead of munching sandwiches in the streets or getting a glimpse of these green spaces through the outside railings.

Surveying these gardens of the dead, which have ceased to be repulsive, one notices the absence of some trees that it would be natural for us to expect to see in their precincts. Funeral trees of any age are not to be met with; it is strangest to miss the Yew, because it was so commonly planted in churchyards by our ancestors. Did the zealous Puritans of the seventeenth century cut down the City Yews as associated with Popery, or did they perish through the demand for bow-wood? Then certainly London formerly had many Elms in its gardens and roads about the City; they are now merely represented by a few stumps, brought low, probably by that troublesome beetle, *Scolytus destructor*; yet it is possible that internal decay precedes the attack of the insect. It may not be out of place to remark in passing that modern observation of the Elm suggests that it is not a tree suitable for planting in much-frequented thoroughfares, because it has a habit of throwing off branches suddenly. Willows would not be likely to flourish in London at this present day, but these trees did once grow freely in several City churchyards, when there were springs occurring on the sides of its little hills to refresh the arid soil. Seldom do we come across a Hawthorn larger than a bush, and though I doubt not the Ash, Maple, and Horse Chestnut would do well even in the air of central London, these do not appear to have been planted in former times.

St. Paul's Cathedral churchyard, we are glad to say, is now open to the public, having been laid out at the expense of the Corporation of London, and large as is the number of its daily visitors, and varied their social position, the conduct of all is reported as "excellent." There are seats, fountains, beds of flowers, and shrubs, and it was satisfactory to notice that some of the visitors at least occupied themselves in observing what was growing, while to others the animal life in the garden, exhibited by pigeons and sparrows, furnished amusement. As we read, this churchyard was, centuries ago, very shady with trees; some large ones were blown down in a great gale of the year 1611. The few trees now of size are Sycamores, standing irregularly on the north side of the ground; but some saplings have been planted recently, judiciously distributed, so that they will not be likely to check the growth of flowers beneath them. A preference seems to have been given to Birches and Poplars, trees suitable for the garden, because they do not throw much shadow from their foliage. In a spot that has been a churchyard we cannot object to the presence of one or two Yews amongst other evergreens; but I always think this species is best either as a hedge, or placed solitary. Some evergreens do exceedingly well in the London atmosphere; Conifers, however, are seldom successful, so far as I have seen. The Aucubas and Laurels of St. Paul's compare favourably with those growing in other London churchyards. Unless carefully tended the evergreens of town gardens are liable to pass into a peculiar condition of existence; they still put forth leaves, but make no growth, remaining stunted year after year. Varieties of the Box were, to my surprise, freer from scale than in the open suburbs. This species needs to be well syringed during mild weather in spring, a matter often neglected both in gardens and shrubberies. Positively, the old Cathedral in leafy June could look down upon flowering Camellias and Rhododendrons, with a fair display of Liliaceous flowers of later spring, and gardeners were busy bedding-out. I cannot say I admire the plan of giving some beds a large centre of evergreens, and then edging them with a small circle of Pelargoniums, Calceolarias, and so forth. Nor do I think it advantageous to fill occasional beds entirely with Ivy, which may be agreeable to the eye throughout the year, but is apt to form a place of hiding for snails

and some insects. A practice not uncommon in public gardens is that of sowing annuals here and there in small patches amongst plants of smaller growth, but they seldom come up well then. Some annuals, hardy and half-hardy, succeed in the air of the metropolis, yet only if they have plenty of light, and they need very assiduous watering. When I saw examples of the Monkshood conspicuous in some of the beds of this garden, I was reminded of the reply given to some querist who wanted to know how to manage the Monkshood, "The best way to manage it is to pull the plant up and burn it." And, seriously, the Aconites are so poisonous, not only in their roots, but in their leaves and flowers, that for the most part they are best excluded from gardens of common resort.

Amongst the small City churchyards that are open to the public is that of St. Catherine Colman, close to Fenchurch Street. It is of interest for some reasons, though the church is not old, having been rebuilt in 1734. Limited as is the open space now, the generally accurate Stow informs us that the second name arose from a large haw garden near the church, called "Coleman-haw." What was a haw garden of the olden time? Certainly not a place planted chiefly with Hawthorn. So far as we can tell, people meant by it a garden enclosed or hedged round. The Saxon "haw" came to be applied to the Maybush or Whitethorn because it was found very suitable for this purpose. There are no trees of any size in this churchyard, but young Limes are growing well, upon one of which I was pleased to detect some caterpillars of the vapourer moth, an insect that is one of the few to which a City life is quite as agreeable as one in the open country. Hawthorns are here, too, scarcely descended from those which may have grown hereabout in days of yore, Laburnums, and a few evergreens and flowers. Odd plants turn up in some of the old churchyards; thus in the little plot of St. Gabriel's, off Fenchurch Street, with fine tall Sycamores, some tendrils of Hop were creeping along the railings, apparently self-sown. In the churchyard of St. Lawrence, Poultny (which still remains undisturbed, though the church was not rebuilt after the great fire) the Strawberry-leaved Trefoil was growing on one of the graves, trying to live in London air. This plot is well planted with flowers and shrubs, the trees are Limes and Sycamores, as is frequently the case. At their roots the London Pride (*Saxifraga umbrosa*), appears to be quite at home, but sundry Ferns that have been introduced look languishing. Fierce is the roar of life around the churchyard of Allhallows in Thames Street, and wise probably the regulation which keeps this place closed to the public, or it might become too full of the habits of the adjacent Billingsgate. Here are two fine Sycamores, and many shrubs. Flowers are not wanting either, though it is found needful to cover the choicest with wire frames to protect them from the cats. For it is a fact some do not know that cats are numerous in the busy districts of central London, encouraged of necessity as an antidote to the prolific and all-devouring rats.—J. R. S. C.

ROSE SHOWS.

CHRISTLETON ROSE SHOW.

JULY 14TH.

"Well done Christleton!" was the mental observation of many who surveyed the well-filled tent in the Lawn Field, Christleton, on the above date, for it is a happy surprise to find such a splendid Exhibition. The Roses were, as a whole, simply grand. Nowhere have finer blooms entered the friendly strife than many staged in the amateurs' classes. That redoubtable exhibitor, T. B. Hall, Esq., Rock Ferry, came out in his very best style, and as the awards will show carried all before him; and well he might, for his flowers were first rate. The National Rose Society's Show at Manchester the previous Saturday did not include such blooms, and we may say almost as much for those staged by W. J. Grant, Esq., of Ledbury, perfect in colour and finish, but not so large as Mr. Hall's. The Show was much better in every respect than upon any previous occasion. This is undoubtedly due to the keen interest taken in the affair by the Rev. Lionel Garnett, he himself being a most enthusiastic grower and successful prizetaker. He, too, is well assisted by the good and genial Secretaries, Messrs. Weaver and Earlam.

Another very remarkable and interesting feature was the wealth of hardy herbaceous flowers, staged in great abundance and variety. They were extremely showy and much admired. Great interest centred in the collection from Edge Hall, Malpas, arranged by the Rev. C. Wolley Dod, the best of which are noticed below. The large number of exhibits in the competing classes and their general excellence was very gratifying—a good reward again to Mr. Garnett, who is very wishful to encourage the culture of such flowers in his district. The first prize for the best H.P. Rose in the amateurs' classes was awarded to A. K. Williams in Mr. Hall's stand, although we could have wished it had been bestowed upon a grand bloom of Duke of Teck in the same exhibitor's stand of eighteen. Mr. Hall also secured first prize for the best Tea Rose, which certainly merited it. The weather being gloriously fine a large number of the public availed themselves of the opportunity of admiring the queen of flowers.

NURSEYMEN'S CLASS.—There was only one provided in this section—viz., for thirty-six distinct, single trusses. Two stands were staged, both of which were good, indeed many of the flowers were superb. The first honours were awarded to Messrs. F. & A. Dickson & Sons, Upton Nurseries, Chester, followed by Messrs. James Dickson & Sons, Newton Nurseries, Chester. The leading collection contained excellent flowers of the following:—Back row—Charles Lefebvre, grand; Etienne Levet, Lady Mary Fitzwilliam, Comtesse de Morny, splendid; Louise Peyronney, very large; Elie Morrel, a grand bloom; and Marquise de Castellane. Middle row—François Michelin, Capt. Christy, La France, Queen of Queens, Sir Garnet Wolseley, very fine. Front row—Duc de Rohan, Duchesse de Caylus, and Madame Victor Verdier. The second lot contained many splendid blooms, amongst which were the following:—La France, magnificent; Madame

Montet, Duke of Teck, an extraordinary flower; Ulrich Brunner, Baroness Rothschild, Maria Baumann, Etienne Levet, Madame Eugène Verdier, Xavier Olibo, grand; Madame Chas. Wood, Comtesse de Serenye, and Madame G. Luizet.

AMATEURS' CLASSES.—The leading one was for twenty-four distinct varieties, in which four very superior collections were staged, better than which we have not seen this season, especially those belonging to T. B. Hall, Esq., and W. J. Grant, Esq. The premier award fell to the first of these exhibitors, in whose stand there was not a weak bloom. The following were shown:—Back row—Dr. Andry, Merveille de Lyon, A. K. Williams, François Michelin, La France, Xavier Olibo, Captain Christy, Ulrich Brunner, fils. Middle row—Marie Verdier, La Havre, Violette Bouyer, Charles Lefebvre, Marie Baumann, Marie Finger, Duke of Edinburgh, Duchesse de Vallombrosa. Back row—Louis Van Houtte, Marquise de Castellane, Madame Victor Verdier, Innocente Pirola, Duke of Wellington, Comtesse d'Oxford, Etienne Levet, and Prince Arthur. Mr. Grant's stand included a very large per-centage of first-class blooms; special mention may be made of the following:—Constantin Tretiakoff, Star of Waltham, Madame Sophie Fropot, Dr. Andry, Horace Vernet, A. K. Williams, Mrs. Jowitt, Duke of Wellington, and Mons. E. Y. Teas. The third prize fell to the Rev. L. Garnett, Christleton, who had excellent flowers of Comtesse d'Oxford, François Michelin, Madame E. Verdier, Marie Baumann, La Havre, Alfred Colomb, and Louis Van Houtte. For eighteen distinct varieties Mr. Hall again took the lead with another magnificent stand as follows:—La France, Dr. Andry, splendid; Merveille de Lyon, Général Jacqueminot, Capitaine Christy, Marquise de Castellane, Prince Arthur, Madame Eugène Verdier, A. K. Williams, Innocente Pirola, Marie Baumann, Xavier Olibo, François Michelin, Lord Wolseley, magnificent; Marie Verdier, Duke of Teck, an unusually good bloom; Magna Charta, and Le Havre. Rev. L. Garnett took the second, the best being Madame Gabriel Luizet, Etienne Levet, Charles Lefebvre, Baroness Rothschild, Marquise de Castellane, A. K. Williams, and Madame Victor Verdier. Third Mr. Grant, Ledbury. In the class for twelve trusses of any light variety there were six stands staged, Mr. Hall taking the first position with magnificent blooms of Marie Finger, which for finish and colour could scarcely be beaten; the second fell to Mr. Grant for a rich stand of La France. For twelve any dark variety Mr. Hall was again first with a perfect stand of Marie Baumann, large, full, and splendidly finished blooms; followed by Mr. Grant with Alfred Colomb: two others were staged, Louis Van Houtte and Le Havre. For twelve distinct varieties, section C, W. E. Hall, Esq., Bebington, was a good first with an excellent stand; the best flowers were Marquise de Castellane, Horace Vernet, Prince Arthur, Marie Baumann, and Marie Finger. The second and third fell to Col. Standish Hore, St. Asaph, and Mr. Weaver, gardener to Mrs. Townshend Ince, Christleton Hall, respectively. In the corresponding class for six varieties there were six lots staged, the first falling to C. K. Hall, Esq., Oxtou, with Marquise de Castellane, Merveille de Lyon, Captain Christy, Etienne Levet, Marie Baumann, and Madame G. Luizet. Second and third to Col. Stanish Hore, and Mrs. Townshend Ince in the order named.

Tea and Noisette Varieties.—For twelve varieties T. B. Hall, Esq., took the lead, staging in his usual style—not a weak bloom, but first-class flowers of the following: Anna Ollivier, Marie Van Houtte, magnificent; Souvenir d'Elise, Alba Rosea, Catherine Mermet, very rich; Innocente Pirola, grand; Jean Ducher, Comte de Paris, Madame Margottin, Madame Lambard, Madame Willermoz, and Francisca Kruger. This last was awarded an extra first prize as the best Tea Rose in the Show. It is a scarce kind, and in this case was shown in excellent condition. The second fell to J. Grant, Esq., who had excellent flowers of Madame Lambard, Caroline Kuster, Anna Ollivier, and Rubens. For six varieties Rev. L. Garnett took the lead with a pretty stand of Bouquet d'Or, Innocente Pirola, Comtesse de Nadaillac, and Madame Lambard. The second fell to W. E. Hall, Esq., Bebington, with a nice stand.

District-grown Roses.—For six trusses the first fell to Mr. D. Large, Christleton, with a good lot—Abel Carrière, La France, Xavier Olibo, Baroness Rothschild, Duke of Wellington, and Duke of Edinburgh; second, C. W. Townshend, Esq., Trevallyn; third, Mr. John Walker, Waverton. Several other small classes were well filled in this section, a sure indication of the interest taken in Rose-growing in the district.

HARDY FLOWERS.—These were a most important and attractive feature—indeed, it was impossible to see a finer lot. For a collection of not more than thirty-six varieties the first was taken by F. N. Garnett, Esq., Wyreside, Lancaster, with a very gorgeous collection, the best of which were Phlox Mrs. Hunter, Campanula grandis alba; Delphinium Cantab, a large light blue variety; Lilium croceum, Dictamnus Fraxinella, Centaurea Marshalliana, Onosma taurica, Campanula pelviformis, Rosa rugosa, Gaillardia grandiflora, Pyrethrum Boule de Nieve, Iris xiphoides, a splendid form; Campanula glomerata, Gladiolus The Bride, Bahia lanata, and Pink Mrs. Sinkins. Rev. L. Garnett was second with an excellent collection, the best of which were Phlox Lady Napier, Gladiolus insignis, Campanula persicifolia, Alstroemeria Hookeri, a charming species, richly coloured; Sweet Sultan, Papaver nudicaule in variety, very attractive; Harper Crewe's Doronicum, Campanula Hendersoni, Scabiosa caucasica, Gladiolus The Bride, Achillea serrata fl.-pl., and Catananche cerulea. For a collection of not more than twenty-four varieties C. W. Townshend, Esq., was first, and Mr. Weaver, gardener to Mrs. Townshend Ince, Christleton Hall, second, although we failed to see why the second was not placed in the premier position, as it was much the showiest. The best in Mr. Weaver's lot were Gladiolus Colvilli and its white variety The Bride, Delphinium grandiflorum pl., magnificent spikes; Spiraea palmata, Chrysanthemum segetum, Lychnis vespertina fl.-pl., and Spiraea palmata elegans. The best in the leading lot were Delphinium Herman Stenger, Acanthus latifolius, Erigeron speciosum, Linum flayum, Achillea Eupatorium, and Delphinium nudicaule. The first prize for the best hand bouquet of Roses dressed with Rose foliage and Ferns only fell to T. R. Fleming, Esq., Rowton Grange, for a very handsome one.

MISCELLANEOUS EXHIBITS.—A very fine lot of hardy herbaceous and bulbous flowers was staged in two boxes by Messrs. James Dickson & Sons, Chester, all showy kinds—Delphiniums in variety; Lilliums, including pardalinum and Michauxii; English Irises in variety, Crinum capense varieties, Ranunculus Fireball, Lathyrus grandiflorus, Lilium longiflorum,

Ranunculus Mont Blanc, a splendid white variety; *Alstroemeria aurea*, *Spiraea Aruncus*, *Aquilegia chrysantha*, &c. Messrs. F. & A. Dickson showed some fine *Merveille de Lyon* Rose and a nice selection of stove and greenhouse plants. The Rev. C. Wolley Dod staged a very rich and effective collection of hardy flowers, many of which are scarce. Conspicuous was a grand flower of the Horned Poppy, *Romneya Coulteri*, a large pure white flower quite 6 inches across, with a large tuft of yellow stamens: it is really a very fine plant; *Erythrochaeta palmatifida*, *Anthemis tinctoria alba*, very pretty; *Iris sordida*, *Scabiosa caucasica*, a fine blue *Scabiosa*; *Lilium Martagon album*, an immense spike; *L. pardalinum*, *Orchis foliosa*, *Papaver Hookeri*, *Spiraea Aruncus*, *Dictamnus fraxinella*, *Campanula rotundifolia* in variety, showing a great difference in form and size; *Ligularia macrophylla*, the rare blue Poppy (*Meconopsis Wallichii*), *Aster Bigelovii*, *Onosma taurica*, *Rosa rugosa*, and *Phlox Lady Napier*, a splendid white early-flowering *Phlox*. A splendid stand of Roses was staged by T. B. Hall, Esq., which did great credit even to that redoubtable exhibitor.

CRAY VALLEY AND SIDCUP HORTICULTURAL SOCIETY.

JULY 11TH.

THIS, the first Exhibition of this Society, brought together a capital exhibition of Roses, and the National Rose Society is to be congratulated on what is to all intents and purposes a new Rose Exhibition in the Cray district. The prizes offered were liberal, and brought to Sidcup some of the leading trade growers. The Show was held in the grounds of Sidcup House, the residence of the Rev. R. M. Berens; and though plants, fruit, and vegetables were included in the schedule of prizes, Roses were the leading, and a very good feature too.

In the all-comers' division were four classes, and that for forty-eight varieties of Roses, distinct, single trusses, brought five competitors; Mr. B. R. Cant, Colchester, being placed first with beautiful blooms, including Duke of Teck, Général Jacqueminot, Madame Hippolyte Jamain, Louis Van Houtte, Mrs. Jowitt, Innocente Pirola, Fisher Holmes, Lady Sheffield, Marguerite St. Amand, Souvenir d'Elise, Madame Cusin, Madame George Paul, Maréchal Niel, François Michelin, Madame Welch, Catherine Mermet, Camille Bernardin, and Miss Edith Gifford. Messrs. Paul & Son, Old Nurseries, Cheshunt, were second; their best flowers being Xavier Olibo, Star of Waltham, Mons. E. Y. Teas, H. Schultheis, Alfred Colomb, Boieldieu, Beauty of Waltham, Duc de Rohan, Jean Ducher, the pretty striped Pride of Reigate, Queen of Queens, Niphetos, &c. Third, Mr. W. Rumsey, Waltham Cross. The best twenty-four blooms, single trusses, were staged by Messrs. G. Bunyard & Co., Maidstone, who had very nice fresh examples of Star of Waltham, Etoile de Lyon, A. K. Williams, Jean Ducher, Madame Lacharme, Marie Baumann, Alfred Colomb, Richard Laxton, Dupuy Jamain, S. R. Hole, Charles Darwin, and Maréchal Niel. Mr. B. R. Cant was a good second, staging good blooms of A. K. Williams, Countess of Rosebery, Maréchal Niel, Le Havre, Duke of Teck, Merveille de Lyon, Prince Arthur, Louis Van Houtte, Star of Waltham, Miss Edith Gifford, Innocente Pirola, and Catherine Mermet. Third, Mr. W. Rumsey. The class for twelve varieties of Teas and Noisettes brought a good competition, and here Messrs. Bunyard & Co. were again first, having excellent examples of Perle de Lyon, Madame Bravy, Jean Ducher, Etoile de Lyon, Maréchal Niel, Madame Hippolyte Jamain, Jean Pernet, Perle des Jardins, Homère, Catherine Mermet, and Souvenir de Paul Nerou. Mr. B. R. Cant came in second, staging some fine blooms of Catherine Mermet, Miss Edith Gifford, Caroline Kuster, Etoile de Lyon, Devoniensis, Innocente Pirola, Madame Cusin, and Rubens. Third, Mr. W. Rumsey. In the class for six trusses of one variety there was a spirited competition, the first prize going to Mr. Cant with a half-dozen medium-sized, finely coloured, and symmetrical blooms of A. K. Williams; Messrs. G. Bunyard & Co. being second with Marie Baumann, and Mr. W. Rumsey third with Merveille de Lyon.

In the amateurs' classes Mr. Fuller, The Vicarage, Bexley, was placed first with twenty-four varieties, single trusses, and the silver medal of the National Rose Society was awarded in addition. This was a good stand, the leading flowers being Alfred Colomb, Dr. Andry, Marie Baumann, Charles Lefebvre, Etienne Levet, Madame Victor Verdier, Charles Darwin, and Marie Rady. Second, G. T. Ongley, Esq., Eltham. Third, A. Harris, Esq., Eltham. Mr. Fuller was also first with twelve varieties having a good lot of flowers, the leading examples being Charles Lefebvre, Madame Hippolyte Jamain, Duchesse de Caylus, Etienne Levet, Etoile de Lyon, Marie Van Houtte, Alfred Colomb, and Mrs. Baker. Second, the Rev. T. N. Rowsell, Eltham. Third, A. Bryan, Esq., Foots Cray. Mr. Fuller also had the best six Tea and Noisette Roses, staging Madame Lambard, Innocente Pirola, Rubens, Souvenir d'Elise Vardon, Anna Olivier, and Catherine Mermet. Second, G. T. Ongley, Esq., with good blooms of Innocente Pirola, Laurette, Perle des Jardins, Madame Berard, Souvenir d'un Ami, and one unnamed. Third, the Rev. J. N. Rowsell.

The bronze medal of the National Rose Society was awarded to the Rev. J. N. Rowsell for the best single specimen Rose not shown in a collection, he having staged Etoile de Lyon in good condition.

Among honorary exhibits, Messrs. Geo. Bunyard & Co. staged cut specimens of old-fashioned Roses, and a very interesting group of varieties of the Moss section.

OXFORD.

THE annual Exhibition of this Society was held on Thursday, the 9th inst., by kind permission of the High Sheriff of Oxfordshire (Lieut.-Col. George Herbert Morrell), in the pleasure grounds of Headington Hill Hall in conjunction with the annual inspection and competition of the Oxford Volunteer Fire Brigade. The Oxfordshire Bee-keepers' Association also had a tent erected at a convenient distance from the Rose Show. The High Sheriff having generously contributed to the Rose Society a sum corresponding with their takings at their last meeting in these grounds on the condition that after three o'clock there should be free admission, it is not at all surprising that the attendance was largely in excess of any former Exhibition. It was computed that no less than 10,000 persons availed themselves of the privilege so graciously accorded to them. The grand display of Roses were arranged in a well-ventilated marquee 140 feet long and 40 feet wide, and presented a charming *coup d'œil*.

In the most important classes—those open to all England—the competition was keen, and the quality of the flowers generally of a high standard.

In Class 1, for forty-eight distinct varieties, three trusses of each (as it reads in the Society's schedule of prizes), the first prize was awarded to Mr. Charles Turner, Slough, for an effectively arranged stand of very fine blooms, amongst the most noticeable being Lady Mary Fitzwilliam, Heinrich Schultheis, Niphetos, Royal Standard, Marie Baumann, Mdle. Marie Rady, La France, Ulrich Brunner, Duc de Montpensier, Merveille de Lyon, Madame Victor Verdier, Devienne Lamy, François Louvat, A. K. Williams, Etoile de Lyon, Madame Gabriel Luizet, Duke of Edinburgh, and Louis Van Houtte. The second prize was gained by Mr. J. Mattock, New Headington, Oxford, with beautifully fresh-looking flowers, that so wonderfully improved under canvas as to occasion remark. The third prize was awarded to Messrs. Curtis, Sanford & Co., Torquay.

In Class 2, for forty-eight single blooms, Mr. Charles Turner again occupied the leading position with excellent examples of most of his finest varieties mentioned in the former class, with the addition of Madame Lacharme, Alfred Colomb, Jean Ducher, Boieldieu, Innocente Pirola, Madame Margottin, Edouard Dufour, Comtesse de Nadaillac, and Countess of Bedford. The second prize was taken by Messrs. Curtis, Sanford & Co., and the third by Messrs. George Cooling & Son, Bath, both exhibits containing some very fine blooms. In this class Mr. J. Mattock lost the premier position owing to there being duplicate blooms of Marie Baumann in his stand, which in every other respect was an exceedingly good one.

In Class 3, for thirty-six single blooms, Mr. Mattock was first with a stand of remarkably even flowers, while the second and third prizes were awarded to Messrs. Curtis, Sanford & Co. and Mr. J. Walker, Thame, in the order stated. In Class 4, for twenty-four single blooms, Mr. J. Walker was first, Messrs. Curtis, Sanford & Co. second, and Mr. Charles Turner third. The most noticeable blooms in this class were those of Reynolds Hole, Abel Carrière, Duke of Teck, Dupuy Jamain, Mons. E. Y. Teas, Marie Baumann, Mdle. Marie Rady, Sir Garnet Wolseley, François Michelin, Madame Lacharme, Duchesse de Morny, Madame Eugène Verdier, Lælia, La France, Maréchal Niel, and Madame Margottin.

In Class 5, for twelve blooms of one variety, dark H.P., Messrs. Curtis, Sanford & Co. were first with a stand of beautiful blooms of Ulrich Brunner, Mr. Charles Turner second with Marie Baumann, and Jno. Bywater Ward, Esq., M.D., Warneford Asylum, Oxford, third with the same variety. In Class 6, for twelve blooms of one variety, light H.P., as in the previous one the exhibits were numerous and attracted the admiration of the great concourse of visitors. Messrs. Curtis, Sanford, & Co., obtained the first prize with Merveille de Lyon, staged in excellent condition. Mr. J. Mattock was second, and S. P. Budd, Esq., Bath, third, both competing with Baroness Rothschild, each stand containing remarkably fine specimens.

In Class 7, for six varieties, nine blooms of each in three stages of growth, Mr. J. Mattock was the only exhibitor, and was awarded the first prize—a special one—given by P. Southby, Esq., Bampton. In Class 8, for twelve varieties of Tea or Noisette (given by the President of the Society, Wm. Wooten-Wooten, Esq.), Mr. J. Mattock was first with a very fine stand of blooms, notably those of Souvenir d'Elise Vardon, Comtesse de Nadaillac, Devoniensis, Jean Ducher, Souvenir de Madame Pernet, Madame Welch, Madame Margottin, and Souvenir de Paul Neyron. The second prize was awarded to Messrs. George Bunyard & Co., Maidstone; amongst their best blooms were those of Devoniensis, Comtesse de Nadaillac, Niphetos, Jean Ducher, Laurette, Louis Gigot, and Madame Hippolyte Jamain. Mr. Charles Turner third.

There were four classes open to all (except growers for sale), each of these being well contested. In Class 9, for thirty-six varieties, distinct, single blooms (given by Lieut.-Colonel and Mrs. Morrell), the first prize was won by T. W. Girdlestone, Esq., Sunningdale, who exhibited a beautiful stand of blooms, especially those of Duchesse de Vallombrosa, A. K. Williams, Comtesse de Nadaillac, Mdle. Marie Rady, Annie Laxton, Mons. E. Y. Teas, Souvenir d'un Ami, and Duke of Teck. The second prize was awarded to S. P. Budd, Esq., and the third to Miss Watson Taylor, Manor House, Headington. In Class 10, for twenty-four varieties, single blooms, given as in the former one, S. P. Budd, Esq., was first, Jno. Bywater-Ward, Esq., M.D., second, and T. Strange, Esq., Aldermaston, third. In Class 11, for twelve varieties, single blooms, the first prize given by the Lord Valentia was gained by Mr. C. Colcutt, Oxford, the second by Mr. W. Narroway, and the third by Mr. A. Stow, Headington. In Class 12, for twelve varieties of Tea or Noisette, the first prize, given by the Treasurer of the Society (John Thomson, Esq.), was awarded to T. W. Girdlestone, Esq., who staged very fine flowers, amongst them were noteworthy specimens of Antoine Mermet, Comtesse de Nadaillac, Innocente Pirola, Madame de Watteville, Madame Lambard, Madame Eugène Verdier, Miss Edith Gifford, Maréchal Niel, Niphetos, Rubens, Souvenir d'Elise Vardon, and Souvenir d'un Ami. The second and third prizes being taken by Miss Watson Taylor and Mr. A. Evans, Marston.

The classes open to amateur members of the Society only were as keenly contested as some of the others, and the exhibits were highly meritorious. In the principal one, Class 13, for twenty-four distinct varieties, single blooms, Mr. A. Evans succeeded in obtaining the premier position, his best blooms being those of Mdle. Marie Coituet, Madame Marie Finger, Thomas Mills, Baroness Rothschild, John Hopper, Madame Victor Verdier, and Mons. E. Y. Teas. Mr. C. Taylor was second, and the Rev. E. Penwarne-Wellings, Stanford Vicarage, Faringdon, third.

At this point the ingress of visitors was so inconveniently numerous as to render it impossible to take note of anything further than the appendix list of prizewinners. Eighteen varieties, single blooms.—First, Mr. A. Evans; second, Mr. Wm. Narroway; third, Mr. C. Taylor. Twelve varieties, single blooms.—First, Mr. E. Thorne, Oxford; second, R. Ramsden, Esq., Chadwick Manor, Knowle, Warwick; third, Rev. H. A. Pickard, Oxford; fourth, Mr. J. Allin, Sandford-on-Thames. Nine varieties, single blooms.—First, Mr. F. Freeman; second, Mr. C. Colcutt; third, Rev. H. A. Pickard; fourth, Mr. H. Poulter, Oxford. For twelve varieties, three blooms of each.—First, Rev. C. Eddy, Bramley Vicarage, Basingstoke; second, Mr. A. Evans; third, Rev. E. Penwarne-Wellings. For six varieties, three blooms of each.—First, Mr. F. Freeman; second, Mr. C. Colcutt; third, Mr. E. Thorne;

fourth, R. Ramsden, Esq. For six blooms of one variety, H.P.—First, Mr. E. Thorne; second, Mr. C. Colcutt; third, Mr. Wm. Narrowway; fourth, Rev. E. Penwarne-Wellings. For six distinct varieties, Tea or Noisette.—First, Mr. F. Freeman; second, R. Ramsden, Esq.; third, Mr. C. Colcutt. For one bloom, H.P.—First, Mr. Wm. Narrowway; second, Mr. C. Colcutt; third, Rev. G. R. Downes, Begbroke, Oxford. For one bloom, Tea or Noisette.—First, Mr. C. Colcutt; second, Mr. F. Freeman; third, Rev. G. R. Downes.—J. B. E.

[The publication of this report was delayed by our correspondent inadvertently omitting to address it to the "Editor." See notice on page 73.]

BIRMINGHAM ROSE SHOW.—JULY 15TH AND 16TH.

THE first Exhibition of Roses in connection with the Botanical and Horticultural Society was a success, very fine blooms being staged, the competition close, and the entries good. The display was admirably staged in the new Glass Hall, and Mr. Latham created an excellent effect by a judicious arrangement of Ferns, Palms, and other plants. In class 1, for thirty-six trusses, the Cranston Nursery Company was first with a capital collection, the finest blooms being Deborah, Marquise de Castellane, a grand Duchesse de Morny, A. K. Williams, very fine; Merveille de Lyon, and Mons. E. Y. Teas. The second prize fell to Messrs. Perkins & Son, nurserymen, Coventry, in whose lot were fine blooms of Duc de Rohan, Violette Bouyer, Mrs. Laxton, Charles Darwin, and a lovely bright-coloured Tea, Souvenir de Thérèse Levet, which was very much admired. Third, Messrs. Paul & Son, Cheshunt Nurseries, who had fine blooms of A. K. Williams, Marshal P. Wilder, Madame Alphonse Lavallée, Queen of Queens, Lady Sheffield, and Duke of Teck. An equal third prize was also awarded to Mr. Charles Turner, Slough, the stand containing fine blooms of Marguerite D'Ombraïn, Merveille de Lyon, Comtesse de Nadaillac, A. K. Williams, and Ulrich Brunner.

For thirty-six blooms there were six entries. Messrs. Paul & Son were first, including splendid blooms of Madame Alphonse Lavallée, Star of Waltham, Countess of Rosebery, E. Y. Teas, Marshal P. Wilder, and A. K. Williams; second prize to the Cranston Nursery Company, Hereford, their finest blooms being Comtesse de Morny, Madame Caroline Kuster, Comtesse de Nadaillac, Prince Arthur, and Madame Willermoz. Third, Mr. Charles Turner, and a fine bloom of King of Bedders was especially noticeable in this stand, also good blooms of Caroline Kuster, François Louvat, and Marie Verdier.

With twenty-four single trusses Messrs. Cranston & Co. were first, and in their stand A. K. Williams, Antoine Ducher, Merveille de Lyon, Duchesse de Morny, Lady Sheffield, Horace Vernet, Lady Mary Fitzwilliam, and Reynolds Hole were all of very fine quality. Messrs. Perkins & Son, Coventry, were a good second, Louis Van Houtte, Mons. E. Y. Teas, Alba Rosea, Etienne Levet, and Merveille de Lyon particularly good.

For twenty-four single blooms the Cranston Company were to the front with Madame Ferdinand Jamain very fine; Lady Sheffield, Duke of Edinburgh, and Horace Vernet and other kinds. Second, Messrs. Paul & Son, Cheshunt, Merveille de Lyon, Souvenir d'Elise Vardon, and Marie Baumann very fine. Third, Mr. H. Frettingham, Nottingham.

In the class for twelve Teas and Noisettes, first, Messrs. Paul & Son, Cheshunt, with a beautiful lot, consisting of Alba Rosea, Madame Cusin, Maréchal Niel, Niphetos, Catherine Mermet, Souvenir d'Elise Vardon, Souvenir d'un Ami, Perle des Jardins, Innocente Pirola, La Boule d'Or, Caroline Kuster, and the Hon. R. Giffard. Second, the Cranston Nursery Company, with Marie Van Houtte, Madame Thérèse Levet, Innocente Pirola, Jean Ducher and others, a fine lot. Third, Mr. Charles Turner, including a grand bloom of Comtesse de Nadaillac and a very fine Madame Lambard.

In the amateur classes for twenty-four trusses, the Rev. H. W. Watson was first, having in his stand fine blooms of George Prince, E. Y. Teas, and Caroline Kuster. For twenty-four singles, A. H. Griffiths, a well-known local grower, was first, and fine blooms of François Michelin, Captain Christy, Marie Verdier, Duc de Rohan, A. K. Williams, and Etienne Levet were in this stand; W. G. Mayhew, Esq., was second, and Mr. Brown of Elmdon Hall, third. For twelve trusses, R. Ramsden, Esq., was first; A. H. Griffiths, Esq., second; Rev. W. J. Williams, third. For twelve blooms Mr. Griffiths was again first, including fine blooms of Marie Verdier, Charles Lefebvre, François Michelin, Rosieriste Jacobs, and Duchesse de Vallombrosa. Second, Rev. W. J. Williams. Third, J. Richards, Esq.

With twelve Teas and Noisettes the Rev. Mr. Williams was first with Marie Van Houtte, Etoile de Lyon, Jean Ducher, Souvenir de Paul Vernet, Anna Olivier, Perle des Jardins, Madame Hippolyte Jamain, Caroline Kuster, Catherine Mermet, Souvenir d'Elise Vardon, Madame Furtado, and a very fine Madame Lambard. Second, R. Ramsden, Esq. Third, Rev. Mr. Watson.

A few good Rose bouquets were shown, and altogether a very good display was made, and it is probable that an annual Rose show will now take place in the Botanic Gardens. Mr. F. Perkins, nurseryman, Leamington, contributed a basket of Pelargonium Volunté Nationale althum in fine condition, also capital Rose bouquets and sprays. Mr. Hans Niemand set up a beautiful group of plants not for competition, and obtained certificates for Caladium candidum and Abutilon Thompsoni flore-pleno. Mr. Vertegans contributed a collection of alpine and herbaceous plants, and Mr. Davidson, nurseryman, Hereford, a box of excellent blooms of Merveille de Lyon.

BEDFORD AND BEDS HORTICULTURAL SOCIETY.

THE second annual Exhibition of this Society, which, with the exception of open classes for Roses and cut herbaceous flowers, is limited to exhibitors residing within the county, was held at Bedford on Wednesday, the 15th inst. As regards the Show generally, the exhibits, which chiefly came from amateurs and cottagers, were of fair average merit, but there were no dealers' classes. The vegetable department was the best; fruits and plants, doubtless in consequence of the smallness of the prizes, being almost practically unrepresented by good show specimens in competition. Some good Grapes, however, came from Mr. Landers, gardener to S. Whitbread, Esq., M.P., Southill Park, and some fine Tomatoes from Mr. Allis, gardener to

Major Shuttleworth, Old Warden, and a creditable collection of fruit from Mr. R. Waller, gardener to Jas. Howard, Esq., M.P., took first prize in the gardeners' class for six kinds. The principal prizes for vegetables were well contested, Mr. Waller taking the lead with a fine tray of twelve sorts. He was also first with a collection of six varieties of Peas shown in good colour and size. Mr. G. Vyne, gardener to H. Thornton, Esq., Kempston Grange; Mr. Ellis, gardener to Mrs. Orr, Pemberley, Bedford; and Mr. G. Robinson, gardener to F. Howard, Esq., the Abbey Close, Bedford, were well to the front with fine collections in various classes in this department. Mr. Laxton of Bedford and Girtford, exhibited a series of his new Peas, several of which have been certificated by the Royal Horticultural Society; Evolution, Charmer, Victorious, Walton Hero, and Sensation being especially noticeable.

The open classes, however, for Roses and cut herbaceous flowers constituted the feature of the Show, all the classes being well contested, and it is to be regretted that the number of classes were not more numerous, as Bedford, from its central position and railway facilities, would doubtless command a good competition. Teas especially should not be omitted in the open classes. On this occasion there were no less than eight stands of forty-eight distinct Roses staged in the dealers' classes, open to all England, for the prizes of £10, £5, and £3, the consequence being that several excellent stands had to go away entirely unremunerated, and amongst these the Judges had no little difficulty in discriminating, so generally good were the flowers. Another season the Committee would do well to add open classes for twenty-four blooms singles or trebles, and for eighteen Teas.

For the open forty-eight Mr. B. R. Cant of Colchester was first with grand blooms, being quite up to his champion form. His finest flowers were Merveille de Lyon (now acknowledged to be the best of the white sports from Baroness Rothschild), Lady Sheffield (well shown also in several stands), Duke of Edinburgh, Reynolds Hole, Sultan of Zanzibar, Queen of Queens, Dr. Sewell, Mdle. Prosper Laugier, Mdle. Eugénie Verdier, Mrs. Jowitt, Black Prince, Star of Waltham, Marie Verdier, Emilie Hausberg, Madame Crapelet, and Madame Cusin. Mr. F. Cant was second with smaller but fresh flowers, including Duke of Teck, A. K. Williams, Annie Laxton, Lady Sheffield, and Camille Bernardin. Messrs. J. Burrell & Co., Cambridge, came very close for third with well-coloured blooms, the most noticeable being La Boule d'Or (very fine), Marquise de Castellane, John Hopper, A. K. Williams, Star of Waltham, Pride of Waltham, Dr. Andry, Madame P. Laugier, Duke of Edinburgh, Madame V. Verdier, and Madame Montet. Messrs. Paul & Son (who were also showing concurrently at Birmingham); Mr. J. House, Peterborough; Mr. George Prince, Oxford; Mr. W. Rumsey, Waltham Cross; and Mr. James Sheppard, Bedford, also staged well in this class. Mr. House also showed a beautiful box of William Allen Richardson, and Mr. Laxton a box of his pretty and floriferous new Rose Bedford Belle, as well as some good boxes of various Roses not for competition.

In the class for twenty-four distinct trusses, open to amateurs of all England, the competition was strong and spirited, the Rev. J. H. Pemberton of Havering-atte-Bower, Essex, taking the cup with, amongst others, a splendid Niphetos and fine flowers of Louis Van Houtte, Ulrich Brunner, H. Vernet, Magna Charta, Baroness Rothschild, Madame Lambard, Beauty of Waltham, and Madame H. Jamain. Mr. S. P. Budd of Bath was second, having Princess of Wales, Lady Sheffield, Countess of Oxford, and Comte de Raimbaud; Mr. Alfred Slaughter, Steyning, coming third, and the Rev. E. L. Fellowes, Wimpole Rectory, Royston, receiving commendation for an approximately fine stand. For twelve distinct trusses, open to amateurs of all England, the Rev. J. H. Pemberton was again first; Mr. E. B. Lindsell of Bearton, Hitchin, second; and Mr. Budd third. For twenty-four blooms (eighteen varieties) in the local amateurs' class, the Rev. W. H. Jackson, Stagsden Vicarage, Bedford, was first, Mr. Vyne second, and Mr. Ellis third. For twelve ditto Mr. Jackson was again first, as also for twelve Teas; and for nine blooms in the class for amateurs not employing a gardener Miss Thomas, The Cottage, Bletsoe, and for six ditto Mr. G. Fisher, Warden, were respectively first.

Hardy herbaceous and bulbous flowers were well shown in the open class, Messrs. Burrell & Co. of Cambridge, who seem to be making these a specialty, having a very attractive display, to which first honours were awarded. Mr. Laxton here also had well-selected and showy blooms for second, Messrs. Horton and Sheppard of Bedford being respectively third and fourth with good displays. With more open classes a good general show would soon be established in Bedford.

WIRRAL ROSE SHOW.

THIS Society, which in its liberality and desire to encourage Rose-growers is exceeded by none and equalled by few, has never been very fortunate in the weather when its shows have been held, and this year it has been specially; not that the day was as bad as some have been on which the shows have been held, but because up to this time every Rose Society that I have attended and whose doings I have heard of, have been favoured with fine weather, and it seemed especially trying to find that the rain so much longed for and desired by everybody, should have come on a day on which fine weather was so much desired. The Exhibition was held, too, this year in the open, under a very handsome tent erected on the grounds of Hamilton Square, Birkenhead. At its first beginning it was held in the Park at Birkenhead, but that proved unsuccessful in a financial point of view, and so it was determined to remove it to Liverpool, and for two years it was held in St. George's Hall, a splendid room no doubt, but where the light was wretchedly bad. The Liverpool people held aloof from it, and each year it proved a failure as far as the sinews of war were concerned, and so it was determined again to hold it at the Cheshire side, and to have it under a tent. The grounds of Hamilton Square had never before been used for any such purpose, and it was therefore the more to be regretted that the weather was not favourable; however, it cleared off somewhat in the afternoon, and a considerable number of visitors attended.

The Exhibition itself was an excellent one, and the local exhibitors especially are to be congratulated on the manner in which they have improved in the culture and setting up of the Roses. The amateur portion of the Exhibition was decidedly superior to the professional, and with the full

recollection of the box of thirty-six which Mr. Jowitt once exhibited here, I question very much if a better box of thirty-six was ever set up here better than that of Mr. T. B. Hall; in fact, his Roses all through were superb, and were evidently so recognised by the Judges, as he swept off the honours in every class in which he exhibited. He was close at home, and when one saw the splendid condition of his plants any wonder ceased that he should have been enabled to exhibit in such good form. There were, for the first time this year that I can remember, some blooms which stood out prominently above all others as Roses to be remembered. There was a Marie Van Houtte in Mr. Garnett's, an Abel Carrière in Mr. Grant's, a Souvenir de Thérèse Levet in Mr. House's, and a Madame Lambard in Mr. Claxton's stand, which I have no hesitation in saying were the very finest examples of those Roses I have seen this year. It was only the evening before that a thoroughly good rosarian said to me that Abel Carrière was not an exhibition Rose. I was pleased to bring him to book and to show him that if this class had been permitted to enter into competition for the best H.P. in the Show it would have carried it off. Teas are largely patronised in Wirral, and many amateurs grow them exceedingly well; so much so, that one of its members, Mr. Claxton, carried the banner of Wirral to Canterbury on June 28th, and carried it out triumphantly, beating Messrs. Cant, Paul, and Prince. It might have been expected, then, that here Teas would be in great force, and so they were. There were several classes for them, and the stands exhibited by Mr. T. B. Hall and others, but especially the Larchwood Teas, were remarkably fine.

There was not a large competition for the basket of Teas, Noisettes, and Hybrid Teas for the National Rose Society's medal, but three excellent baskets were set up by Mrs. Garnet, Miss Hall, and Mrs. Claxton, who took the prizes in the order named. Each had their peculiar style. Mrs. Garnet's was very beautiful, and that of Miss Hall showed an artistic character which, had a few gaps been filled up, would have run it very close.

In the class for seventy-two, distinct, Mr. F. Cant of Colchester was first with the following flowers—Heinrich Schultheis, Earl of Pembroke, La France, Dr. Sewell, Reynolds Hole, Comtesse de Paris, Duchess de Vallombrosa, Fisher Holmes, Baron Gonella, Jean Souper, Lady Sheffield, Beauty of Waltham, Madame Angèle Jacquier (Tea), Antoine Ducher, Comtesse de Nadaillac (Tea), Alexandre Dupont, John S. Mill, Catherine Mermet (Tea), Sultan of Zanzibar, Marquise de Castellane, Harrison Weir, Adam, Duc de Wellington, Souvenir d'Elise (Tea), Pitord, Paul Neyron, Admiral Seymour, Mrs. Charles Wood, Madame Bernardin, Dupuy Jamain, Lady Mary Fitzwilliam, Madame Marie Rady, Merveille de Lyon, Marie Louise Pernet, Duke of Edinburgh, Dr. Andre, Louis Van Houtte, Comtesse d'Oxford, Alfred Colomb, Madame Gabriel Luizet, Prince Camille de Rohan, Madame Charles Crapelet, Abel Carrière, Pride of Waltham, Marie Baumann, Madame Hippolyte Jamain, Madame Victor Verdier, Captain Christy, Ulrich Brunner, Marie Finger, Charles Darwin, Madame Marie Cointet, John Bright, Marie Van Houtte, Madame George Paul, Star of Waltham, Alfred K. Williams, Marie Vardier, Baron de Bonstettin, Baroness Rothschild, Mrs. Jowitt, Maréchal Niel, Pierre Notting, Etienne Levet, Horace Vernet, Duchesse de Morny, Duchess of Bedford, Comtesse de Chabillant, Duke of Connaught, Queen of Queens, and Annie Wood. Messrs. Paul & Son were second, and the Cranston Company third. In the class of thirty-six, three blooms of each, Messrs. Paul & Son were first with Charles Darwin, Madame Eugène Verdier, Sénateur Vaisse, Devoniensis, Abel Carrière, Devoniensis, Maréchal Niel, A. K. Williams, Pride of Waltham, Captain Christy, Edouard Andre, Berard Corate, Comtesse de Nadaillac (Tea), Duke of Teck, Innocente Pirola, Marie Baumann, Comtesse d'Oxford, Graudeur of Cheshunt, François Michelin, Dr. Andry, Catherine Mermet (Tea), Niphotos (Tea), Reynolds Hole, Countess of Rosebery, Marshal P. Wilder, La France, Mons. E. Y. Teas, Star of Waltham, Souvenir d'Elise (Tea), Lady Sheffield, Merveille de Lyon, Paul Neyron, Charles Lefebvre, Camille Bernardin, Ulrich Brunner. The Cranston Co. were second, and Mr. F. Cant third. In Class 3, for thirty-six varieties, Mr. George Prince was first with Comtesse d'Oxford, Duke of Connaught, Reynolds Hole, Graudeur of Cheshunt, Prince Arthur, Alba Rosea, Madame Sophie Fropot, Louis Van Houtte, Lady Sheffield, Annie Wood, Maréchal Niel, Duchess of Bedford, Souvenir de Paul Neyron, Madame Victor Verdier, Ulrich Brunner, Sultan of Zanzibar, Pride of Waltham, Xavier Olibo, Marie Finger, Sénateur Vaisse, Baroness Rothschild, Eclair, Niphotos, Marie Baumann, Duke of Teck, Charles Darwin, Perle des Jardins, Prince Camille de Rohan, Hon. Edith Giffard, Harrison Weir, Alfred Colomb, Comtesse de Nadaillac, A. K. Williams, Star of Waltham, Merveille de Lyon, and Horace Vernet. Messrs. F. & A. Dickson, Chester, were second, and Mr. J. House, Peterborough, third. In Class 4, eighteen varieties, three blooms of each, Mr. George Prince was first with Madame Lambard (Tea), Comtesse de Nadaillac, Louis Van Houtte, Innocente Pirola, Prince Camille de Rohan, Comtesse d'Oxford, Prince Arthur, Hon. Edith Giffard, Marie Baumann, Maréchal Niel, Horace Vernet, Alfred Colomb, Etoile de Lyon, Duke of Edinburgh, Reynolds Hole, Niphotos, Xavier Olibo, Merveille de Lyon, and A. K. Williams. Messrs. James Dickson & Son were second, and Mr. House third. In Class 5, for eighteen Teas or Noisettes, Mr. J. House, Peterborough, was first with Madame Lambard, Jean Ducher, Comtesse de Nadaillac, Niphotos, Marie Van Houtte, Comte de Paris, Laurette, Innocente Pirola, Souvenir de Thérèse Levet, a magnificent bloom; Etoile de Lyon, Catherine Mermet, Souvenir d'Elise, Perle des Jardins, Belle Lyonnaise, Devoniensis, Marie Guillot, Maréchal Niel, and Alba Rosea. In class 6, for twelve varieties of new Roses, Messrs. Paul & Son were first with Benoit Comte, Madame Norman-Neruda, Ellen Gordon, Lord F. Cavendish, Heinrich Schultheis, Duke of Albany, Pride of Reigate, Queen of Queens, Mons. Francisque Rene (?), and Maréchal P. Wilder; and the Cranston Co. were second.

We now turn to the amateurs, where unquestionably the best blooms in the Show were to be seen. In Class 36 Mr. T. B. Hall was easily first with a stand in which there was not one indifferent flower. They were all fresh, bright, and clean, and consisted of Marie Finger, Louis Van Houtte, François Michelin, Marie Rady, Mrs. Jowitt, Merveille de Lyon, Etienne Levet, La France, Charles Lefebvre, Capitaine Christy, Duke of Teck, Marie Baumann, Duke of Edinburgh, Violette Bouyer, Sir Garnet Wolseley, Jules Finger, Lady Mary Fitzwilliam, Comtesse de Paris, Souvenir d'Elise, Marie Verdier, Xavier Olibo, Marquise de Castellane, A. K. Williams, Camille de Rohan, Dr. Andry, Madame Sophie Fropot, Charles

Darwin, Beauty of Waltham, Prince Arthur, Alfred Colomb, Baroness Rothschild, Général Jacqueminot, Madame Lacharme, Le Havre, and Duchesse de Vallombrosa. The Rev. J. H. Pemberton was a good second; Mr. W. J. Grant, Ledbury, third; and Dr. Budd, Bath, fourth. In the class for twenty-four the Rev. Lionel Garnet, Christleton Rectory, near Chester, was first with Duchesse de Morny, François Michelin, Merveille de Lyon, Madame Nachury, Madame E. Verdier, Marie Finger, Ulrich Brunner, J. S. Mill, Duke of Edinburgh, François Louvat, Le Havre, Marquise de Castellane, Baroness Rothschild, Etienne Levet, Mabel Morris, Dupuy Jamain, Capitaine Christy, Marie Verdier, Duchess of Vallombrosa, Annie Wood, La France, Marie Van Houtte (a magnificent bloom), A. K. Williams, and Heinrich Schultheis. Mr. A. Tate, Wootton, was second; Mr. J. E. Backhouse, Darlington, third; Mr. G. Berrington, Ludlow, fourth. In Class 9 for twelve varieties, Mr. T. B. Hall was again first with fine blooms of Madame Hippolyte Jamain, Dr. Andry, Marie Finger, Marie Baumann, Marquise de Castellane, Louis Van Houtte, Etienne Levet, La France, Sir Garnet Wolseley, Alfred Colomb, Capitaine Christy, and François Michelin. The Rev. J. H. Pemberton was second, and Dr. Budd third. In Class 11 Mr. T. B. Hall was again first with twelve blooms of Marie Baumann, twelve of any dark Rose, and again in Class 12 for twelve blooms of any light Rose with Capitaine Christy. In Class 13 for six blooms of new Roses he was also first with Merveille de Lyon, Princess of Wales, Thérèse Levet, Queen of Queens, Hon. Edith Giffard, and Lady Mary Fitzwilliam. In Class 14, best box of twelve (six Teas and six Hybrid Perpetuals) he was also first with Horace Vernet, Etoile de Lyon, A. K. Williams, Innocente Pirola, Caroline Kuster, La Havre, Marie Van Houtte, Charles Lefebvre, Jean Ducher, Madame Charles Crapelet, and Madame Margottin. In Class 15, six blooms of Teas or Noisettes, Mr. T. B. Hall was also first with Marie Van Houtte, Jean Ducher, Souvenir d'Elise, Mons. Furtado, Francisca Kruger, and Etoile de Lyon. In Class 16, best basket of Teas, Noisettes, and Hybrid Teas Mr. Lionel Garnet of Christleton Rectory was first with a beautifully fresh basket, carefully arranged, and Miss Hall of Larkwood, Rockferry, second, and Mrs. Claxton third.

In Class 17, for amateurs in Lancashire and Cheshire, Mr. T. B. Hall was again to the front with a beautiful box of twenty-four, including La France, A. K. Williams, Captain Christy, Le Havre, Madame Sophie Fropot, Louis Van Houtte, Merveille de Lyon, Duke of Edinburgh, Camille Bernardin, Thérèse Levet, Comtesse de Camanto, Jules Finger, Sir Garnet Wolseley, François Michelin, Rosieriste Jacobs (very good), Marie Finger, Lord Macaulay (a very fine bloom), Dr. Andry, Marie Verdier, Beauty of Waltham, Lady Mary Fitzwilliam, Marie Baumann, Madame Charles Crapelet, and Charles Lefebvre. The Rev. Lionel Garnet was second, Mr. J. H. Angus third, and Mr. Tate fourth. In Class 18 for eighteen varieties Mr. J. H. Angus was first with Etienne Levet, Duke of Wellington, Captain Christy, Dupuy Jamain, Baroness Rothschild, Charles Lefebvre, Mrs. Charles Wood, Mlle. Eugénie Verdier, Marie Baumann, La France, Mrs. Baker, Victor Verdier, Fisher Holmes, François Michelin, Louis Van Houtte, Duchesse de Caylus, Madame Gabriel Luizet, and Auguste Rigotard. Mr. W. E. Hall was second, Mr. W. Newmann, Allerton, third, and J. C. Churton fourth. In Class 19, for twelve single blooms, Mr. T. Hargreaves was first with Captain Christy, J. S. Mill, Madame Gabriel Luizet, Charles Lefebvre, Duchesse de Morny, Marie Baumann, Dr. Andry, General Jacqueminot, Louis Van Houtte, François Michelin, Etienne Levet, and Baroness Rothschild. Mr. Watson was second, Mr. Charles Hill third, and Mr. W. Draper fourth. In Class 20, for six single blooms, Mr. Joseph Armstrong, Lower Bebbington, was first with Merveille de Lyon, Fisher Holmes, Duke of Teck, Captain Christy, Baroness Rothschild, and Marie Baumann. Mr. Bulley was second and Dr. Bell, New Brighton, third. In Class 21, for twelve Teas or Noisettes, Mr. Claxton was first with Innocente Pirola, Jules Finger, Niphotos, Adam, Christophe, Madame Angele Jacquier, Madame Willermoz, Souvenir de Thérèse Levet, Caroline Kuster, Madame Cusin, Madame Lambard, Comtesse de Nadaillac, and Francisca Kruger. Mr. T. B. Hall was second. In class 22, for six blooms, Teas or Noisettes, Mr. W. E. Hall was first with Jean Ducher, Devoniensis, Caroline Kuster, Souvenir d'un Ami, Perle des Jardins, and Marie Van Houtte. In class 23, for three blooms of Teas, Mr. Walton was first with Madame Thérèse Levet, Madame Lambard, and Gloire de Dijon. In class 24, for twelve blooms, six Hybrid Perpetuals and six Teas, arranged with Maidenhair Fern, Mr. T. B. Hall was first with Madame Margottin, Le Havre, Niphotos, Prince Camille de Rohan, Francisca Kruger, Prince Arthur, Madame Willermoz, Général Jacqueminot, Etoile de Lyon, Fisher Holmes, Marie Van Houtte, and Charles Darwin. The prize for the best Hybrid Perpetual bloom was awarded to Mr. T. B. Hall for a grand bloom of A. K. Williams, and for the best Tea for a splendid flower of Madame Lambard to Mr. E. Claxton.

There are a few things to be noticed ere I conclude this report. One is the very great improvement that has taken place in the local exhibits. There were none of them that could be even called indifferent, and the setting up was vastly better than in former years. Another is the manner in which Mr. T. B. Hall swept the board. Those who have seen his garden will not wonder at this. I have seen most Rose gardens, both those of amateurs and nurserymen, and I never saw such plants. It is not the number that he grows, for many of those who competed with him grow twice and three times the number, but it is entirely attributable to the splendid condition of his plants and his unceasing and intelligent care of them. I may have somewhat to say of these plants by-and-by, and then one sees how much attention is given to Teas. They are deservedly great favourites in Wirral, and each year sees the number of exhibitors winning. The Show was altogether a success, and not the least pleasing feature was that £22 was obtained for the Children's Hospital by the sale of Roses kindly sent in for the purpose.—D., Deal.

THE EXPORT TRADE IN APPLES.—The following facts and figures in regard to the export trade in Apples from this country are given by the *Irish Farmers' Gazette* from the annual Apple circular of Lombards, Sons:—The total exports for the season of 1884-85 from the United States and Canada have been 787,785 barrels. For the season of 1883-84 the total exports were 81,532 barrels; 1882-83, 395,594 barrels; 1881-82, 239,252 barrels; 1880-81, 1,328,806 barrels. The shipments have been

Late Peas.—These are very valuable, especially in October, and where the young crops show any indication of suffering from drought water them thoroughly, and mulch along the edges of the rows with old half-decayed material from the lawns if no better manure can be obtained. Where any of those coming into pod or bloom are dry at the root and the foliage is rather yellow in colour, treat them in the same way as the late ones. Liquid manure is best for them, and when we cannot get this from the cattle sheds or dung heap we dissolve a small handful of guano in each of our 4-gallon watering pots and drench them with this. Gather Pea seed which is ripe before the birds have the chance of opening the pods. Clear

away all old haulm, and use the stakes which have been at the early ones to support the late crops.

Celery.—This will now take large quantities of water. Over-dryness at the roots is sure to cause it to run to flower. Planting out the crops should be completed as soon as possible. White Plume and the Turnip-rooted variety should not be put in trenches, but on the level. The earliest crops, which are now a good size, should be earthed up. Do not allow a particle of soil to fall into the centres of the plants. Clear off a few of the short outside leaves, and tie the plants up with a piece of matting until earthing up has been finished. Before earthing, the plants should be thoroughly watered, and then they will require little or no more, as the bulk of soil used in earthing will keep the roots cool.

Winter Parsley.—This is important there should be no deficiency of it. Make a good sowing now in a position where part of the plants can remain, and the thinnings may be planted elsewhere. Parsley is not so liable to be attacked by the grub in autumn as during the summer, and in places where it cannot be grown with any great success in summer it may frequently be had in large quantities and in prime condition by sowing now.

Leeks.—Where these are still in the seed rows or bed get them out as soon as possible. They are not particular as to position, but they must have rich soil.

Autumn Onions.—These have gained a large size, and as some of them are beginning to split, the whole will be drawn up and laid out to dry in the sun. The split ones will be used at once, and the whole will be sent to the kitchen before the spring-sown ones are used. Water all crops which are suffering much through drought. Keep the hoes going, and give no quarter to weeds, especially those likely to seed. Clean flower pots and smart glass houses are very desirable at this season, but kitchen gardens overrun with weeds are not creditable, and a handy man with his hoe on a sunny day would destroy the weed crop on some acres of land.

FRUIT FORCING.

VINES.—*Early-forced Vines*.—Where early-forced thin-skinned Grapes are preferred to thick-skinned varieties that have been kept in the Grape-room, the wood of the Vines will now be getting brown and hard, if, indeed, it is not quite ripe. The foliage being clean and healthy, a dry warm atmosphere with abundance of air by night will insure the perfecting of the buds, as upon this depends the production of compact closely set bunches, which colour and finish better than those from badly ripened wood. The laterals should be kept well in hand if the Vines are in good health, but if weak they may be allowed to extend. An occasional syringing will be all that is necessary to keep the foliage free from insect pests.

Renovating Early Vines.—Work of this kind should be taken in hand without delay. If the roots have the run of outside and inside borders, one of them may be taken out and fresh compost supplied without running any risk as to the loss of the next year's crop. It is important that the work be quickly and carefully performed, and the house kept close, warm, and shaded until new growth commences.

Early Vines in Pots.—Those intended for early forcing may be removed to a south wall for a time, securing the canes to the wall as a protection against wind; but if they occupy a house with moveable roof-lights, the latter may be drawn down to an extent that will favour the healthy maturation of the wood and due ripening of the foliage, without producing a shock so fatal to the fruiting of otherwise well-grown Vines in pots.

Young Planted-out Vines.—Vines planted this spring should be encouraged with heat and moisture until they have filled the space allotted to them. A free lateral growth suits them best, as the object the first year is the formation of roots and a few well-ripened buds near the base for pruning back to, these being essential for affording sturdy short-jointed growths in the coming season. If supernumeraries are planted for affording fruit next year, they should have the laterals closely pinched, especially those from the joints, which are to afford fruit from the eyes there situated next season, it being important that the foliage have free exposure to light and air for the thorough maturation of the buds, but the laterals above next year's pruning wood may be allowed extension, as it will facilitate root-action and be of benefit to the crop another season.

Grapes under Sudden Changes of Weather.—Sudden changes from dull wet weather to bright sunshine are very trying to Vines in all stages of growth, particularly to Lady Downe's, Muscats, Alicantes, and other late varieties that are liable to be scalded, and are equally unfavourable to the preservation of ripe Grapes, which soon lose colour when fully exposed. Where it is necessary to keep black Grapes for a long time after they are ripe, a little shade over the roof-lights on bright days will be of great service provided the wood and foliage are not deprived of the benefit of light when the sun is off the roof. Where this cannot be done some pilchard nets or a double thickness of herring nets thrown over the lights loosely will answer the purpose, as they do not exclude too much light, and may remain on until the Grapes are cut. The only safeguard against scalding is a warm atmosphere at night, with free ventilation by day, especially in the early part.

Vines Swelling their Crops.—Every attention must be given to Grapes swelling, especially where the crop is heavy, seeing that the inside borders have sufficient tepid liquid manure, not less in temperature than the mean of the house. If the weather be dry outside borders will require similar attention, but if the rainfall be good all that is necessary is mulching with old manure. If the Grapes are well advanced, and the ripening is not wished to be accelerated, admit abundance of air through the early part of the day, closing with sufficient sun heat to raise the temperature of the house to 90° in the afternoon, and give a little night air. Keep

the house well supplied with ammonia by the introduction of fresh horse droppings, not in great quantities, but little and often, and ply the syringe on all available surfaces at closing time; but avoid its careless use, as it is a great blemish to spot the Grapes. Red spider must, under any circumstances, be kept in check, and if it appears there is no better remedy than the tedious one of sponging. Sulphuring the pipes whilst hot, though a certain remedy, must be done with judgment, as the skin of some Grapes is readily injured by its fumes.

FIGS.—*Early-forced Trees*.—Trees that have been several months in bearing will need great perseverance in the application of water through the syringe to the foliage in order to keep down insect pests, and even then red spider and scale will gain a hold, particularly where the roots have not been liberally supplied with stimulating food. When this is the case, and succession houses are giving a supply, no time should be lost in throwing open the ventilators by day and night, exposing the foliage to refreshing showers by drawing off the lights on all favourable occasions. Warm thunder rain is, perhaps, more cleansing than any other—at least, good rains benefit both the roots and foliage by passing through every part of the plunging material, which is matted with thick fleshy roots.

Succession Houses.—The second crop will be considerably advanced, and will require liberal thinning. Syringe twice a day. The mulching must be kept constantly moist for the present, maintaining a brisk growing temperature from solar heat after closing until the fruit shows signs of ripening, when a drier atmosphere by night must be afforded; but there must not be any great reduction of the moisture by day. Attend steadily to the stopping and tying, avoiding overcrowding the young shoots, as these, to give fine Figs, must be vigorous and allowed to grow up to the glass, so as to have all the warmth and light possible.

Young Trees in Pots.—Those raised from cuttings or eyes must be potted without delay, so as to secure a well-matured growth. Young early-started pot trees intended for forcing for the first time should have the growths ripened before they are taken outdoors for a season of rest, and when taken out a warm dry corner should be selected for plunging them in. If the roots have passed into the plunging material they should be cut through by degrees.

PLANT HOUSES.

Rhodanthes.—These are amongst the most useful annuals in pots, and should be extensively grown for purposes of decoration. They are not only useful early in the season, but through the whole summer, and specially so during the autumn months. Sow seed at once for plants to commence flowering about the middle of October, and these will continue until *Corysanthemums* are plentiful. Pots 5 inches in diameter are the most serviceable size in which to sow the seed. After nearly filling them with a compost of good loam, one-seventh of manure and sand, a little leaf mould may with advantage be added. Cover the seed lightly with soil, well water them, and then stand them in a frame until germination has taken place. The frame in which they are placed should be shaded to prevent farther watering until the young plants appear. After the seedlings are well up and ready for thinning, they will do as well plunged outside as grown in the frame if attention is paid to the watering, never allowing them to get dry.

Campanulas.—The varieties of *C. calycanthema* are most useful in pots, both for cutting and conservatory decoration, from the early part of April until they flower naturally in outside borders. The seed germinates so freely when sown on the surface of soil outside during showery weather in spring, that it is not necessary to sow the seed in pots and pans under glass. From seed sown early in the season good plants may now be lifted and placed into 6 or 8-inch pots according to their size, the latter being the most suitable. After lifting syringe freely and keep the plants well watered, and their growth will develop rapidly, and before the end of the season very strong plants will be the result. These should be housed in autumn in a cold vinery or Peach house after the approach of frost, or a cold frame. The earliest batch to flower may be brought forward in a little heat early in January. The conditions of an early vinery or Peach house just started will suit them very well for a time, but after they commence growing a close atmosphere must be avoided. The later batch may be brought forward under cooler treatment. When large plants in 10-inch pots 3 feet or more in diameter are wanted, seed should be sown about the end of August in a box, and when large enough pricked out into other boxes, wintered in a cold frame, and then grown on the whole of the following season. Those who have not cultivated these plants in pots for early flowering will find that few plants repay better for the little care and trouble required.

Mignonette.—A good number of pots should be filled with similar soil to that recommended for *Rhodanthes*, and then sown with the seed of *Mignonette* for autumn and early winter flowering. The same size pots are very suitable, and the same treatment may be given the plants until the approach of cold nights, when they should be placed in a cold frame. A bed may be sown outside at once with the common garden variety, after enriching the soil with a little manure and pressing it moderately firm. When the plants are up they should be liberally thinned, and they will grow strongly instead of being weak and puny, which is the case when crowded. This bed should be covered with a frame before the approach of frost, and the result will be abundance of material for cutting after that growing outside has been destroyed by frost, and while those grown in pots are doing duty in the conservatory or any structure kept gay. Tree varieties to be grown into standards, if sown and treated as previously directed, should be placed into 9-inch pots and secured to the trellis upon which they are to be trained. It is a mistake to allow the young plants to become root-bound in their 5 and

6-inch pots before giving them their final shift. If once they become root-bound in small pots they become woody and fail afterwards to do satisfactorily.

THE FLOWER GARDEN AND PLEASURE GROUND.

Mulching Flower Beds.—Owing to the long spell of very hot and very dry weather a considerable amount of watering will have been done, and in many cases very probably much more water will have been given than is good for the plants. A nightly watering, perhaps with very cold hard water, generally has the effect of impoverishing and making the borders cold and unkindly, the plants not making good progress under such treatment. Our plan of preserving sufficient moisture at the roots without frequent waterings is to give the beds a good soaking of water over-night, followed in the morning with a surface hoeing and a mulching of some kind. Leaf soil and cocoa-nut fibre are the best materials for mulching, and these not being available fine dry soil will be found an excellent substitute. The latter effectually checks rapid evaporation, and is not so liable to be scratched about by the birds. The Zonal Pelargoniums do best during a hot dry season, and after a heavy rain or watering followed by mulching will require little or no further assistance in the way of watering. Verbenas, Violas, Calceolarias, Lobelias, Begonias, Plox Drummondii, and other moisture-loving plants will be benefited by occasional watering, varied during showery weather with weak liquid manure. Pyrethrums, Petunias, Marguerites, Ageratums, Tropæolums, Perilla, and Marigolds stand the drought fairly well, and ours when once established receive no further waterings.

Pegging Down and Stopping.—In order to fill the beds evenly and neatly, both pegging down and stopping has in many cases to be resorted to. When in anticipation of this the plants are put in in a sloping direction, pegging down is a comparatively easy matter, but if they are planted uprightly then they are liable to snap off, this being especially the case with Pelargoniums and Calceolarias. Prior to pegging down the plants the beds should be stirred with the Dutch hoe, and firmed down with the rake if need be, and the mulching following watering applied, as this cannot be properly done later on. For the stronger-growing plants strong pegs are required or they will spring up again, and such pegs may be cut from the shrubberies. Fagot wood or the old prunings of Apple or Pear trees properly dried and stored may be used, these being merely shortened, bent nearly double over the shoot to be fastened down, and the two ends be firmly thrust into the soil. For Iresines, Petunias, Verbenas, Ageratums, and other plants of moderate growth, pegs may be cut from common bracken, old birch brooms, &c. The plants being evenly distributed over the soil, taking care to confine them to their proper lines, should have all straggling shoots stopped, and this will tend to make them more compact. Many of the single Dahlias, notably alba or White Queen, are very effective when pegged down, but it is useless to attempt it unless they were planted in a sloping direction.

Carpet Beds.—These now require weekly attention, or otherwise the requisite neatness of the panels and accuracy of the lines cannot be maintained. Golden Pyrethrum is one of the worst offenders, and the sooner this is dispensed with in favour of the slower-growing if less bright sorts the better. When the flower stem of the Pyrethrum commences to form this must be pinched hard back, while all the side leaves require to be plucked with the hand in such a manner as not to expose the stalks, and also to preserve the fine line of yellow. The Alternantheras require little or no attention, as these seldom grow strongly; and all that is necessary is to pinch back any irregular shoots. Mesembryanthemum cordifolium variegatum grows strongly in nearly all summer weathers, and must be freely stopped, regulated, and frequently thinned out where very thick, or it will spoil the design. Iresine Herbstii to be pegged down, stopped if necessary, and receive but little water, or it may grow too strongly. Any of the very dwarf Ageratums, and which are very effective and durable carpet bedding plants, that may be inclined to lose their character and grow rankly, should at once be removed, their places being filled with plants held in reserve. Lobelias are particularly bright at this time and during August, but later on they become weedy; there is no possibility of preventing this. The groundwork plants, such as Herniaria glabra and its golden variety, Sedum glaucum, Sedum Lydium, Veronica repens, Mentha Pulegium gibraltarica, and Antennaria tomentosa when once they are established are apt to grow too strongly and require to be regulated very frequently, or otherwise they will smother their less vigorous neighbours. Any that are too thick, and perhaps too high, can be regulated by plucking, followed by a pressing or patting down with the hand. All can be kept within bounds with the aid of hand-shears or old knife, and blanks may be made good by taking up some of the strongest pieces, dividing these, and replanting. They may be also encouraged to spread by occasional pressing down with the hand, thus inducing the side shoots to strike root and grow more strongly. The flower stems of Echeverias spoil the neat appearance of the beds, and should therefore be removed, neither should any of the stronger succulents be allowed to flower.

Annals.—These now require attention, especially in the way of thinning, where at all crowded. If such kinds as Poppies, Love-lies-bleeding, Candytufts, Convolvulus, Eschscholtzias, Sweet Peas, Mignonette, Cornflowers, Corn Marigolds, and various other strong growers are not freely thinned out they only spoil each other; whereas if given plenty of room each reserved plant will grow strongly, branch freely, and continue to flower till long after those left in a crowded state have collapsed. The seed pods on Sweet Peas if left on the plant quickly stop further growth, but if kept closely picked off, the plants, provided they have good soil to root into, will continue to flower till cut down by frosts. Ornamental Grasses generally germinate freely, and these to be good must also be freely thinned out.

THE BEE-KEEPER.

NOTES ON BEES.

SPREADING BROOD—OUTSIDE CASES.

OWING to the most untoward weather in May and June, which caused the death of so many bees in some localities, the hives were as strong then as they are now. They have, however, gathered and stored more honey at this date than they have done for many years, and should the weather continue fine for but eight or ten days there will be an abundant harvest, especially from hives of the Stewarton type.

I have previously given my experience on the superiority of the Stewarton hive over ordinary frame hives, showing that no single-frame hive is so suitable for bees as is the Stewarton. A frame hive to be large enough for the internal economy of the hive is too broad, therefore badly adapted for keeping up a uniform temperature. My apiary is open for inspection to all who have a desire, and many visit me, but for the benefit of bee-keeping readers I may state how my hives stand at this time.

As is well known, I do not advise manipulating hives unless in cases of necessity. Last autumn, as is my custom, I arranged my hives and covered for the winter, making sure that they had sufficient stores to last till there was a likelihood of the bees getting honey from the flowers. The result is all my Stewarton hives are rapidly finishing their second super, while my frame ones are only at their first one. There is, however, one exception—that is, those crossed Cyprians, both the stock and swarm of this hive are very heavy, and rapidly, more than any others, filling supers. Surely after this no other proof need be sought for to establish the superiority of the Stewarton hive. But this is not all. Just over the hedge are twenty hives, and the Stewarton hives are ahead as they are in my own case. I am also in possession of several letters from a distance saying their Stewarton hives are occupying six supers, the difference in our cases being that their locality is more favourable for bee-keeping than ours, and is a substantial proof that the superiority of any hive can only be established by a fair test in the same place.

It will perhaps please the advocates of spreading brood to learn that the superiority of our Stewarton hives is due to this process, not by the hands of man, but by a natural process, because the only manipulation I have made since October was putting on supers, and an examination lately to see the progress.

The advanced state of our Stewarton hives came about in this way, and is what I have long taught. During the very cold weather in May and June, for upon the 25th morning of June the thermometer stood at 30°, and we had colder mornings, but on the 27th day it rose to 81°, variable enough. During these cold times the bees in the narrow Stewarton hives with sufficient stores could keep up a proper degree of heat for hatching brood, and continued to spread the brood downwards, and increased accordingly, without attempting to destroy eggs and larvæ as did those in frame hives. So it seems after all that spreading brood is right if well done, but it is quite apparent that the downward or vertical course is the proper one.

I think I stated in a previous article that as the most of my stocks were full in early May that brood-spreading then was impossible; but though it had, would it not have been very injudicious to spread brood at so early a date? The result could not have been other than failure, as has been fully exemplified in the following cases. It is surprising how bees with a queen can be tided safely over winter. I kept three nuclei with but a few bees; one filled the place of a deposed queen, and the other two progressed steadily, and now they are strong stocks. They covered in the beginning of June eight combs only, while all the others were crowded. At that date, 8th of June, ten really fine days were all the bees had got this season, and at this date they had three of them, which set many supered hives swarming, and caused the hives not full to extend or spread their brood. I kept a careful watch on the weather and movements of the bees, not for the purpose of getting information, but to be able to give evidence from a reliable source. On the 6th day of June I examined the two nuclei, and found them covering seven combs only. A second examination on the 8th, they had extended or spread their brood to the ninth comb. Surely if brood-spreading is an advantage, and can be performed with safety at any time, the 8th of June should be the time. In this case the queen spread the brood herself, expecting the bees to take care of it, which no doubt they might have done had the weather continued

mild, and more so when it was done naturally than by the hands of man. The next examination I made on the 26th June, and instead of the brood being cared for and hatched, it was reduced to six combs in both cases, thus establishing the fact that spreading brood under any circumstances is a great mistake, and proves the theory of spreading brood to be entirely wrong. Had these bees been located in a Stewarton hive the change of temperature would have been less felt inside, and the progress would have been much greater. I have been engaged in the "battle" of the hives for the last thirty years, and had much opposition while defending the Stewarton type, but as my opponents are now one after another adopting the system, it is a proof I have been on the right side, and I know the same will follow with the spreading of brood.

A very great amount of information, which enables me to speak positively on some things, is brought through the post. One of these letters reminds me that I have a promise to fulfil about outside cases, but before doing so will give here verbatim quotations from three that came by the same post. The first is, "Please send me 3 lbs. of your comb foundation for a super." Second, "Please to forward me one of your six-sided octagon boxes for breeding purposes." The third letter says, "I have forwarded by parcels post a hive with a ventilating floor which I made for it." This hive is for the purpose of receiving a second swarm of Carniolian bees, directions follow, and is a practical letter. The ventilating floor is made after my style. It is a rim of wood $2\frac{1}{2}$ inches broad by 1 inch thick, covered with tinned wirecloth, and has a tunnel closed at one end for the mouth. A swarm of bees might travel in it several days at this season in perfect safety. The rim is made in one piece, which is objectionable, being a waste of timber and liable to warp. A better way is to cut it into segments from half-inch wood the number required to complete the circle twice, then nailed together, breaking the joints one with the other; now nail the zinc on one side, and fillets with sliding shutter on the other. Then take four pieces of hoop about 5 inches long, punching holes at the proper distances, so that one shall be opposite the floor after the lower end has been turned at right angles to go beneath. The next hole should be opposite the centre of one of the rolls of straw so that a wire nail may pass into it and hold the floor rigid to the hive; at a little distance from the upper end another hole to rivet a little hook for the purpose of attaching strings to hold the supers rigid. A hive so rigged out is easily completed to travel with safety to the moors, both as regards non-escape of bees and ventilation.

We are very often told to invert hives when taking them to the Heather, what I have done for nearly forty years with hives in spring or autumn, and when placed in a hamper with wirecloth on the crown and cheesecloth on the mouth, skewer down, and a lid over all. There is no better plan for some days' journey when the hive is in charge of steamboat and railway officials, and often under cover, but it is a very different thing when removing bees to the Heather. Hives capable of being inverted are not worth the trouble; besides, the bees of an inverted hive run the risk of being drowned if heavy rain is falling, or if the sun is very hot the combs may be melted. For safety keep the hive in its original position, fitted with a ventilating floor, also ventilated at top. All outside coverings of metal are bad unless ribbed to allow a free circulation of air around the hive; the same applies to all non-porous coverings. These few hints may be of advantage to those who for the first time are thinking of moving their bees to the Heather, and I may chime in with your excellent correspondent "Felix," and advise everyone to count all cost, and as time is money, purchase the most useful and at same time the cheapest appliances. If some hives bring bees to the highest strength without manipulation, and earlier than some that require it choose these hives.

The demand for Stewarton hives and of their type has been greater this year than has ever been. One reason of this is, bee-keepers find some hives are too unwieldy and expensive to travel. The only drawback is the cost of outside cases. In many instances these cost more money than the hive, and the variety is so great that makers do not know well what is likely to please their customers. Then covering with straw makes the apiary untidy, and to those who do not grow it expensive. I have numerous inquiries, What is the best covering for hives? A cheap yet neat and effective outside case for any hive can be had for 6s., or thereabout. Either octagon or square can be made; the former takes much more labour and is more expensive, but for a square case from 2s. to 3s. will purchase material to make one 2 feet high by 1 foot 6 inches inside, four posts 2 feet long by 2 inches broad by $1\frac{1}{4}$ thick, and four fillets half-inch square for the outside angles of the case, and closes the ends of the lining, which is in length 1 foot 6 inches by 4 by $\frac{1}{4}$. These

thin boards overlap each other about half an inch, the under edge is bevelled inwards to form a drip. As the boards do not lie quite close, it is a great advantage in allowing a free circulation of air on the packing, keeping it and hive always perfectly dry. The rim of the roof, which is a span, is five-eighths thick, and has a rebate in the inner edge to give a lap, same as lining, and prevent wet entering; the lining is of some material, and when covered with zinc and painted will last a lifetime, while the lightness must recommend itself to many.—A LANARKSHIRE BEE-KEEPER.

TAKING OFF SECTIONS.

"A LANARKSHIRE BEE-KEEPER" is always so obliging in helping his brother bee-keepers that I take the liberty of asking for a little information.

In taking off sections some people say take off each as finished without disturbing the crate or hive; but I find it impossible to do this, so wait until I think the crate is finished and take it off, and take sections out after a distance from the hive. When I take off the crate, and before I have time to replace another, the bees crowd the top bars, so that it is almost impossible to put on the crate without crushing a lot of bees, and what I wish to know is how I can prevent this. A few days ago, on taking off the crate, I at once put a quilt over the hive, on which I sprinkled some carbolic acid. This kept the bees down completely, but when I put on the crate again it was two or three days before the bees entered the sections, and I fancy it was the smell of the acid left after the quilt that caused this. Is it so? Perhaps I used too much. Kindly say how to manage in such a case to keep the bees out of the way, do you use the acid pure, or mixed with water?—if the latter, in what proportion? Also say when you want to add a second or third crate, do you put it on the top or underneath those already on the hive?—F. J.

[In using carbolic acid care should be taken neither to smear the bees nor in such a quantity as to make the hive disagreeable to them. I use the crude carbolic acid sold for sanitary purposes, and never dilute it. I think the way "F. J." used the acid on the quilt was quite right, especially as the quilt would be removed before another crate of sections was put on. To carbolicise brown paper and slip these between the sections will effectually clear out every bee in a few seconds. There are different sorts of crates and racks for holding sections. The best I ever used, and which I exhibited at Edinburgh in 1877, consisted of an outer case containing frames, minus the top bar; but then it did not meet the approval of the judges, but is now generally recommended. Sections in such a crate and frames can be examined and removed with ease, but those who teach the removal of sections as they are finished and replace with empty ones have a great deal to learn. I have always practised giving one super as the previous one has been well begun, and the last-put-on one always on the top, otherwise, should the weather become unsettled, comb-building ceases, and not unfrequently the bees carry the honey down, causing waste and disappointment. Instead of bees finishing a few sections for the accommodation of the bee-keeper to remove, not unfrequently they have from 100 lbs. to 200 lbs. in a progressive state, and the honey season is often at a close before a single super is really well sealed and ready for removal; therefore, those who attempt to get sections finished "piece-meal" fashion lose the abundant harvest they would otherwise have.

The reason the bees did not take immediately to the new crate of sections may have arisen through the discontinuance of the flow of honey in the flowers, or what is more likely, and what I have frequently explained is, bees seems to dislike entering sections by the obstructionable under broad rail. If this is the case, as I believe, then it is apparent that a great loss is caused by their use, as I have often observed. Why, then, not discontinue their use and adopt supers, which are as cheap as sections in the first place, and require neither racks, crates, packing cases, or the greatest invention out—a second section to envelope the first one? I do not know a single practical bee-keeper nor a honey merchant who approves of sections, while in a commercial point of view supers are preferable and more profitable to the bee-keeper.—A LANARKSHIRE BEE-KEEPER.]

TRADE CATALOGUES RECEIVED.

J. Carter & Co.—Seed List of Florists' Flowers, Fruit, and Vegetables.
W. & J. Birkenhead, Sale, Manchester.—List of Hardy North American Ferns.
W. Lovel & Son, Driffield, Yorks.—List of Strawberry Runners.

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We

request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Address (Vectis).—The address you require is the Thames Bank Iron Company, Upper Ground Street, London, S.E.

Strawberries (W. Lovel & Son).—The fruits were of good size, but had suffered so much in transit, being much bruised, that we cannot speak favourably as to their condition or flavour.

Imported Orchids (W., Reading).—The book you mention does not include the culture of Orchids; you will find ample instruction in Mr. B. S. Williams' "Orchid Manual." The treatment you are adopting is correct and we can advise nothing better, but when the roots are growing you can place the plants in well-drained pots or baskets with moss and a small quantity of fibrous peat, growing them in a temperature which does not fall below 55° nor rise above 65°, until it can be decided what the plants are.

Exhibiting Stocks (R. S., Balmoral).—If the prize was offered for the best "blooms" of Stocks the award was, strictly speaking, right; but it is the duty of persons who offer prizes or prepare schedules to take care that the conditions are so clear that they cannot be mistaken. The flowers of Stocks taken from spikes are "blooms" just as individual Roses are that are cut from a stem bearing many flowers.

Strawberry Depredators (Uxbridge).—Your Strawberries are "taken," we suspect, by either rats or mice, and not by either toads, frogs, or birds, and you should destroy the vermin by traps or poison, but the latter should be used with care, as domestic animals or birds may be destroyed also.

What is an Herbaceous Plant? (Joseph Law).—We consider that all plants are herbaceous that lose their stems annually and spring up again from the roots. According to this definition your plants would be eligible for competition. The wording of the class is, however, very loose, and the judges might either understand that hardy plants were meant, or that the word "distinct" meant distinct kinds. Your plants were not distinct kinds. Still if we had been judging such a class we should not have disqualified you if the varieties were distinct, on the ground that an exhibitor should not be punished for any mistake in the published conditions.

Aphides on Gardenias (Subscriber).—If all the shoots are infested like the one you have sent there is only one method of restoring the plants, and that is to cut them down, wash the stems with an insecticide, keep the plants in a very warm moist house to break, then repot, removing much of the old soil from their roots—in fact all that is loose, and encourage fresh growth in brisk heat, and keep the plants clean by daily syringings. The specimen is in a deplorable state, and nothing can possibly make such a shoot healthy. Aphides can be destroyed with Gishurst compound, Fir tree oil, nicotine soap, or soft soap and petroleum; but it is of no use wasting time and material on shoots in the state of the one before us, which should be cut off and burned.

Apple Bess Pool (A.E.).—Your Apple is a good example of the above well-known late-keeping variety. Its origin is thus described in the "Fruit Manual." "This is a Nottinghamshire Apple. Mr. Pearson of Chilwell says, 'My father became so in love with the Bess Pool that he planted it largely. He used to tell how a girl named Bess Pool found in a wood the seedling tree full of ripe fruit; how, showing the Apples in her father's house—he kept a village inn—the tree became known, and my grandfather procured grafts. He would then show the seven first-planted trees of the kind in one of our nurseries, tell how Loudon had been to see them and given an account of them in his *Gardener's Magazine*, make his visitors try to clasp round their boles, and measure the space covered by their branches. He would then boast how, one season, when Apples were very scarce, the fruit of these trees was sold at 7s. 6d. a peck, and made £70, or an average of £10 a tree. So far from thinking the Bess Pool a regular bearer, I believe it to be a very uncertain one, and anything but a profitable one to plant.'"

Chrysanthemums for Exhibition (Wordsworth).—Successful exhibitors o blooms grow several plants each of what they consider reliable varieties, and they do not treat them all alike as to "taking" the buds, because they do not know what the weather will be in October and early November. What you term a "summer" bud (crown bud) develops a larger flower as a rule than a terminal bud does, and a side bud on a terminal growth produces a smaller flower than the end or central bud of the cluster. For your district we should set at least a number of summer or crown buds if they showed towards the end of the first week in August. That would probably be right for all except the early varieties, and the blooms even of some of these might keep if the season were late. As you cannot make buds form when you like you cannot do better than remove promptly all buds that form towards the end of the present month, and rely on the first buds that show afterwards, removing very carefully all growths and buds surrounding the most prominent at the end of each shoot as soon as this can be done with the point of a penknife; but remember the buds retained must not be touched, as the smallest possible injury inflicted on them is certain to grow and spoil the blooms. Nearly all the largest blooms that are exhibited are from "crown" buds, and amongst the varieties likely to be too early if "set" during the first week in August are what are known as the Rundle trio, Prince Alfred, Lord Wolseley, Prince of Wales, Mr. Bunn, the Beverleys, White Globe, Lord Derby, St. Patrick, and Beethoven, and these would be safer taken a week or so later. But do not put all your eggs in one basket—that is, treat all the plants of a variety exactly alike.

Pruning Roses in Summer (Kittie).—Climbing Roses that are permitted to extend to a great length when young, the shoots 6 feet long or more, and not shortened in winter, are almost certain to get naked at the base

as the lower buds will either not start at all or grow weakly. It is better in the end to proceed rather slowly at the beginning by shortening at least some of the shoots to within 2 feet of the ground. It is by adopting a similar practice with Vines that they are furnished with growths quite as low down as is desired. In the case of the Gloire de Dijon, with a bare stem of 4 feet and a spreading growth above that height, with a luxuriant growth starting from near the ground to near 6 feet high; there are two methods of dealing with the latter: top it now, and in winter shorten it to within 18 inches of the base, and in the spring it will push four or five growths that may be distributed over the lower part of the wall. 2, Let it extend through the season, and in winter bend it under the present branches and train it down the other side of the stem to the ground. By this plan you would have flowers next year on the lower part of the wall. We cannot say what the growth would be afterwards, as this depends entirely on the vigour of the tree. We may say that if the tree were ours we should have cut 6 inches off the young shoot when it was 2 feet in height, and should now have young shoots—second growths—growing up the wall. This is, in fact, exactly the result in the case of a rampant shoot of Gloire de Dijon that we topped a month ago. We take off the tops now of strong sucker-like growths of dwarf Roses with the object of distributing the sap through others that are weaker, and thus secure a uniformity of growth. If the top part of the Rose is rather weak, we should not allow the strong shoot to proceed further. Your Clematis Flammula will not flower this year if you prune it now; we cannot say whether it will do so if left alone, but as a rule the more it is pruned the more sparsely it will flower; still the lower part of the wall has to be considered, and if persons were willing to wait for flowers a little longer the lower parts of Roses, Clematises, and other climbers would be better furnished.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should contain spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once. (D. C.).—1, *Cynosurus cristatus*; 2, *Festuca pratensis*; 4, *Poa pratensis*; 6, *Festuca duriuscula*; 7, *Medicago maculata*; 3 and 5 are unrecognisable. (G. R. B.).—*Sollya heterophylla*, a New Holland plant generally grown in a greenhouse in England. (Young Beginner).—*Jasminum Sambac flore-pleno*. (A. B. C.).—1, *Asclepias tuberosa*; 2, *Achillea Ptarmica flore-pleno*; 3, *Hypericum perforatum*; 4, *H. calycinum*.

THE CLERGYMAN'S FARM.

"No spiritual person licensed to perform the duties of any ecclesiastical office whatever shall take to farm, for occupation by himself, any lands exceeding eighty acres in the whole for the purpose of cultivation." So runs the Act 1 and 2 Vict., with the obvious intention of keeping our spiritual pastors from becoming too much absorbed in things temporal; but we think an allowance of eighty acres by no means despicable, for it affords ample scope for the cultivation of a bountiful supply of farm produce that should more than suffice for the requirements of a clergyman's household.

What to do with the glebe land is frequently so great a puzzle that the difficulty is often got over by letting the land to a farmer. Yet with a taste for rural pursuits there should be no great difficulty in the acquirement of a sufficient knowledge of farming to enable one to derive both profit and pleasure from it—profit in the primary sense of obtaining as much home produce as possible for home consumption, and pleasure in the cultivation of really useful crops in the best way. We know at least one country rector whose boast it is that he has an ample supply of home-grown corn, roots, fodder, fruit, vegetables, as well as poultry of all kinds, eggs, home-cured bacon and hams, and dairy produce from his farm. The clergyman's farm is, therefore, a home farm in the full sense of the term.

Of corn crops there should be a due proportion of Wheat for grinding for flour for the household, the bran always being useful for animals, cows being especially fond of it. With Wheat at the present low rate it is not desirable to have any considerable surplus of it, but it must not be forgotten that ground and mixed as whole meal with other corn it is admirable food for animals, a mixed corn diet being wholesome, and, if given in sufficient quantity, fattening, so that bills for oil-cake may be avoided. This is an important point to keep in view. Let the farm be self-supporting, and avoid the purchase of any cattle food, and of manure too, so far as is possible. Square-head Red Wheat is the best sort for general culture; the straw is sturdy, stout, and strong, well calculated to bear erect the somewhat heavy head of corn till it is ripe. The grain is large, the yield good—an average of from 5 to 6 quarters per acre being quite possible under high cultivation—and the quality of the flour excellent. In southern counties preference may well be given to Velvet Chaff or Champion White Wheat, both for the actual superiority of the flour and for the comparatively high price which the grain invariably commands, and with a surplus the home farmer is as eager as anybody "to pick up a little money." Do not sow Champion White Wheat in a bleak wind-swept situation, for the straw is slender, and it grows so tall as to be easily beaten down in a heavy storm. We may again here mention our trial plots of Wheat, now fast approaching maturity. Of these Golden Drop is still inferior in length of straw and size both of ear and grain. Champion White is upwards of 6 feet high, with very long but somewhat slender ears; yet the crop on the whole is so full of promise that this sort will probably have a trial on a much larger scale next season. Velvet Chaff, though not so tall, is very satisfactory, its compact ears borne on stout straw giving promise of a yield of heavy grain. Square-head for straw, for ears, and for size of grain continues to hold first place, and it may always be mentioned as a safe sort to grow either upon a large or small scale.

A sack of wheat yields slightly over 3 bushels of flour, so that if we reckon our land to yield 5 quarters or 10 sacks per acre, our computation for the requirements of a year becomes an easy matter. It must not be forgotten that for a crop of Wheat to afford this high average the land must be well drained, free from foul weeds, and thoroughly fertile. Good seed must be sown either in September or October, an autumn and spring dressing of genuine home-mixed artificial manures must be applied, the crop must be harvested in as nearly a perfect condition as possible, and the threshing not be done till the grain is firm and hard. We state thus much generally now, and when seed time once more comes round full cultural details will be given again. We may now add that applying our teaching to practice we have bought no beasts this year, and all calves not kept for the dairy herd were fattened and disposed of to butchers, our intention being to trust solely to artificial manures for the Wheat, to avoid a heavy outlay for litter, the expense of a stockman, the making of mixens, and the carting and spreading of farmyard manure upon the land—all heavy items of expenditure that help to exhaust the farmer's means, and to defeat his efforts to overcome the

difficulties of low prices for his produce and hard times. Wheat, as the staff of life, has been given the first place here. Its culture, though quite indispensable upon the home farm, must be kept within reasonable limits, an undue preponderance of it or any other crop being calculated to defeat our aim of having a full supply of home-grown farm produce, so that its culture and that of all other crops must be well considered beforehand, and as we are fast approaching the end of the farming year—Michaelmas—there is ample time to do this and to arrange our plans for another season's work. In doing this we must allow a safe margin for failures arising from unkind seasons, by which results are influenced in some degree, however careful we may be; and to have a surplus quantity over household requirements by no means leads to waste, poultry, pigs, sheep, and cows all coming in with advantage for some of it.

(To be continued.)

WORK ON THE HOME FARM.

On land specially reserved for haymaking that important operation has been done well and cheaply, for though the hay crop was heavy yet sun and wind both helped us on, and there was no rain to hinder the work. There has, however, been so much late work upon pastures where stock had been kept late in spring that hay and corn harvests will, in many instances, form a continuous operation. It is certainly a moot point if it answers to so retard the haymaking; for ourselves, we certainly consider that it does not answer. We never turn heasts upon grass laid in for hay till the aftermath is ready for them, and then they continue there till the end of September. Sheep follow during winter till we apply the artificial manure in February, and thenceforward the growth is left unchecked in view of obtaining a full crop of hay. No doubt, many a farmer is driven by dire necessity to keep stock upon the hay meadows late in spring, but it would in the end prove more profitable only to keep enough animals to consume the store of winter fodder by the time a full supply of green food is forthcoming in spring from crops devoted specially to that purpose. Let our calculations in this matter be based upon the assumption that every spring may prove as late as it was this year, and then we shall be safe. A bountiful aftermath is far more profitable than a scanty spring growth, and its effect upon the dairy cows is highly beneficial. It is now that we get our best butter, high in colour and of delicious flavour, and an ample store is potted for winter use. Winter Oats are changing so fast that harvest will have begun before this note is in print. We hear many complaints of shortness of straw in Spring Oats, but there is no cause of complaint upon that score in the Winter Oats, which, as usual, are excellent both in straw and grain. Root crops are, upon the whole, satisfactory, White Turnips are sown, singling is finished among Swedes, and the horse-hoes have been in full use till the spreading foliage stopped them. It is with regret that we have seen much land left unploughed after a green crop was cleared in June or early in July. Rather than leave it in that condition we always sow another green crop either of Tares or Mustard, or a late crop of White Turnips. Green crops, be it remembered, may always be ploughed in advantageously; so, too, may Turnips if not wanted for stock. A surplus supply of Winter Tares has been used daily for the dairy cows, our plan being to throw as much as they can eat at once upon any pasture becoming somewhat bare, as is often the case just before the aftermath is ready for them. They also had some in the cribs during the milking. Young pigs held in reserve for the corn stubbles have also had a daily supply of Tares.

REMARKS.

12th.—Heavy rain early, then fine throughout.
 13th.—Dull and sultry early, bright and fresh later; thunder and lightning and rain about 9 P.M. Heavy rain in the City, very little here.
 14th.—Fine and bright.
 15th.—Fine.
 16th.—Wet in morning; fine afternoon.
 17th.—Cloudy morning; fine and bright afterwards.
 18th.—Cloudy, with a little sun about noon.
 Rather a dull week, cooler than the previous one, but very near the average temperature, and extremely equable, the maxima all agreeing within 4° degrees, and the minima within 7°.—G. J. SYMONS.

FLAVOURLESS MELONS.

IHAVE been among Melons of late, and have had to cut and taste a few dozens with the object of finding out the best, or worst, at some exhibitions. As it is not customary to stage the worst fruit at shows, the character of that to which prizes are awarded may be regarded as fairly representative of the produce of the districts in which exhibitions are held. Grapes have been very good indeed; Peaches fine, Nectarines good, Strawberries fair, but Melons bad—decidedly and unmistakably bad.

As men who can grow Grapes, Peaches, and the other fruits indicated well cannot be bad cultivators, it appears passing strange to find so many flavourless Melons staged for adjudication. The most approved varieties are grown, and the fruits good in appearance, but not one in ten has been found of even fairly good quality. Prizes have been given to fruits that certainly did not deserve them, and they were simply awarded because they were the best out of bad lots. It seems, therefore, pretty clear that the season has not been good for Melons, at least in some localities, and it may be worth while endeavouring to ascertain the cause of their general inferiority.

In the "olden time," before garden structures were heated by hot water, Melons were almost exclusively grown in frames on beds of fermenting materials. To cut Cucumbers in March and Melons in May was considered good work in those days, and if gardeners of the present, with no other aids than those mentioned, succeed in doing the same, they will not find it very bad work now, provided the Melons are of first-rate quality.

It was customary in those days to lessen somewhat the water supply to the Melons when the fruit was approaching the ripening stage; and there was reason for this, for the roots of the plants often took possession of the manure, and the growths were supplied with all the support they needed, and as much moisture as the foliage could assimilate; in other words, water could be reduced without the leaves of the plants flagging in the slightest degree, and they were kept stout and fresh throughout the ripening process. Had the foliage "given way," the drying would have been overdone, and the fruit most certainly inferior in quality.

Under the old method of culture, and the great pains that were taken in maintaining the requisite heat by linings, and the atmosphere suitable for the plants by ventilation, it was not common to find either red spider or any other insects on the foliage. The moisture and ammonia were natural deterrents of those enemies which have a disastrous effect on the flavour of fruit. At the time of fruit ripening the foliage should be in the best possible condition for performing its functions, and must not be obstructed in its important work by insects, as, if enfeebled, the supply of sap is checked, and the quantity is altogether insufficient for adequately supporting the fruit, and at the same time the sap which is supplied remains crude, as it must of necessity

do in the absence of leaf power for its purification and the secretion of that which alone can result in well-fed fruit of superior quality. It is useless to expect high flavour in fruit that is "nourished" by crude or imperfectly elaborated sap; and it is not possible for a sufficient supply to be provided nor what there is to be prepared in the laboratory of Nature when that laboratory, the foliage, is inoperative, either by the devastation of insects or an insufficient supply of water to meet the great evaporation that is in constant operation under a powerful sun. Whether the juices of the plants are extracted by insects from the leaves or escape into the atmosphere, the effect is the same—insipid or unpleasantly flavoured fruit.

It is surprising how old customs that are handed down traditionally from generation to generation cling to individuals who have inherited them without considering their applicability to the changed circumstances of modern practice. It does not follow that because it was desirable to "dry off" Melons—which, in the old days, had 4 feet of rich moist manure to root in—it is desirable to withhold water similarly at a critical time when the roots are warmed by the dry heat from hot-water pipes. On the contrary, a practice that may be right in one case may be utterly wrong in the other; and it is wrong, absolutely wrong, to withhold water from Melons when the fruit is approaching the ripening stage to the extent of causing first the flagging and eventually the total collapse of the foliage. Yet this is what is done in hundreds of gardens, and then surprise is expressed at the ill condition of the fruit. It would be surprising if it were otherwise. Without good, stout, clean, well-developed and, consequently, well-supported foliage, there can be no well-nourished and highly flavoured fruit, whether of Melons, Grapes, or anything else that grows; but the evils arising from enfeebled leaves by lack of moisture for their sustenance is in no fruit more manifest than in Melons. The fruits are, in fact, bad or good as the foliage is bad or good. The one is the correlative of the other, the natural effect of a visible cause. Still, cultivators—not all, but by far too many of them—go on "drying off," just because their fathers did so before them, but who worked under essentially different conditions, and even then took care never to allow the leaves of the plants to shrivel until the crops were ripe.

I have noticed, as others must have observed, that Melons staged at exhibitions are not, as a rule, good in very hot and dry seasons. A few fruits may be found of great excellence, but the majority are defective in flavour. I have further noticed that in such summers as this that the average quality of the fruit is higher in the north and western than in the south and eastern districts of the kingdom; but in dull and wet summers the reverse is the case. This shows that sun is essential and—do not forget it—moisture too. With adequate support ensuring first-class foliage and maintaining it by adequate support and judicious ventilation, the hotter the summers are the better Melons should be.

In the South-western States of America they are grown in fields where the subsoil is moist and the water level not many feet below the surface. The seed is sown in the open, where the plants grow and fruit, and the hotter the summers are the richer is the fruit, the sun there being much more powerful than it ever is in Britain; but it just draws up the moisture in great quantities from the reservoirs of Nature, and the plants and crops are benefited accordingly.

A few years ago Mr. Taylor, then of Longleat, sent a fruit of the Cashmere Melon to one of the meetings of the Fruit Committee of the Royal Horticultural Society at South Kensington, and it was unanimously considered one of the best that had ever been tasted there. I know that it was good because I was one of the "tasters." The summer was hot, and the plants at Longleat were, I believe, watered like Cucumbers. There was no drying of the soil to "develop flavour" and destroy foliage. That year the Melons at the Crystal Palace Show were, as a rule, wanting in flavour. I

tasted between five and six dozen of them—an unenviable duty—and only very few were good, the majority ranging from moderate to bad. That same season an American Melon grower was in England—a grower of tons of fruit. He purchased several, with the object of finding some superior variety and saving the seed, but without avail: and the only fruit that he considered really good, and the seed from it worth taking home, was grown at Longleat on what may be termed the Cucumber system—that is, supplying the plants with all the water that was requisite for keeping them growing throughout the whole process of ripening the crops.

Overcropping is fatal to high flavour. If the plants cease growing before the fruits attain half the size they should do, it is practically impossible to retain the foliage, and in that event it is hopeless to expect high-class fruit. The crops should be so regulated that the plants can do something more than support it—namely, make at least some fresh growth; then if the leaves are fully exposed to the sun, not overcrowded nor injured, and the roots are “kept moving,” first-class Melons may be relied on if the variety is good. There is yet time to avert the collapse of the foliage of many plants, and consequently to improve the fruits they are bearing; hence these notes by—A JUDGE.

SOME NEW ROSES.

Now that the Rose shows are nearly over the question begins to be asked, Are there any new Roses worth having? and the following notes made during the recent flowering season may be relied on, at least as having been made from growing plants that I have flowered. Perhaps the simplest plan will be to begin with the most recent introductions, and start with the most widely known, “the yellow Hybrid Perpetual.”

GLOIRE LYONNAISE (Guillot).—This Rose is of considerable horticultural interest, as being the first Hybrid Tea which, with a habit of growth that would suggest its being classed as a Hybrid Perpetual, still retains in its flowers the yellow colour of a Tea Rose. The colour may be more exactly described as white shaded with sulphur. Both habit of growth and form of flower are of the Captain Christy type; wood very close-jointed, flowers solitary. It is a good grower and free-flowering, and even if hardly large enough for exhibition, will probably make a very pretty bedding Rose.

SOUVENIR DE GABRIELLE DREVET (Guillot), is a Tea Rose which promises to be a very distinct addition. The plant, of sturdy upright habit, produces a deep-petalled flower, of good size, in colour something between Grace Darling and Madame de Watteville, having a whitish petal shading to coppery yellow at the base and tinted with rose at the margin.

MRS. CAROLINE SWAILES (Swales).—A sport from Eugénie Verdier of a very delicate shade of flesh-tinted rose, appears very free-flowering and invaluable for cut flower work.

Of the Roses distributed in England in the spring of 1884, taking them in alphabetical order—

ALPHONSE SOUPERT (Lacharme), is an H.P. which has already proved itself a fine exhibition Rose. The plant is vigorous and truly perpetual, its large deep-petalled flowers of a bright rose colour being very freely produced both in summer and autumn.

ANTOINE MERMET (Guillot), is yet another red Hybrid Tea of no very distinctive character.

BENOIT COMTE (Schwartz), seems a good vigorous red H.P. of the type of Alfred Colomb, but distinct in colour.

COLONEL FELIX BRETON (Schwartz), is another promising dark H.P.

ECLAIR (Lacharme), promises to be a fine and distinct addition to the dark H.P.'s, having a deep built-up flower large, and of a most brilliant fiery crimson colour shaded darker; in fact, a well-shaped Duc de Montpensier.

ELLA GORDON (Wm. Paul), is a pure crimson lake self-coloured H.P., becoming cherry colour on fully expanding; of good habit and promising.

ETENDARD DE JEANNE D'ARC (J. Margottin fils), is a pure white Tea of the Gloire de Dijon race, but without the rambling habit of its parent; rather rough and coarse in early summer, but better in autumn, as with Souvenir de la Malmaison. In fact the plants of this Tea now in full bloom look, at a distance, very like Souvenir de la Malmaison without the blush tint, offering an additional indication perhaps of the Bourbon origin of Gloire de Dijon.

GRACE DARLING (Bennett).—Whether regarded as a pure Tea (as which it was sent out), or whether eventually classed as the Hybrid Tea that some have asserted it to be, this Rose is sure to become popular; it is among the first to begin flowering and the last to leave off, of vigorous handsome habit, with full-sized highly finished flowers really distinct in colour, the petals shading to coppery yellow at the base and rose colour at the margin. It has qualities that will make it appreciated by every class of Rose-growers.

JOSEPH METRAL (Liabaud), is a very good flat H.P. to avoid.

LADY OF THE LAKE (Wm. Paul), is a flower of a very pleasing peach colour, but the plant though exceedingly vigorous is unfortunately not perpetual flowering.

LOUISE CHRETIEN (Liabaud), is a circular cupped H.P. of a bright rose colour and of good habit.

MADAME DE WATTEVILLE (Guillot), is a beautiful and distinct Tea of vigorous erect habit, and very free-flowering. The blooms are of good size, with pointed centre, white, margined and washed with delicate rose colour. A real acquisition.

MARSHALL P. WILDER (Ellwanger & Barry), is a bright red H.P. of the Alfred Colomb type, which, if distinct, will prove a valuable addition. The flower is large and very bright, the habit vigorous, and the variety is really perpetual flowering.

MARY BENNETT (Bennett), is a very beautifully finished rose-coloured H.P., with splendid petal of great substance, of rather dwarf habit, but quite distinct, and of a pure shade of colour that is wanted.

MRS. GEORGE DICKSON (Bennett), is a very vigorous H.P. of a distinct and pleasing shade of pale rose, which successfully resists mildew, but my plants were cut by spring frosts and many of the first blooms spoilt, while the second blooms are not yet expanded, so that I have not yet grown flowers of this variety so fine as I have seen of it elsewhere.

PERLE D'OR (Dubreuil), is a very pretty coppery-yellow Polyantha, ever-flowering and most useful for bouquets, and with “Mignonette” and “Ma Paquerette” makes a charming trio for the garden.

PRESIDENT SENELAR (Schwartz), is a dark H.P., very pretty in the bud, in which state, being free-flowering, it is very good for bouquets, but it is hardly large enough for exhibition, and also has a tendency to open fat.

PROSPER LAUGIER (E. Verdier), has, so far, been one of the best H.P.'s of the year, being of vigorous habit, with handsome foliage, and having large flowers of bright deep maroon colour without shading.

SECRETAIRE NICHOLAS (Schwartz), is a fairly good dark H.P. with purple shading, of good size and form.

SUNSET (Henderson, New York), is a Tea Rose whose praises have been much sung. At any rate it is most free-flowering, every growth bringing bloom, while the colour is a pleasing shade of deep tawny yellow. The buds have been charming, but here the expanded flowers have not been quite so satisfactory. That, however, is probably owing to my want of skill, and I hope next year to find this sport from Perle des Jardins established in the front rank of Teas, as the Rose has evidently plenty of substance.

Although not quite *apropos* of a new Rose, I cannot help expressing surprise at the strictures passed by Mr. J. Muir of Margam upon A. K. Williams. Here it has this year been the most dependable and perfect of all the red Roses, upwards of thirty blooms having been staged in winning stands, and from the constant and unflinching service that this variety always renders me all through the season, I should not have the least hesitation in selecting it as the best and most beautiful of the red Roses. At the same time it cannot reasonably be expected that Roses of the imbricated type should stand so well after a journey in a baking summer like the present as in cooler seasons, since the great heat causes the outer petals to recurve, the flower thereby losing size as well as texture.—T. W. GIRDLESTONE.

LILIES AMONGST ROSES.

FORM and colour are charmingly contrasted when the stately stems of *Lilium candidum* rise amongst the glowing colours exhibited by the standard Roses. Then the flower and plant of light stands like a pure sentinel beside the celestial rosy red of the rival queen, both are peerless. *Lilium candidum* delights in rich soil, and profits by the liberal support accorded to the Rose, which it does not appear to shade or injure in the least. Slugs and snails feed greedily on Lily leaves, and must be searched for and destroyed in early spring and summer.

I wish I had seen sooner your correspondent's information, on page 75 of the current number, about the removal of the anthers. I had noticed a Lily sold in London without anthers, and certainly for transit such a

practice is advantageous. Sending a day or two ago a quantity of these Lilies to adorn the last resting place of our loved and learned Bishop Wordsworth, I was disappointed that the golden dust shook about all over the petals.—A. M. B.

MUSHROOMS ON RIDGES.

I FELT flattered by your kind mention in the Journal of our Mushroom ridges. It is my first attempt at this method of culture. My employers were anxious to give the plan a fair trial, but I had great reluctance about spending so much money at the first start. However, I studied Wright's book and acted on it to the best of my limited intelligence, only departing from it by making one-half of our beds 3 feet wide and 3 feet high. The larger beds did the best. Three beds entirely failed with me, the cause of failure I have not yet found out. The beds made before and after all did well. I will now submit to you the financial statement.

We made 164 yards of beds, of which 42 yards failed.

164 yards cost in manure	£	s.	d.
Labour, including carting manure, gathering, and packing the crop	22	6	6
Spawn	10	18	0
Rent of land	1	0	0
	£52	17	7

Mushrooms gathered from 122 yards of beds.

	£56	17	10

Value of manure in spent beds at 1s. 3d. per yard

Leaving us a profit of £61 2 10

Had the whole of our beds succeeded we would have had a much larger profit. Col. and Mrs. Gascoigne have been testing the matter for the benefit of their tenantry, and to show that it can be made a profitable undertaking.—JAMES DUNN, *The Gardens, Parlington.*

[As a first attempt at growing Mushrooms on ridges in the open air, and entirely from printed instructions, Mr. Dunn must be congratulated on the results notwithstanding the failure of the three beds, and he evidently under-estimates his intelligence. His experience in the work appears to have been "limited," but the intelligence he has displayed cannot be so described. As is stated on page 33 of "Mushrooms for the Million," larger beds than made by Mr. Barter are under certain circumstances and in northerly districts advisable, and Mr. Dunn's experience on this point should not be overlooked, but the cost is necessarily increased. The cost of 164 yards of ridges 2½ feet wide and high, including all other expenses of culture and marketing, would be £49 4s., as against £52 17s. 7d. with larger beds in Yorkshire. The value of the produce from 122 yards of productive ridges is £3 2s. 10½d. greater than that recorded as obtained by Mr. Barter, so that the difference between the expert cultivator and the "beginner" only amounts to 10s. 9d. This is sufficient testimony that the profits arising from a well-conducted system of Mushroom culture have not been over-estimated. Colonel and Mrs. Gascoigne are thanked for having fairly tested the system, and Mr. Dunn for carrying out their instructions so well.—J. W.]

BORDER CARNATIONS AND PICOTEEES.

THE annual displays of special groups of plants in Messrs. J. Veitch and Sons' Nursery, King's Road, Chelsea, at different seasons of the year attract numerous visitors, but one of the best of the summer shows is that constituted by the extensive collection of Carnations and Picotees in beds, and which is now in admirable condition. It is indeed only from such exhibitions as this that an accurate idea can be formed of the charms these plants possess; and though the conventional shows of blooms are beautiful and represent the finer properties of the flowers, much is lost in the unavoidable formality of their arrangement in stands. In beds, if the plants are neatly but not too rigidly staked, their natural grace is seen to the best advantage, and what a wealth of blooms they yield, varied in tint, and delightfully fragrant! There is another point in favour of this mode—namely, that numbers of useful and handsome varieties can be so grown that would not be admissible for exhibition purposes owing perhaps to some slight roughness that a strict florist would regard as an imperfection, but which a lover of flowers with less technical knowledge would not notice. Some of the most refined of the exhibition varieties are of delicate habit and increase very slowly, being in consequence unfitted for beds, where healthy masses and flowers by scores are required.

Carnations and Picotees are also distinguished by a quality which renders them of especial value to dwellers in towns or their suburbs, and this is their smoke-resisting power, which enables them to thrive luxuriantly where comparatively few other plants of equal attractions can exist. This recommendation cannot be over-estimated, and in no respect

has the popularity of the plants increased so rapidly of late years as for this purpose. There is, however, still abundant room for advance, and hundreds of persons with small gardens who are doubtful what to grow could not make a better investment than in a collection of Carnations and Picotees to form a bed that will yield them great pleasure during several weeks of midsummer. For small collections a dozen or twenty varieties will be sufficient, and if a bright effect is chiefly desired preference should be given to the selfs or flake varieties amongst the Carnations and the heavily edged or yellow ground Picotees. Where a larger and more generally representative collection is required some of all sections should be included, and an astonishing range of coloration can be thus obtained.

In the following list a selection is given of the best in each section, especial attention being paid to the suitability of the varieties for borders, the strongest growers and the most profuse flowers having the preference. They are named as nearly as possible in the order of their merit, and those who only require a small collection can select one or two of each class.

ROSE BARON DE BONSTETTEN OR MONS. BONCENNE.—I should like to ask, Is it an admitted fact that these lovely Roses are duplicates? As supplied to me from Swanley they are different in foliage, and somewhat in

blooms, colour, and size of petal. Passing this questionable point, which I find different in different Rose lists, I would like to ask you, Why is the former so seldom found on exhibition lists and winning stands? In shape it is faultless, and the deep dark crimson of the thick velvety petals is unrivalled by any other Rose I know, even by the much-abused A. K. Williams or Charles Lefebvre, which it resembles in shape and vigour. A point worth remembering just now with the temperature 82° in the shade is that those magnificent Roses should be cut in the early morning, when they last four times as long.—W. J. MURPHY, *Clonmel*.

STANDS FOR EXHIBITING GRAPES.

Will you give a drawing of an exhibition stand for Grapes at your earliest convenience in your Journal? Mr. Barron in his "Book on Vines" recommends one used by Mr. McIndoe. I would like to see it illustrated.—A. SUBSCRIBER, *Co. Dublin*.

[We have not an engraving of Mr. McIndoe's stands, but the following were supplied by Mr. Inglis two years ago, and as the number containing them is out of print they are reproduced with the notes pertaining to them.]

"It is much to be regretted that promoters of fruit shows do not name the size and shape of boards or boxes upon which Grapes are exhibited. Nothing that we can place on exhibition tables creates so much interest

Fig. 12.

as Grapes, yet how often do we see them indifferently staged? Boxes and boards of all shapes and sizes, and of many angles, presenting when placed in a row a grotesque appearance when compared with uniform rows of Dahlias and other boxes which have been reduced to some sort of a standard.

"Some time ago I was much interested in watching the unpacking and staging of Grapes at a local show where they were well represented. The Grapes were a very good lot, and the majority of them were well staged, but owing to the different angles of the boards, some of which could not well be altered, they did not look so well as they might have done.

"I think the best and simplest form of box is that represented at fig. 12. The angle is 45° , and anyone can make one by the following directions. Get a piece of three-quarter-inch deal 10 inches wide by 12 inches long, cut it perfectly square at both ends, draw a pencil mark to correspond with the dotted lines in fig. 13, each 1 inch from the ends and parallel with them. This leaves the spaces, A B C D, a square 10 inches each way, and if cut through with the saw from B to D, and each set on its square, they will be of the desired angle. Upon these fix the board (three-eighths of an inch thick) for the Grapes to rest upon, which for this size will have to be about 14 inches wide. Another piece

Fig. 13.

of deal (half inch thick) 6 inches wide is fixed at the back of the stand, and rising $2\frac{1}{2}$ or 3 inches above it, pierced with two holes opposite where each bunch is to be placed, by which means they are secured to the board

with twine or tape. A very thin lath about 2 inches wide is fixed along the front, its upper edge rounded off and standing a little above the board, and similar pieces at each end forming a narrow beading all round, makes the stand look neat. As to length, each bunch should have 8 or 9 inches of board; thus a box for three bunches should be 27 inches.

"Fig. 14 shows the Grape stand in a box ready for travelling. It should be just large enough to hold the stand, should be light, and have a handle fixed in the centre of the top to carry it by.

"Fig. 15 is a simple form of board, supported behind by two legs, connected by a lath and generally held in position by a piece of twine, but instead of that it would be preferable to have short spikes as at A A, so that when on the table it can be placed at any desired angle, the spikes

Fig. 14.

keeping it from slipping about. This can be placed in a box the same as at fig. 14, the legs of the stand being laid parallel with the board.

"Some exhibitors place their Grapes on the bare boards. A better plan, I think, is to place a covering of cotton wool all over the board, leaving about an inch clear all round the outside. With a small brush apply some gum or paste just inside the beading, and have a sheet of white tissue paper ready to cover the whole of the cotton wool, and adhere to the stand round the edges. Examine each bunch before laying it on the board and place it on its flattest side, and secure it by means of string or tape, as shown at fig. 12; or if the bunches are large the tape may be placed round the junction of the shoulders of the bunch, placing the bunch higher on the stand than is here shown, at the same time twisting the stems of the bunches along the face of the upright board, so that they do not come in the way when placed in a box. When large bunches have to travel some distance it is desirable to have them secured to the board

Fig. 15.

about the middle of the bunch. Two small holes should be made in the board under each bunch, and by means of a small packing needle carefully pass a piece of narrow tape up from below through the bunch and down again on the opposite side of the main stem of the bunch, using a pencil to guide the needle amongst the berries, which must not be touched with the hands. This should be tied just tight enough to steady the bunch. The figures added to fig. 14 are the measurements of stand fig. 12 in section. If some such standard were given in our fruit schedules it would be better than leaving everyone to make their own standards."

LILIUM CANDIDUM IN WINTER AND SUMMER.

SOME years ago I pointed out in these pages the value of this Lily for pot culture, and was pleased to observe Mr. Young's communication on the subject. When this variety is grown in pots and forced into flower early in the season and kept for a time indoors, afterwards carefully treated, it will commence throwing up again in autumn, and frequently

flower about Christmas if kept in a growing temperature. Those desirous of cultivating this Lily to flower early should obtain bulbs and pot them directly they arrive in this country, which is generally about the middle of July. This season they were offered me about a fortnight ago. When the bulbs are to be lifted from outside borders it should be done about a fortnight after they cease flowering, for directly this Lily has done flowering it commences to grow, and therefore the sooner lifting is done the better. It is unnecessary to plant them out after retaining them for two years in pots. I have the same bulbs in pots now for flowering next year that have flowered for the past seven years. They have never been out of their pots except when repotting them. The plants alluded to have done quite as well this year as they did the first or second they were placed in pots, many of the flower stems attaining a height of from 5 to 6 feet, some of them carrying as many as sixteen flowers.

Many persons have no idea of the large number of flowers this grand old Lily is capable of bearing upon one stem. I have to be seen by any one at the present time flower stems over 6 feet high with twenty-seven flowers and buds upon them, all of which will open. These bulbs (imported ones) were planted in light sandy well-manured soil in August, 1883, and bore one spike of flowers each the following season. They have this year thrown up from two to four spikes, the majority having three. On one just counted there will be seventy-one flowers—twenty-seven on the strongest, twenty-four on another, and twenty on the weakest of the three, some others probably having more flowers on their four spikes. I have several hundred bulbs, and I think not one has failed. This I consider the most valuable Lily in cultivation for grouping in masses or for mixing in herbaceous or shrubby borders, to say nothing of its value for cultivation in pots. I have never known it fail, whether planted in light or heavy soil. It thrives here admirably, and equally well in the heavy wet land of the Lincolnshire fens, as well as in various other parts of the country in which it has been my lot to practise from time to time.—WM. BARDNEY.

DOCTORING PLANTS—AMMONIA.

IN cold bleak spring weather, such as characterised the present year, many crops—e.g., French Beans, come up yellow, weak, and miserable. It is usual to root them up and re-sow. I prefer another course. I wait until the weather becomes warm and settled and then give them a dose of the "doctor," which is prepared as follows. Take 1 lb. of the strongest spirits of ammonia, price 9d., and mix it in a quart bottle with a pint of rain water. To eight gallons of ordinary water add two fluid ounces of the solution of ammonia, and then well water the plants with this weak solution. The result is surprising. Two waterings will restore the plants to an exuberant vigour with dark emerald leathery foliage.—W. M.

At a meeting of the ROYAL HORTICULTURAL SOCIETY, held last Tuesday, E. G. Loder, Esq., in the chair, the following candidates were unanimously elected Fellows—viz., Richard Cane, Henry Ellis, John S. Mather. In addition to the above the following were elected Foreign and Corresponding Members—viz., H.M. the King of the Hellenes, K.G.; His Majesty the King of the Belgians, K.G.; H.S.H. the Duke of Saxe-Coburg Gotha, K.G.; H.S.H. the Grand Duke Nicholas of Russia; Rev. M. J. Berkeley, F.R.S.; Edmond Boissier, Alphonse de Candolle, Professor Asa Gray, Lieut.-Gen. II. E. de Greig, Sir J. D. Hooker, K.C.S.I., C.B., F.R.S.; George King, M.B., F.L.S., Sir Ferdinand von Mueller, K.C.M.G.; Charles Naudin, Sc.D.; Professor J. E. Planchon, Dr. E. de Regel, Professor H. G. Reichenbach, Dr. Richard Schomburgk, Lewis A. Bernays, Professor Maxime Cornu, Casimir de Candolle, Count Oswald de Kerchove de Denterghem, A. De la Devansaye, Professor Du Breuil, Dr. A. W. Eichler, O. Fenzl, Count Francis von Hohenstein, Fr. de Caninaert d'Hamale, Dr. A. J. Keiner, Professor Peter Macowan, B.A.; Max Leichtlin, Charles Moore, F.L.S.; Dr. Edouard Morren, Baron Edward Oppenheim, Professor C. S. Sargent, Henry L. de Vilmorin, Sereno Watson, H. Wendland.

— SUTTON'S EARLY SNOWBALL TURNIP is recommended to us by "Navet," who says "it is the finest type of the much-valued Snowball I have had in my garden. It is perfect in form, grows to a large size before becoming hot, and is most delicate in flesh and fine in flavour. For exhibition or in the kitchen it would be difficult to name a better."

— WE may remind our readers that an important HORTICULTURAL EXHIBITION will be held in ANTWERP, August 2nd to 6th, in conjunction with the HORTICULTURAL AND BOTANICAL CONGRESS from the 1st to the

10th of August, which will undoubtedly attract numerous visitors from England. No less than 132 classes are provided, the prizes consisting of two medals in each, gold, silver-gilt, and silver according to the importance of the exhibits. The classes are grouped as follows:—New plants, introductions or seedlings, eleven classes, the principal prize being a gold medal offered by the King of the Belgians for a collection of twenty-five plants introduced to Belgium since 1882; plants remarkable for their culture or flowers, nine classes; general collections of flowering or foliage plants, eleven classes. Special collections, which will form the bulk of the Exhibition, have classes devoted to Ferns, Cycads, and Conifers, Palms, Aroids, Marantaceae and Liliaceous plants, Bromeliaceous plants, Orchids, carnivorous plants, Euphorbias, Protias, Aralias, Begonias, and many others. Classes are also provided for baskets of flowers, bouquets, garlands, and table decorations. At the Congress a variety of subjects will be discussed, and an excellent plan has been adopted of printing and distributing the principal papers to be read, so as to give those who intend taking part in the discussion an opportunity of considering the subjects. Many horticulturists will no doubt avail themselves of this opportunity to visit Belgium, and the new day service of the Great Eastern Company, *via* Harwich, on Wednesday and Saturday, will be welcomed by numbers of those who do not enjoy night travelling.

— A CORRESPONDENT writes:—"Those who require CABBAGE OF MEDIUM SIZE EARLY IN THE SPRING should sow at once Ellam's Early Dwarf, for it is undoubtedly the best of all small early varieties either for spring or autumn. Ever since it was sent out I have been testing it by the side of two or three other varieties each season, and in every instance it has turned in first, while scarcely one has run in a large batch. It is a grand Cabbage, and those requiring moderate-sized, firm compact heads early or all the season will not be disappointed with it. It only needs to be planted 1 foot apart each way.

— A LARGE exhibitor of plants states that the CROTONS in Messrs. R. P. Ker & Sons' Nursery, Aigburth, Liverpool, are now really magnificent. The secret of their success with these plants is striking large strong healthy cuttings and then growing them rapidly. The plants being young are very luxuriant, consequently they develop wonderfully large bold foliage. The house in which the plants are grown is admirably suited for them. It is a long narrow rather flat-roofed structure, and the plants are arranged down the centre close to the glass and exposed to full light, which is essential to colour them so perfectly as Mr. Ranger succeeds in doing.

— MR. T. W. SANDERS, The Gardens, The Firs, Lee, writes:—"Herewith I send you blooms of a very useful sweet-scented annual—the Sweet Sultan. I have sent three varieties, which, in my opinion, rank among the most useful and most beautiful of annuals for affording a supply of cut flowers. It is a pity such charming flowers should not be more generally grown." The flowers sent are both fragrant and attractive, and will last as long in a cut state as any other annual, and much larger than the majority.

— AMONG the NEW FUCHSIAS in the collection of Messrs. Veitch and Sons at Chelsea are two that appear highly promising for decorative purposes—namely, General Roberts and Edith Todman. The latter is a light variety—that is, having a white tube and sepals, and half-reflexed cerise-coloured corolla of great substance. The plant, a free yet sturdy grower and profuse bloomer, in these respects resembling the favourite market Fuchsia, Lady Heytesbury, and will be acceptable for various decorative purposes. General Roberts is a dark Fuchsia, remarkable for its freedom of growth and long racemes of pendent flowers. It may be quickly grown into a large specimen, while for pillars or roofs it has no superior and few equals. The corolla, pistil, and peduncle are of unusual length, these together, in a flower before us, measuring 9 inches. The tube and sepals are scarlet, and the corolla a reddish plum colour. It is very graceful and effective.

— IN the same nursery is an imposing display of LILIUM AURATUM, hundreds of plants flowering with great freedom in 4½ and 5-inch pots; but more particularly striking are wonderfully strong examples of the varieties virginale and platyphyllum. These bear some resemblance to the type, yet are quite dissimilar both in foliage and flowers—one, virginale, having pure white segments of great substance, with a bright golden bar, and is very beautiful; the other has dark broken lines on a white ground, not spots like L. auratum, and the character of the plants is distinct. They are strong growers, and fine both for conservatory and garden decoration.

— **RESPECTING EARTHING UP CELERY**, "An Old Grower" recommends that unless it is required very early in the autumn, earthing up should be deferred until it is almost full grown. It is then cleaner and firmer than when earth is put to it from the first and at different times throughout its growth. From three to four weeks is sufficient to blanch it, and his December Celery is not earthed up until early in November. Worms are not plentiful then, and they rarely injure it, while loss from damp is trifling, as the stems are so hardy before the soil is put against them.

— **"A KITCHEN GARDENER"** says that his best SUMMER CABBAGE LETTUCES this season are Veitch's Perfect Gem and Webbs' Summerhill. The former is close-growing, very compact, dark green, and good in flavour; the latter, the largest of all, remarkably tender and deliciously crisp. Those who grow these two fine Lettuces from April until October will never be without material for first-rate salads.

— **WATERING WINTER-FLOWERING PLANTS**.—Owing to the incessant demand for water at the roots of rows of Peas, Beans, Califlowers, Lettuce, and Celery plants, pot Strawberries, &c., consequent upon the long spell of tropical heat, winter-flowering plants which had been planted out in a suitable situation and soil early in June are likely to get overlooked in the matter of applying water to their roots. Where this has been the case no time should be lost in giving them all a good soaking. Plants of the Calla (*Richardia aethiopica*), which is a particularly moisture-loving plant, are more likely to suffer from an insufficiency of water at the roots than are any of the other plants which are subject to the same treatment as they are. Therefore, in the absence of rain the plants should have frequent and liberal supplies of water to encourage growth, which is unusually backward in these plants this year.

— **AN AMERICAN HAILSTORM**.—A despatch from Poughkeepsie, New York, dated 6th inst., says:—At Chatham, Columbia County, hailstones fell last night measuring from 1 to 4 inches in diameter. People were knocked down and severely wounded; horses ran away in fright; dogs went yelping up the street bleeding from cuts; tin roofs were perforated; corn was cut away entirely, leaving only the stalks standing, and robins, sparrows, and other birds were found either dead at the foot of trees or with broken wings or legs. The storm was apparently about four miles in width, and did not last over ten minutes. Hardly any wind accompanied it, and but little thunder and lightning.

— **STEPHANOTIS FLORIBUNDA**.—Two plants of this popular stove climber, popular by reason of the chastity and sweetness of its pure white flowers, which are growing in 14-inch pots, resting on two hot water pipes, as they have for years past, in the central pit of a small stove not far from where we write, yield annually a profusion of large trusses of finely developed flowers. The shoots, which at the present time are showing trusses of flowers from the axil of every leaf to the tips of the young growths, are trained to a trellis fixed underneath the roof, and over the sides of which well-flowered shoots depend gracefully and effectively when contrasted with a variety of other flowering plants—Ferns and Palms, with which they intermix. These plants were somewhat reduced at the roots last spring prior to potting them in well-drained pots in a mixture of two parts peat and one of loam, with sufficient sharp sand added to keep the whole open, and after the roots had pushed well into the new soil they had a surface dressing of Beson's manure once or twice a week, the virtues of which repeated waterings wash down to the roots with considerable advantage to the plants.

— IN the same house is a well-flowered plant of **ALLAMANDA HENDERSONI** growing in a 10-inch pot, the shoots being trained up to a trellis underneath a portion of the back part of the roof. The large handsome trumpet-shaped flowers, of a beautiful soft yellow in colour, of this easily managed and very showy stove climber, command nearly, if not quite, as much admiration from lady visitors as the more chaste and sweetly scented *Stephanotis* does. The treatment accorded to the latter, as regards potting and watering, is found equally suitable for the *Allamanda*, as well as for a similarly grown plant of *Clerodendron Balfourianum* at the other end of the house.

— **NATIONAL PEAR CONFERENCE, 1885**.—The crop of Pears this present season being generally abundant and good, an extremely favourable opportunity is presented for the examination of the numerous varieties cultivated throughout the country. The Council of the Royal Horticultural Society has therefore decided to hold a conference on Pears (of a similar character to that so successfully adopted in regard to Apples

in 1883), in the great conservatory at Chiswick, commencing on the 21st October next. This conference will not assume the form of an ordinary exhibition—there will be no competition and no prizes—the objects being the dissemination of useful knowledge on the varieties most suitable for cultivation, to compare their merits and to correct their nomenclature, and generally to render the meeting instructive to fruit-growers. The collection of Pears grown in the Gardens, which contains many typical varieties, will be available for comparison. Growers of fruit will have in this Exhibition an opportunity of correcting or verifying the nomenclature of their own fruits, by bringing specimens with them and making a personal examination. Every possible assistance will be given by members of the Committee to such inquirers. All fruit-growers are invited to contribute, and the more widely the collections are procured the greater will be the interest created. No limit will be placed on the number of varieties anyone may see fit to send, and it is not necessary that they should be the products of his own grounds. The Council desires that an effort be made to procure representatives of all the varieties that are grown in the various districts, and that all should be distinctly labelled with the name or names under which they may be grown in their respective localities. It is very desirable that every collection should be accompanied with as much information as can be furnished with regard to soil, stocks, exposure, and physical conditions of the districts from which they are gathered, &c., to aid the Committee, if necessary, in drawing up their report. Cards and forms for this purpose will be supplied by the Secretary to all exhibitors on application. The specimens being strictly for examination, they must necessarily be at the disposal of the Committee where required. As the early varieties of Pears will be over before the time fixed for the conference, it is desirable that specimens of these be sent to any of the meetings of the Fruit Committee preceding the conference. These should be addressed to the Secretary, Fruit Committee, Royal Horticultural Society, South Kensington. Exhibitors are requested to send not less than two or more than six fruits of a kind for the purposes of comparison. Notice of intention to exhibit must be given to the Secretary, Mr. Barron, not later than Wednesday, the 14th October, stating the number of varieties to be exhibited and the amount of space that will be required. Consignments of fruit—to be staged by the Committee—should be addressed to the Secretary for delivery on or before Monday, the 19th October. The carriage will be paid by the Society. Heavy packages to be sent per goods train. Exhibitors staging their own fruit may do so on Tuesday, the 20th, or on the morning of the 21st, so as to be ready for the inspection of the Committee at 1 P.M., when the Exhibition will be opened. All exhibitors will be admitted to the Gardens free, and will receive tickets in proportion to the extent of their exhibits for the admission of friends.

GRAPES CRACKING.

It appears by "A Thinker's" last letter that he is highly pleased with the progress he has made in converting his opponents in this discussion to his own view of the manner in which he thinks endosmotic action takes place in Grapes, causing some varieties to crack. He makes it appear that in my first letters on this subject I totally denied the existence of the principle of endosmose. He is entirely mistaken. What I have all along said, and still maintain, is that vapour does not pass through the skins of Grapes and in this way cause them to crack.

"A Thinker" argued that because the Grapes shown at Manchester by Mr. McIndoe cracked in the tent there, being separate from the Vine, the excessive moisture which caused them to burst must necessarily have found its way into the berries through the skins, as it could not be supplied by the Vine then so many miles away. To illustrate that vapour might find another channel to get into the berries, I pointed out that cut flowers and vegetables after separation from the roots drew their supply of moisture through the cut stem, but I did not for a moment think that this could be construed to imply a denial of the action of endosmose through the leaves and petals of flowers and vegetables.

I believe also in endosmotic action in all kinds of fruits, but in quite a different way from that upheld by "A Thinker." It acts through the roots and stems, and even when the former are absent it takes place through the stem alone for a time when circumstances are favourable. But to excite this action to a strength sufficient to burst the berries of thin-skinned varieties of Grapes or Cherries either, the temperature must be high, accompanied with sufficient moisture.

To my mind, if the skins of Grapes were porous and favourable to the actions of endosmose and exosmose, Mr. McIndoe's Grapes at Manchester would have cracked on the second or third day of the Show, as it rained on these days, and, consequently, the atmosphere would be loaded with moisture; but, instead of that, it apparently took place on the fourth and sunny day. Would vegetables and flowers which freely admitted the action of endosmose direct through their leaves and petals not have been most charged with moisture on the wet and sunless days, while on the hot day

they would show signs of suffering for want of moisture? On the contrary, the Grapes, which I maintain are not possessed of porous skins, got charged through the stem to such a degree on the hot and sunny day that the skins burst. Does this show a similar endosmotic action in both cases? The degree of temperature may not be of much importance in cases where endosmose acts direct through animal or vegetable membranes, so long as the denser and thinner fluids are present; but where it acts (as I believe it does) differently, as in the case of fruits, a high degree of temperature is indispensable; but if it be not as I take it to be, but simply a question of the quantity of moisture acting on the skins of fruit, as "A Thinker" maintains, why were the Frontignans mentioned by him in his last letter placed in a damp box and kept close in a warm house to cause them to split? "A Thinker" says that Mr. McIndoe's Grapes at home on the Vines had ten times more moisture supplied by the roots, and remained sound. It would be interesting to know how he has arrived at this conclusion. How has he found out the quantity of moisture supplied by the roots to these Grapes? I have no doubt that if the Grapes at home had been treated with the same atmospheric conditions the result would most likely have been the same in both cases, as those at home would have imbibed through the roots what the others had done through the stem.

I gather by "A Thinker's" letter that he is under the impression that he has brought to light a principle of whose existence gardeners had been quite unaware. He is, in my opinion, mistaken; it is his application of this long-known principle that is denied by—HUGH HENDERSON.

SOME ROSE SHOW NOTES.

CRYSTAL PALACE.—Of the chief Rose shows at which it was my good fortune to be present, the Crystal Palace, to my mind, was by far the best as regards the quality of the blooms, which were for the most part well built and of good colour; moreover, they stood well. Whether this Exhibition happens to be an early or late fixture, it generally carries off the palm as the best, not perhaps as to quantity but quality. There was a fair show of Teas, but, on the whole, not, I think, equal to the Teas staged here last year.

NATIONAL, SOUTH KENSINGTON.—This was, of course, numerically the largest show, but the heat of the place severely tried the blooms. Exhibitors set up Roses with good plump centres, and half an hour before the judging many of them were wide awake, gazing at you with their yellow eyes, and I for one don't like to be looked at by a Rose. Few fully developed flowers could stand the heat of the conservatory, small young blooms being the safest to stage. Besides, I saw several boxes awaiting the Judges with the sun shining full upon them. In my opinion, but it is not worth much, the conservatory of the R.H.S. is not sufficiently large, cool, or shaded for the great exhibition of the National Rose Society. But for the heat and its effect, the Show was one of the best the Society has held. I was glad to welcome the presence of "Her Majesty" once again, with "Mrs. Laing" in attendance. Is it treason to say of the two, I prefer the latter? Mr. Bennett is to be congratulated.

BEDFORD.—Of provincial shows there were two that struck me as being most successful—viz., Bedford and Norwich. Of the former, since it has been noticed in your columns, I will only say how much I agree with the remarks of your reporter, and, judging from the competition that took place, thanks to the ladies of Bedford, amongst eight or nine well-known growers for sale, and that amateurs were attracted from Brighton and Bath, if the Committee will adhere to the present date, and enlarge their schedule as suggested, I think that next year we may expect to see at Bedford a first-class Rose show. Mr. Burrell had the finest Tea I have seen this season, Boule d'Or. Why was there no medal for it?

NORWICH.—No report has as yet appeared in your pages of the Norwich Show, which Society is affiliated with the National Rose Society. It deserves a better one than I can give it, writing, not from notes, but from memory. The Exhibition was held in the Bishop's garden, not in a field, but on the lawn, and very charming it was with the tents arranged under the trees and in close proximity to the walls of the fine cathedral. The order was good, and the judging true to time. The trade was not so strongly represented as at Bedford, but the amateurs made up for it, for in this section there were staged eight stands of thirty-six, ten of twenty-four, four of twelve trebles, twelve of twelve of one sort, and a very fine exhibition of Teas, just what one would expect from such a Tea-growing county as Norfolk. If the ladies of Norwich would follow the lead given them by their sisters of Bedford, the eastern counties would possess a first-rate Rose Society. Poor Caroline Kuster to be jilted so cruelly!—JOHN HOPPER.

STAMFORD HORTICULTURAL SOCIETY.

The second annual Show of this revived Society was held on the 21st inst. under much more favourable circumstances than last year's exhibition. The day opened dull and hazy, but with a rising barometer, and eventually the sun appeared and brought a good attendance of visitors, which was doubtless considerably augmented owing to the kind appeal of the Mayor to the tradesmen of the town to support the Show by closing their shops earlier than usual.

In the class open to all England the competition was very good considering the amount offered in prizes, the funds unfortunately not permitting a very long prize list. The chief prize offered was for a group of plants arranged for effect, and was secured by Mr. Wilson, gardener to the Earl of Lindsey, for a fair group of miscellaneous plants, the second prize going to

Messrs. W. & F. Brown for a very close stiff clump of plants with a fine spike of *Yucca gloriosa* in the centre. The compact nature of this group would have disqualified it at a larger show. Mr. Winn, gardener to J. R. Lowe, Esq., was placed third. Another group was arranged by Mr. Divers, gardener to J. T. Hopwood, Esq., much lighter and more natural in appearance, but deficient in flowering plants. For six stove and greenhouse Ferns Mr. Divers was awarded first prize, Mr. Winn second. The prizes for Coleus only brought two competitors—Mr. Wilson first, Mr. Winn second, the plants of the latter being the better for health and colour, although rather flat in shape. Pelargoniums, Fuchsias, and table plants were represented by neat specimens. The show of Roses was remarkably good considering the dry weather lately in this locality. Mr. House of Peterborough was awarded first for thirty-six trusses, and was the only exhibitor of that quantity. For twenty-four trusses Messrs. W. & J. Brown of Stamford were first, Mr. Wilson second. Cut flowers of stove and hardy border plants were much better shown than last year, the latter class containing some very good things. The prizes in most instances fell to Messrs. Brown and Mr. Wilson. Messrs. Brown were also deservedly placed first in five different classes for arrangement of cut flowers—viz., buttonhole bouquets, ladies' sprays, bride's bouquet, hand bouquet, and vase of flowers for dinner table; their exhibits displayed great taste and lightness of arrangement, and were very much admired. Mr. Divers was second for buttonholes, Mr. Gilbert for brides' and hand bouquets, and D. J. Evans, Esq., for vase for table.

The principal prize offered for fruit was for a collection of eight varieties, and was awarded to Mr. Divers, who showed a good Charlotte Rothschild Pine, Black Hamburg Grapes, Early Albert Peaches, Elrue Nectarines, Early Rivers and Governor Wood Cherries, Sir J. Paxton Strawberries, and Lord Suffield Apples: this was the only collection shown. For Grapes Mr. R. Gilbert was as usual a capital first, having three fine bunches of Black Hamburg and three of Muscat of Alexandria. The same exhibitor also took first honours for six Peaches; second Mr. Divers. For six Nectarines Mr. Wilson was first with Lord Napier; Mr. Divers second with Early Newington. Melons were poor in flavour and very scarce, only one green and scarlet flesh being shown.

In Strawberries the competition was very small. Mr. Wilson took first prize for four dishes; Mr. Divers second; and for a single dish Mr. Wilson was again first with Dr. Hogg; Mr. Gilbert second with Oxonian; Mr. Divers third, also with Oxonian.

As usual the premier prize for a collection of ten varieties of vegetables fell to Mr. R. Gilbert, the fresh healthy appearance of his collection showing forcibly the advantage of a deep and good soil in a dry season. Particularly noticeable were his White Elephant Onions, which would have been very difficult to beat anywhere, one of them measuring 17 inches in circumference. He also showed Radstock Beauty Potatoes; Globe Artichokes, very good; Mushrooms, Canadian Wonder Beans, Intermediate Carrots, Utrecht Market Cauliflowers, very solid and good; Telegraph Peas, Tomatoes, &c. Mr. Winn was placed second, showing good Onions and Turnips. Mr. Divers third, having good Celery, Onions, Mushrooms, &c. For twelve Tomatoes Mr. Divers was easily first with good specimens of Hathaway's Excelsior. Mr. Winn second. For one dish of Peas Mr. Divers was first with President Garfield, Mr. R. Gilbert second; and for four dishes the same exhibitors were *vice versa*.

In Class B, for persons not employing more than one gardener, the four Ferns shown by Mr. Pridmore, gardener to Miss Thompson, Stamford, deserve especial mention for their fresh and healthy appearance, also the Roses shown by Mr. Duncomb and Mr. Canner.

The cottagers were very good in the vegetable classes, especially Tripoli Onions and Potatoes, the former being so good that the eleven collections shown were all awarded a prize each. The Grasses and wild flowers were very good also in this tent. Some good honey, &c., was shown, and a fine plant of *Disa grandiflora* grown by D. J. Evans, Esq., not for competition. Mr. Redshaw of Bourn also exhibited a good collection of rustic garden furniture very tastefully made.

ORCHIDS IN VINERIES.

The best and most general combination of Orchid plants and Grape Vines I have yet seen are under Mr. Hill's care in the garden of H. Little, Esq., Hillingdon Place, Uxbridge. The vineries are of the usual lean-to type, with the Vines planted in front, and the rods and branches trained overhead. There is a shelf all round the front, and a stage in the centre, going up step by step on the same incline as the roof. It is these shelves which are filled as full as they can be with Orchids.

The front shelves contained about 200 plants of *Cattleya Trianae*, some of them being grand masses 4 feet through, and showing eighteen and twenty young growths. They were exceedingly healthy, and fibrous peat and sphagnum moss was their rooting mixture. *Dendrobium Dearei* was in full flower on the back stage. It was bearing nineteen spikes of its handsome white flowers, there being from twelve to fifteen blossoms on each spike, and it was a very beautiful object. Some plants of *Dendrobium Falconeri* were 4 feet through and exceedingly healthy.

A plant of *D. Devonianum* had produced 400 blooms, and had some dozens of healthy growths. *D. Dalhousianum* had produced seventeen spikes. This was a fine plant. Closely packed together on one part of the stage there were 150 plants of *Lycaste Skinneri*. They had capital fresh well-developed pseudo-bulbs, and many young growths. I counted the old flowering spikes attached to one growth, and they numbered ten. These were all open at one time early in the summer. *Cypripedium barbatum* superbum at one end of the vinery was bearing twenty-three blooms, some of them 4 inches across. *C. Lawrenceanum* had eighteen spikes of fine blooms; one twin purse was curious on this plant. *Masdevallias* were very luxuriant. *Laelia purpurata* was flowering freely, one plant in a basket 3 feet square was a superb specimen. A plant of *Cattleya Skinneri* had thirty leading growths. There were other kinds not specified here doing equally well, and Mr. Hill is to be complimented on the excellent success he has secured with the Orchids in vineries.

The majority of the plants remain there all the year round, and prove

very conclusively how much may be accomplished with them under conditions of the same kind when their cultivation is guided with skill and energy. "What about the Grapes?" Well, they were in good health, with plenty of clean foliage, and bearing an average crop. Many of your readers will be familiar with Mr. Little's productions in the way of Cyclamens, Pelargoniums, &c., which figure so conspicuously at the London spring shows; and if I was an Orchid competitor I would feel rather uneasy with the idea of what is likely soon to be seen from Hillingdon. Other Orchids merit notice, but as they were not under the Vines my notes on them are held over.—M. M.

NOTES FROM HANDSWORTH.

GOING through the glass department of the famed Handsworth nurseries we cannot help admiring the healthy character of the general stock, and of the hybrid greenhouse Rhododendrons in particular. House after house is filled with magnificent plants of all the newer varieties now in commerce, and scores of fine specimens are placed out of doors in nursery quarters, and protected from inclement weather by screens of tiffany. Handsworth is also famous for Lapagerias, which are there propagated in thousands annually, and hundreds of plants in 12-inch pots and trained up strings to a height of 10 feet, strong and vigorous, are to be seen out of doors and on the north side of a high hedge. These are sure to make rapid progress when planted out in their permanent positions. In passing from one house we saw two large tubs filled with water, and containing vigorous young plants of the common, but chaste and beautiful, white Water Lily (*Nymphaea alba*), which is within the reach of everyone; the roots are in 6-inch pots, and consequently can be removed without injury.

Amongst the beautiful Orchids in flower was particularly noticeable a fine plant of *Brassavola Digbyana*, bearing a large flower with very pale green sepals and petals, and a large lip most beautifully fringed, and rich creamy white in colour—altogether a very striking flower. *Phalaenopsis* are well grown at Handsworth, and produce leaves of great length, breadth, and substance. In the same house are some good plants of the charming *Bertolonia Van Houttei*, a plant worthy of more general cultivation, and close by are some good plants of the noble-looking *Sphacelocoryne latifolia*—a fitting companion for the rightly named *Cyanophyllum magnificum*. In an adjoining house are some good plants of the exceedingly beautiful *Dracæna Lindenii*, a variety that should be in every garden where *Dracænas* are grown. In one of the large cases devoted to Filmy Ferns are some splendid examples of *Todea superba* and *T. pellucida*, *Hymenophyllum demissum*, and *Trichomanes radicans*. *Camellias* are there in thousands, healthy, clean, and luxuriant; and *Azaleas*, *Roses* in pots, *Pelargoniums*, and miscellaneous Orchids are all that could be desired, and indicate the ability and indefatigableness of Mr. Williams, the foreman and manager of the glass department.—J. U. S.

NEWCASTLE AND DURHAM INCORPORATED HORTICULTURAL AND BOTANICAL SOCIETY.

THE summer Show of the Society was held on Wednesday, Thursday, and Friday last in Leazes Park, Newcastle. The park was originated by Mr. Alderman Charles Hammond, now chairman of the Parks' Committee, and is in close proximity to the business centre of the west end. Till within thirteen or fourteen years ago Newcastle was without any parks except the town moor. Now it embraces four parks, all in excellent condition, and of easy access from every part of the town. The Committee of the Flower Show are therefore favoured with a suitable *locale* for their exhibition. The staging committee (Messrs. Balfour and E. Wilson), the tent committee (Messrs. Dunning, Gascoigne, and Nesbit) were indefatigable in doing everything that thoughtful care could suggest in bringing the Show to a successful issue.

Referring to the exhibitions the grouped plants were excellent. The eight and six stove and greenhouse plants were certainly such as had never been surpassed or equalled in a previous exhibition, while the entries in all classes were numerous. For eight plants in bloom Mr. H. Johnson, gardener to J. B. Hodgson, Esq., Elmridge, Darlington, was first. The *Ixoras Williamsii* and *Dixiana* were both fine plants, large in truss, and firm. *Allamanda Wardleyana*, *Clerodendron Balfourianum*, *Ericas æmula*, *retorta*, and *Turnbull's Shannoni* were excellent and told well. A fine plant of *Statice profusa* completed the eight. Mr. J. Cypher, Cheltenham, was second with good *Ixoras regina* and *amabilis*, *Bougainvillea glabra*, *Phenocoma prolifera*, and the charming *Erica Parmenteriana rosea*. For the eight foliage plants the Society offered £26. For eight foliage plants Mr. J. Hammond, gardener to Sir Wilfrid Lawson, Bart, Brayton Hall, was first. In this stand were four *Crotons*, averaging 6 or 7 feet high. Mr. Hammond evidently makes a speciality of *Crotons*, and is a successful grower. The names were inter-ruptus aurea (with its striking characters well brought out), *majesticus*, and *Queen Victoria*. There were, in addition, *Kentia Fosteriana*, *Dicksonia antarctica*, *Dasylirocn glaucum*, and *Phoenix reclinata*. Mr. A. Methven, gardener to E. Lange, Esq., Heathfield House, Low Fell, Gateshead, was second. His plants were *Cycas revoluta*, *Crotons pictus* and *Victoria*, *Encephalartos natalense*, and *Kentia Fosteriana*. Mr. J. Cypher was third. For three *Crotons* Mr. J. McIntyre, gardener to Mrs. Gurney Pease, Woodside, Darlington, was first with *Warreana*, *Queen Victoria*, and *majesticus*. Mr. J. Hammond was second with *Morti*, a seedling, and *Hammondi*. The latter is Mr. Hammond's own raising. It is in the way of *majesticus*, but shorter in the leaf, good in colour, and excellent in habit.

The group of miscellaneous plants 20 feet by 10 feet was certainly the admiration of every critic. Mr. Hammond well won the chief position. In the background were tall Palms relieved by three finely coloured *Crotons*, all healthy, and contrasting effectively with some *Dracænas*. The ground-work was composed of *Adiantums*, from which were springing *Acalyphas*,

Hydrangeas, *Eulalia japonica*, and various flowering plants, including *Oncidium sphacelatum*, and *Odontoglossum Alexandræ*. This group was edged with *Panicum variegatum*. Mr. J. McIntyre was second with a creditable group. White Lilies, *Acalyphas*, *Dracæna Goldieana*, *Kalosanthes coccinea*, with its agreeable perfume, were used effectively.

For six exotic Ferns Mr. H. Johnson was successful in securing the first place with fine examples of *Adiantum farleyense*, *Gleichenias rupestris* and *Mendelli*, *Davallia Mooreana*, and *Microlepia hirta cristata*. Mr. J. Hammond was second, his best plants being *Gleichenia rupestris*, *Davallia Mooreana*, and *Platyserium alaicorne*. Mr. J. Noble was third. For four *Ericas* Mr. J. Cypher was first; also for six Orchids. For twelve bedding plants Mr. A. Methven was first with plants in excellent condition. Alpine plants, *Sempervivums*, and *Sedums* in a collection of twelve plants were also shown; Mr. Richardson was first in each class, followed by Mr. J. McIntyre. For tuberous-rooted *Begonias* and *Dracænas* Mr. Noble and Mr. Hammond were first respectively.

CUT FLOWERS and TABLE DECORATIONS.—These were as usual much admired. *Roses* in the north are very good this year. Although Mr. Whitwell was second to Messrs. Harkness in both forty-eights and thirtysixes it was very close, and must have caused the Judges to weigh carefully to find the best stands. Messrs. Harkness's best flowers were Duke of Edinburgh (good), Alfred Colomb, Abel Carrière, Constantin Tretiakoff, Exposition de Brie. Mr. E. R. Whitwell's consisted of Madame Lacharme, Madame Lambard, Innocente Pirola, Marie Baumann, Sultan of Zanzibar. Messrs. Mack & Son were third for forty-eight. Mr. William Boston was first for twelve yellow *Roses*, and for any colour Messrs. Cranston were first with Alfred Colomb. The number of *Roses* exhibited was over 1300. Although there are not many classes the interest in their extensive culture is evident.

Herbaceous plants are always exceptionally good at this successful Show. Mr. F. Battensby, Hagg Hill, Blaydon, was first with a beautiful stand. Second Mr. J. Short. Third Mr. J. Oliver, Easington Park. These four lots attracted much attention, as not one bad lot was shown. For twenty-four Fancy Pansies, twelve varieties, Messrs. A. Bailey & Son, Ashcroft Hall, Sunderland, were first with a fine lot. For twenty-four Show Pansies Mr. J. Bohn was first.

The first prize for a drawing-room epergne was won by Mr. J. Cypher with a chaste and beautiful combination of colour. The top tier consisted of *Pancratiums*, *Odontoglossum vexillarium*, *Cyanus major*, the blue of which was most effective. The base was also equally effective, being composed of *Dipladenias*, *Gloriosa superba* in a pendent position, and *Masdevallias*. Mr. J. Lamb, gardener to Lady M. Thompson, The Hermitage, Chester-le-Street, was second with an excellent arrangement where *Francoa ramosa*, *Water Lilies*, *Tacsonia Van Volxemi*, and *Dipladenias* were employed neatly draped with *Lygodium scandens*. This is only a young exhibitor, and it is to be hoped we shall see his work again. Mr. J. Cypher also scored first prize for the hand bouquet, which was very beautiful. It contained *Pancratiums*, white *Lapageria*, *Eucharis*, *Agapanthus umbellatus*, and *Cattleya intermedia*, every flower being seen to advantage, with *Adiantums*—neither too much nor too little. Mr. Cypher was also first for a bridal bouquet with similar white flowers as above. Mr. Atkinson followed Mr. Cypher in each class of nine competitors. For the buttonhole there were over twelve competitors. Mr. J. Douglass, 14, Durham Street, Newcastle, was first. It contained a *Tuberose*, *Hoya bella*, *Oncidium flexuosum*, and *Forget-me-nots* on a back of *Adiantum gracillimum*. Mr. Thomas Battensby was second.

In Class B nurserymen are not allowed to exhibit. For six plants the Society offered £12 and a Veitch Memorial medal. Mr. E. H. Letts, gardener to the Earl of Zetland, was first with superb examples of culture, the *Ericas Shannoni*, *obata*, and *Anthurium Schertzerianum* 6 feet through, with spathes 5 inches long, being of remarkable excellence, with *Azalea Brilliant* over 8 feet high as fresh and as brilliant as it had been April instead of July. Mr. Bartle Thompson, gardener to E. Hope, Esq., Morpeth, was second with a good *Stephanotis*, *Erica speciosa*, *Dracophyllum gracile*. Mr. E. Adams, Swallow, third. For six foliage plants Mr. E. H. Letts was first with *Cycas revoluta*, *Kentia Fosteriana*, *Crotons Johannis* and *majesticus*, and *Dasylirocn acrotrichum*. Mr. J. Hammond was second. For six Ferns Mr. H. Johnston was first and Mr. J. Noble second, both exhibiting well. For hardy Ferns and Orchids Mr. J. Noble was first, and Mr. E. H. Letts for three *Ericas*. For table plants Mr. McIntyre was first. *Coleuses* and *Fuchsias* were also shown.

CUT FLOWERS and EPERGNE.—For twenty-four *Roses* the Society offered £6 and the Knightian medal. Mr. G. Finlay was first, Mr. Laws second; and for twelve *Roses* Mr. G. Finlay was likewise first. In each case he showed excellent stands. Mr. T. Smith was first for Pinks, and Mr. Flowdy first for both *Carnations* and *Picotees*. For six bunches of cut flowers Mr. J. Noble was first and Mr. H. Johnston was second. For a drawing-room epergne Mr. T. Rutherford, Layes House, Durham, was first with an arrangement that was faultless; Mr. T. Battensby second. For a hand bouquet Mr. T. Rutherford was also first, in which *Lælia purpurata* and *Ixora* were used with effect. For a basket of cut flowers Mr. T. Rutherford was first, and Mr. Geo. Corbett second. The bridal bouquet prize was won by Mr. J. Battensby, Swallow.

FRUIT.—Grapes were excellent, but perhaps some of them, such as *Muscats* and *Madresfield Court*, were scarcely ripe enough. For eight dishes Mr. J. Edmonds, gardener to the Duke of St. Albans, was first with a *Queen Pine* (3 lbs. weight), *Black Hamburg Grapes* (excellent), *Muscats of Alexandria*, *Elruga Nectarines*, *Chancellor Peaches*, and *May Duke Cherries*. Mr. A. Methven was second. Only two collections were staged. For four dishes, *Pines* excluded, Mr. E. Edmonds was first also. The *Grapes* were excellent, *Bellegarde Peaches* and *Best of All Melons* being good. Mr. Wm. Jenkins, Aldin Grange, Durham, was an excellent second, *Black Hamburg Grapes*, *Hales' Early Peaches*, *Hunt's Tawny Nectarine*, and *Blenheim Orange Nectarine* all being very good. Mr. R. Dawes, gardener to the Hon. Mrs. M. Ingram, Temple Newsam, Leeds, was third. There were seven competitors. For one *Pine Apple* Mr. R. Parkes, gardener to J. Corbett, Esq., Impney, Worcester, received the chief prize. For four bunches of *Grapes* Mr. F. Douglass, gardener to J. Harris, Esq., Derwent Lodge, Cumberland, was first, *Black Hamburg*, *Madresfield Court*, and *Muscats of Alexandria* being excellently staged. Mr. J. Thompson, gardener to T

Boyd, Esq., Dumfries, was second, and Mr. Methven third. The same exhibitor was also first for two white bunches with Muscat of Alexandria, which were in every respect good; and for two bunches of black Grapes Mr. J. Thompson was first with Black Hamburgh, large in berry, and finely finished. For a scarlet-fleshed Melon Mr. J. Parkes was first. Strawberries in every case were excellent, Mr. R. Dawes being first with James Veitch.

Not for competition.—Messrs. William Fell & Co., Wentworth Nurseries, Hexham, exhibited a greatly admired mixed collection of plants, consisting of *Acer Negundo variegata*, *Hedera maderiense variegata*, *Pyrethrum White Queen*, &c. Messrs. J. Rohson, nurserymen, Hexham, exhibited a similar stand to the above. He had his crested Moss Rose (*Rosa cristata nova*). Messrs. Thompson & Whittaker, South Shields, as agents for the Norwegian Fish Guano Company for the north of England, exhibited their new manure, which is called "Fish and Fish Potash Guano," and is useful for all gross-feeding plants.

The day was fine, and the receipts were never so large before. The Committee, Judges, and friends partook of luncheon, which was presided over by the Treasurer, Thomas Gray, Esq., who was supported by several influential gentlemen of the district.

EARLY PEACHES—LORD NAPIER NECTARINE.

Mr. Muir may well be pleased with Hale's Early, for it is undoubtedly very pleasing to the eye when well grown. The large size of the fruit and the high colour it attains when exposed fully to the sun renders it as striking as that well-known variety Bellegarde, which is generally accorded such prominence at exhibitions. Appearance goes a very long way nowadays, but the fact cannot be overlooked that Hale's Early cannot be compared to the old Royal George for flavour. The last may be considered excellent, but this cannot be said of the American, for all I have tasted have been slightly woolly. I have grown good examples of this variety and tasted very fine fruit grown by others, but in every instance the same fault was apparent, and this is the only defect known to me that this otherwise fine Peach possesses. It is well worth growing on account of its earliness where earlier kinds have not been introduced.

Early Beatrice ripens freely a fortnight before it and colours remarkably well, even the fruits on the under or shady side of the tree, but it is rather small. Where Peaches are required as early in the season as possible I consider it worth a place in a small early house, and if the tree is not cropped heavily it will produce very fair sized fruits. The fruit, however, is soft and packs badly if allowed to remain upon the trees until it is fully ripe; in fact, I am inclined to believe it improves in flavour by being gathered a few days before it is ripe.

Probably the best of all early Peaches is Alexander, an American variety, which ripens before the last named. This variety grows larger than Early Beatrice, colours well, and is very juicy, and, I should say, possesses a good flavour. But on the last point I can scarcely speak positively, for my tree has not had one of the most favourable positions, only having 9 inches depth of soil to grow in and the border not more than 1 foot wide. Its behaviour this season has determined me to give it a better position in the course of a few weeks.

Lord Napier Nectarine is really an excellent variety for an early house. It is very fruitful, colours well—that is, fully exposed fruits—ripens ten days before Royal George, and attains a larger size than any other Nectarine with which I am acquainted. In flavour it is very juicy, and superior, in my estimation, to the whole of the type of which Elruge may be taken as an example. The whole of the Pine Apple section are certainly superior in flavour, but they are totally distinct in this respect, and therefore can scarcely be placed in comparison with Lord Napier.—WM. BARDNEY.

NOTES FROM CARDIFF CASTLE.

My first and rather too brief visit to this place was fortunately early enough in the season for the early vinery to be seen at its best, and although I have inspected some of the best houses of Grapes in this country at various times, I was never before so much impressed with the general appearance of a house. Later on, the crops on the late Vines will be equally as imposing, and in both cases the perfection of culture displayed by Mr. Pettigrew, the well known gardener in charge, plainly indicates that he has largely profited by his Thomsonian training. Nearly all the houses, including the vineries, at Cardiff Castle, are commodious span-roofed structures, and as the superior value and utility of these are fast dawning on the minds of the gardening community, a future reference, with measurements, will, I venture to think, prove instructive to the readers of the *Journal of Horticulture*, and I will therefore merely allude to the crops as I saw them. The sunniest side of the early vinery is entirely occupied with Foster's Seedling, the other side being filled with Black Hamburgh, and both of these reliable sorts were carrying an extraordinarily heavy crop of very handsome bunches. Any number of show bunches might easily be cut from the first-named, while the Black Hamburghs were also very fine in every respect. In the late house a remarkably even crop of Alicante, Lady Downe's, Alnwick Seedling, and Mrs. Pince were to be seen, and many of the bunches of these again give promise of being "fit for any society."

Mr. Pettigrew has long been a believer in the extension system of growing Vines, and the results of his practice fully bear out all that has been advanced in favour of that plan. The Vines are planted on each side of the house, the stems being trained along the fronts of the house, and the fruiting rods, one to each rafter, meeting at the apex of the roof. This gives each rod a length of about 16 feet, and on one of these fruiting rods, selected at random by one of our party, there were twenty-four to twenty-seven heavy and perfectly formed bunches. There is no crowding

of growth or foliage, but every inch of space is occupied. One object for leaving such a heavy crop was to prevent grossness of growth, and in inexperienced hands this would certainly effect this only too ineffectually, but Mr. Pettigrew is confident of being able to finish the crops without unduly weakening the Vines. The borders being inside and full of roots, the most liberal treatment can be (and must be in such a case) resorted to, Thomson's manure playing an important part in the process.

Melons and Cucumbers have long been a specialty at Cardiff Castle, and these again I was fortunate in seeing at their best. A span-roof house, 72 feet long, 20 feet wide, and 15 feet high, is principally devoted to them, nearly the whole of the roof on one side being occupied with Melons, and the other with Cucumbers, a narrow pit for fruiting Pine Apples running through the centre. Mr. Pettigrew's Cardiff Castle is the only Cucumber grown, and the crop of this extremely useful sort was quite sensational, especially as there were hundreds of fruit perfecting a crop of seeds, besides innumerable others of all sizes. The fruit runs from 12 to 15 inches in length, are very even in size, perfectly straight, no neck, and the colour is good. The great demand for seeds is a proof of the fast-growing popularity of the variety, and from my own experience with it I can safely assert that it is the best all-the-year-round variety in commerce. Several varieties of Melons are grown, and nearly the whole of them were carrying heavy crops in various stages of growth. Nowhere else, perhaps, could there be seen such a length and width of roof so perfectly hung with fine Melons. The Peach house is a lean-to structure, this being about 12 feet high, 72 feet long, and 15 feet wide, four trees occupying the whole of the roof, and these perfect examples of the extension system of training had, or were, ripening off very heavy crops of fruit.

In the large plant stove the row of immense plants of *Eucharis amazonica* attracted attention, especially seeing how many cultivators have lost their stock of plants, or if they are not dead are become deplorably weak. There are no signs of the dreaded disease among the Cardiff Castle plants, neither will there be, I firmly believe, so long as the treatment is rational. Mr. Pettigrew does not indulge in the high-pressure system, nor boast of the number of times he has flowered them in a year, but he can point to a grand row of plants in 12-inch pots, and measuring from 5 feet to 6 feet through, the foliage, as may be imagined, being large, stout, and healthy. Many of them have not been repotted for eight years, and those that were recently divided first split their pots, this rendering repotting unavoidable. They are never taken into a cool house, dried off, and so-called rested, but receive abundance of liquid manure, especially at the growing periods. As a consequence of this intelligent treatment, and which also accords with that most successfully practised by Mr. Taylor when at Longleat, two heavy crops of flowers are annually produced, while a few flowers are developed at odd times, which maintains a supply nearly or quite all the year round. It is the frequent shaking-out and repotting, the restings, drying off, and restarting the plants in a violent heat in order to make them produce flowers in and out of season that gradually but surely impair the constitution of the bulb, and a collapse, attributed to disease or insect agency, is the result. There were plenty other well grown stove plants to be seen in company with the *Eucharis*, but we all happened to be well acquainted with the great value of the latter for affording cut flowers, and must confess to having nearly overlooked everything else.

An equally fine span-roofed house is devoted to greenhouse flowering plants, and here again there was much to admire. The centre bed was filled with *Fuchsias* in full bloom, such a display in fact being very rarely to be met with in a private place. The majority of them were 9 feet high, and either in 10-inch or 12-inch pots, some being pyramidal and others free-branching standards, the latter for decorating the Castle when the family is in residence. It ought to be added that they are all only twelve months old, being struck in the summer and kept growing in heat throughout the winter. Among the plants occupying the side staging of this house a batch of the handsome sweetly flowered *Lilium eximium* was very conspicuous, the noble ivory white blooms of this variety rendering it singularly effective when in mixture with other plants or blooms. Another striking and uncommon feature was the grandly flowered hatch of the lovely *Gladiolus Colvillei*, The Bride. There were about 120 pots of bulbs, each on an average carrying twelve strong spikes of nearly pure white bloom, and, as may be imagined, the effect was unique in its way. The bulbs are usually repotted when ripe or about November, good loamy soil and 7-inch pots being used. They are wintered in frames, turned out in the open in March, and brought into flower as required, those we saw being at their best late in June. It must not be thought that I have exhausted the material for furnishing notes, as at present I have only really touched upon the subject.—VISITOR.

MUSCAT OF ALEXANDRIA GRAPE.

NOTHING is more disheartening to a good gardener, whose experience and success in other branches entitle him to respect, than to fail in producing satisfactory crops of Grapes, and yet see others without any seeming trouble have them as it were at their bidding. There is nothing for it but for those who are successful to continue recording their experience for the benefit of their less fortunate brethren, for however firmly cultivators may be attached to established notions, there will occasionally crop up new observations which set them thinking as to whether some old notions may not be given up and their practice reformed. Such an idea, based upon certain facts and practice, carried on

for the last ten years with two houses of Muscat of Alexandria, has occurred to me in relation to the successful cultivation of this magnificent Grape.

The two vineries mentioned are half span, each 50 feet long, with inside and outside borders. The Vines have been planted about twenty years. Both are heated with hot water, but a flue runs along the bottom of the back wall the full length of both houses. They are situated on the top of a limestone hill some distance away from our other houses, and as we are solely dependant upon rain for our water supply, the following practice at first was followed more from necessity than choice; but that the results are satisfactory, all who see them will readily admit. The fact I wish to call attention to is the small amount of atmospheric moisture maintained, as the syringe and evaporating troughs are not used after the Vines are well started, with the exception of one good washing the bunches receive to facilitate the process of thinning. The shoots are all stopped two or three leaves beyond the bunch when they are first tied down; afterwards they are allowed to grow at their own will until the Grapes begin to ripen, when we remove a portion of the lateral growths to admit sunlight to the bunches, as I find they will not colour well in too much shade. The borders receive a good covering of half-decayed stable manure before the Vines are started, and twice through the season they are sprinkled with guano or sulphate of ammonia. We give the inside borders a good watering about once every ten days. No damping or sprinkling of paths and borders takes place between the regular waterings, as we consider such a waste of water.

I am of opinion that Muscats require more water at the roots and less moisture in the atmosphere than the majority of Grapes, and that at no season of the year should their roots be allowed to be dry. Some growers never water their Vine borders from the time the Grapes are ripe until they start again in the spring, which I think is one of the most likely causes of shanking. We should not ignore the teachings of Nature; she is a good guide, and it is well known that soil is much heavier and carries more moisture in winter than at any other season of the year, and I can see no reason why Vines should be starved and the roots shrivelled by a deficiency of water at any time. The soil may contain all necessary ingredients, but water must be present to prepare and liberate them for appropriation by the Vines.

Muscats do not require so much heat as is generally supposed, as this season, during the time the Vines were in flower, the temperature was often for hours as low as 55°, and yet with attention to the ventilation in the morning as soon as the sun touches the house, Muscats have set as freely as Black Hamburgs. In my opinion many of the ills Vines are subject to are caused by a close and moist atmosphere combined with high night temperatures, which cause the foliage to be soft and flabby, with watery badly ripened wood, which contains an excessive amount of pith.

Enclosed is a photograph of this season's crop in the earliest house. The Vines were started the first week in January. The photograph was taken by Mr. Gilbert Wilson of Grange-over-Sands on July 1st.—SAMUEL HALLMARK, gardener to E. Mucklow, Esq., Castlehead, Grange-over-Sands, North Lancashire.

[The photograph shows an excellent crop of large well-set bunches, and fully proves the success of Mr. Hallmark's method of treatment.]

BAPTISIA AUSTRALIS.

GENERALLY called False Indigo, a name derived, it is supposed, from the economical use of *B. tinctoria*, which yields a coarse indigo dye, not now extracted.

Five species, all showy garden plants, are enumerated in Dr. Gray's "Flora of North America," to which a few have been added, and most of which are in cultivation, though, unfortunately, not to that extent which their superior merit entitles them to be. They may be classed amongst hardy ornamental herbaceous plants, as they are extremely useful for shrubberies, mixed borders, and rockeries.

B. australis, represented in the accompanying illustration, is an extremely free-flowering species, perhaps the most generally known in gardens, having been cultivated as far back as 1758. For a back place on the rockery few plants are more desirable, and few give such a satisfactory return under all circumstances. In sun or in shade, in damp soil or dry, *B. australis* seldom fails to produce an abundance of indigo blue flowers, almost as large as well-grown Sweet Peas. The whole plant seldom exceeds 2 or 2½ feet in height; the stems are branched, producing the flowers in racemes often halfway down; leaflets blunt, wedge-shaped, and having stipules as long as the leafstalks. It flowers June and July.

Others may be mentioned, such as *B. tinctoria*, *B. leucophaea*, *B. alba*, *B. exaltata*, *B. versicolor*, and *B. perfoliata*. The specimens figured were grown by Mr. Ware at Tottenham.—S.

WOOLTON WOOD,

THE residence of H. Gaskell, Esq., is situated at Woolton, about six miles from Liverpool, and is easily reached by train from the central station to Hunts Cross, being only about ten minutes' walk from the latter. The mansion and gardens are approached by a drive that winds through a large wood of stately trees, composed principally of Beech, Elm, and Sycamores, with an abundant undergrowth of *Rhododendron ponticum* and hardy Ferns. The former in some instances skirt the margins of the drive and various walks that abound in the wood, while large patches of the latter give to the whole a cool, effective, yet natural appearance. Wood Hyacinths exist in quantity, and at the time of my visit large patches with Ferns and *Rhododendrons* in the background were just past their best, but displayed at a glance the effective beauty of such simple sweet flowers when mass'd together and planted in suitable positions. Earlier in the season a similar display is obtained by the old double yellow Daffodil, which has been freely established.

The mansion is a commodious and substantial structure, and in appearance it is rendered very ornamental by the mass of foliage and flowering plants that clothe the walls from the base to the roof. The climbers used for this purpose consist principally of Ivy, Virginian Creeper (*Ampelopsis hederacea*), *Wistaria sinensis*, and Roses. The well-kept lawn in front was beautifully green in spite of the dry weather; it stretches for some distance, and from it is obtained a most beautiful view. The river Mersey can be seen along its winding course in the valley below, and visible beyond as far as the eye can reach is the beautiful landscape of Cheshire. In the background stands out prominently a range of Welsh mountains, which add wonderfully to the beauty of the picture. Shrubberies flank the lawn on each side, and are freely dotted with herbaceous plants, which impart change and variety, as well as supply, if needed, useful material for cutting.

We returned to the wood by what is known as the Heather Walk, from the large clumps and patches of Heath that have years ago been freely planted, and which must be very effective during the time they are in bloom. During last year fresh objects of interest have been added to this portion of the grounds in the form of large mounds or portions of rockwork for the accommodation of alpine plants. Large provision has also been made in various parts of the garden, especially against the fernery and Orchid houses, for the cultivation of these lowly plants. Limestone has been brought from Derbyshire and mounds formed with it, while smaller portions have been freely intermixed in the soil, in which Gentians and many other species have been planted that inhabit naturally limestone hills. The provision made for these highly interesting and charming gems has been one of thought and study. The luxuriant growth of many of the plants testify that the position and home accorded them is a genial one. *Gentiana verna*, a plant very rarely seen thriving satisfactorily in gardens, is doing well there, and this is only one of many that will in a very short time fill the nooks in which they are planted. Time and space forbid me to particularise these plants further, and the same may be said of the herbaceous border that surrounds this compact and neat rock garden. The walk leads to an old quarry, which is entered by a number of rugged stone steps. Last winter beds were here formed and planted with a collection of Lilies, Irises, hardy Heaths, and a few Orchids. The sides are planted with Ivy, Heaths, Foxgloves, and many other hardy plants. Many of the Lilies and other plants have started away strongly and well, and it will be interesting to watch them in the future, for vertical light only can reach the plants, and this through the large forest trees above alluded to, which surround the quarry.

The vineries, Peach house, Cucumber and Melon houses, sundry small plant houses, and what we may term a show house or conservatory, are arranged in the kitchen garden. The fruit houses were looking very well and promised to supply good crops. The ordinary decorative flowering plants were grown in the small houses and arranged in the conservatory or show house while in bloom, which was gay with a miscellaneous collection of plants. The kitchen garden was neat and well filled with all vegetables that are required for the supply of the establishment.

The above are referred to but briefly, because the Orchid houses and the large collection they contain of well-grown plants are the main attraction of these gardens and must next receive attention. For some years Mr. Gaskell has been enthusiastic in his endeavour to form a good collection of these plants, and during the past two or three years very large numbers have been added. This is the finest collection of Orchids in the neighbourhood of Liverpool. The greater number of the plants have been obtained as they have been imported, and in addition very high prices have been paid for rare and choice varieties that are established when offered for sale. There are in all six large houses solely devoted to Orchids, and the first entered was filled with *Odontoglossums*, nearly all of which have been established within three years. The plants are strong, and they have made wonderful progress. The whole of the centre of the house was filled with plants in flower, principally *Odontoglossum crispum*, and *O. vexillarium*, some of the latter having flowers of an enormous size, while nearly every one of the former were superior varieties, the majority of them having large broad sepals and petals, some of the purest white, others beautifully spotted and shaded with rosy pink. Dark forms were abundant, and two or three were decidedly the most highly coloured varieties I have seen, one of these having nearly a round flower, while the sepals and petals were much cut and fringed exactly the same as the lip of many of fine forms of this lovely Orchid, the lip being well fringed also. This is the first time this plant has flowered; it was imported in 1882, and it will be of interest to watch whether it retains this distinct form. *O. polyanthum* and *O. pretextum* were also in flower in this house. *Oncidium crispum* was most conspicuous with two spikes of showy flowers fully 5 feet long and much branched, each branch being nearly as large as the spike generally seen on this variety. Before passing from this house some idea may be formed of the health and vigour of the plants when it is stated that the majority bearing large flower

spikes had started vigorously into growth, in several instances two growths having issued from one pseudo-bulb. Plants less healthy and luxuriant often have their growths retarded for a long time by the strain of a large spike of flowers.

A hint in relation to these plants may be turned to useful account by Orchid growers, and that is the system of spring potting has not been practised with them. Mr. W. Davies, the able gardener at Woolton Wood, believes in repotting *Odontoglossums* that need it in autumn instead of the spring. I am scarcely in a position to pass an opinion at the present time on this subject, but have watched the plants in question for some time, and their general condition leaves nothing to be desired. The plants flowering so profusely and growing so vigorously were all repotted early last autumn.

The second house in this range is devoted to *Lycastes*, *Maxillarias*,

The *Masdevallia* house is a lean-to structure with a north-eastern aspect, and is filled with large healthy plants of all the leading species in cultivation. New and rare forms are also well represented. The old flower stems indicate the wealth of beauty that these plants must have presented a short time ago. The plants in this department were somewhat spotted a few years ago, but by the admission of more light and air and a little higher temperature Mr. Davies has succeeded in growing the plants out of it, and all the new foliage for a few years past has been clean, healthy, and luxuriant. The condition of the plants is excellent, and we can form but little conception of what size and strength these plants are capable of attaining, for there they appear to grow with greater vigour and produce annually finer and harder foliage. Mr. Gaskell may well feel proud of them, for many are 18 inches or more in diameter and growing in 10 and 12-inch pots. Those who have visited the leading Orchid establishments in this country say they

Fig. 16.—*BAPTISTA AUSTRALIS*.

Zygopetalums, and *Odontoglossums*, that require a little higher temperature than the cool house. It was filled with a great variety of these plants in the most perfect health. Conspicuous in this department hung suspended from the roof two remarkably fine plants of *Masdevallia bella*, one of the two being probably the finest plant in the country. It was not one of those small insignificant pieces frequently seen, but a large plant in an 8 or 9-inch pot with a perfect ring of its curious flowers. A large plant of *M. Chimæra* was equally fine, and as well flowered as *M. bella* that hung by its side. Other plants in flower in this house were *M. radiosa* and *Mamodes Medusa*, a very rare and truly extraordinary plant, the flower having light green sepals and petals tinged with brown, while the lip is maroon in colour with green towards the base. The third house in this range comprised amongst others large well-grown masses of *Lælia anceps* and its white variety *alba*. *L. anceps Dawsoni* is also represented. *Lælia autumnalis* is largely grown, and a fine plant of the rare *L. amanda* doing well. *L. monophyllum*, a healthy little plant, which is also very rare, is throwing up its first flower spike. Several other varieties of *Lælia* exist, and grand masses of *Cattleya Gaskelliana* are growing luxuriantly.

have seen nothing to surpass this houseful of *Masdevallias*. *M. Veitch* was in flower and is one of the finest, while I noticed an exceptionally good plant of *M. Davisii* that had borne a good number of its showy yellow flowers.

The *Cattleya* house is a large span-roofed structure and crowded with large masses in pots and pans, while the roof is almost covered with a great variety of plants on blocks, rafts, and in baskets. Especially noteworthy is *Cattleya exoniensis*, a fine plant with five strong breaks, two smaller plants also doing well. The autumn-flowering *C. lachata* was making excellent growths that if well ripened will be sure to produce large finely developed flowers of great substance. The new and unique *C. Whitei* was also at home and doing well. *C. Skinneri alba* is a superb healthy plant, and it is questionable if any larger plant is to be found in any Orchid-growing establishment. *C. Dodsoni* and *C. Wagneri* were also good plants and making capital progress. Suspended from the roof just over the door was a truly magnificent plant of *C. Warneri* that had carried nine spikes of flowers, with two and three flowers on each spike. Several large plants of *C. Percivaliana* were conspicuous, and which I saw profusely flowered on a previous occasion,

but which are now growing and rooting very freely. This *Cattleya* house is also rich in *C. Trianae* and its varieties, many very large plants. The same may be said of *C. Mossiae*, *C. Mendeli*, and other well-known popular Orchids. *C. gigas* and *C. Dowiana* had been removed to what is known as the stove, where they and several other varieties are suspended from the roof to enjoy more light, which Mr. Davies has found of importance. Several plants of *Thunia Marshalli* were in full beauty, while those that had previously flowered were stood outside, after having been well prepared for the remainder of the season to ripen and mature their growths. *Lælia purpurata*, fine healthy plants, were also outside with them in a shady position. I am not aware that the last-named plants have been subjected to this treatment in previous years, but it has been discovered that a lengthened and complete season of rest is essential in retaining them in perfect health.

The East Indian house is a long span-roofed structure, and built of teak. Several plants of *Aerides Dayanum* were in flower, *Aerides expansum leoniae*, *Aerides crassifolium*, *Aerides Lohbi* were also in bloom, several plants of each as well as two or three distinct forms that had been recently imported with *Aerides crassifolium*. *Aerides affine superbum* (Manley Hall variety), a sturdy, healthy plant producing two large flower spikes. *Saccolabium guttatum Holfordianum*, two beautifully developed spikes, while the display of *S. Blumei majus* will be very fine in a short time, for the flower spikes are visible on several dozens of plants, from those growing in 6 and 7-inch pots to large masses in baskets 2 feet across. The whole of the *Aerides* and *Saccolabiums* have been imported during the past two years; they have made remarkable progress and are now well established and perfectly healthy. No attempt is made to cram the roots of these or any similar plants into the material in which they are potted, but they are allowed to throw out their roots naturally into the moist atmosphere of the house, and the admirable condition of the plants proves that they enjoy the treatment they receive. Along the middle of the house on the centre stage are some healthy *Vandas*, while a number of *Anæctochilus* occupy a close frame in one corner. The *Phalænopsis* noted in these pages a year or two ago occupy a position in this house, and are now being established on the top of long narrow Orchid pots—if they may be so termed, for minus the numerous holes they resemble drain pipes (these, I believe, are a form of the new Orchid pots supplied from the Liverpool Horticultural Company). Others very similar are made of teak, to which the roots are commencing to cling freely; the centres are filled with charcoal in lumps, very little moss or peat fibre being used. In this house a large batch of *Odontoglossum Roezlii* is doing splendidly and showing numerous spikes of their large lovely flowers. A large collection of *Cypripediums* are also making their growths in this structure. *C. Spicerianum* is represented by a score or more of plants, the largest being in about 10-inch pots; *C. barbatum nigrum*, a large painful about 4 feet through, fine plants of *C. caudatum*, *C. Parishii*, *C. Stonei*, *C. Lowii*, and many others might be named.

The *Calanthes* are grown in the stove, in which a general collection of stove-flowering and foliage plants are also grown. The number of *Calanthes* grown would of themselves fill an ordinary sized structure; they are very strong and luxuriant, most of them being grown in 8-inch pots, with about half a dozen pseudo-bulbs in each pot. This might also be considered an Orchid house from the enormous quantity of *Dendrobiums* and others that are suspended from the roof all over the house, one end being entirely filled with *Dendrobium Jamesianum* and *D. formosum giganteum* making their growth and established on blocks and in baskets. The *Coelogynes* occupy this house in which to make their growth, and many of the plants are more than 3 feet through. They are making very strong growths, especially *C. Lemoniana*, which is about the same size, and always flowers twice in the season, in the autumn from the top of the pseudo-bulbs made, and in spring from the base the same as *C. cristata*. Is this natural to this variety, or in any way due to superior cultivation? Several stove plants are worthy of mention, but I merely name the two large and well-grown plants of *Anthurium Andreanum* and a collection of fine plants of *Nepenthes* and pass to the fernery.

The fernery is close to the Orchid houses and rock garden, the interior presenting a natural and picturesque appearance. The rockwork is well and tastefully arranged with red sandstone, which in time will become naturally green and the Ferns increase freely upon it. The rocks and interior of the house is well furnished already, for *Dicksonias*, *Cyatheas*, and *Alsophilas* with stems varying from 5 to 8 feet have been freely planted, and are spreading their gigantic fronds and already filling the roof portion of the house. The dwarf-growing Ferns are thriving amazingly beneath them. Upon entering a fine plant of *Asparagus plumosus nanus* planted out and trained to a few thin wires stretched from the ground to the roof has already reached the top of the house. This is a grand plant for such a position and evidently grows luxuriantly in the temperature of the fernery. Behind this *Asparagus* and hid from view by it when entering is a small pool of water surrounded with *Todea superba*, and remarkably well they look, it is just the position for them. A small stream crosses the walk, in fact issues from the rocks and enters the pool, and here again *Todea pellucida* is doing well, and *Trichomanes radicans*. Many other filmy Ferns were at first planted out, but it has been necessary to lift them and place them in a close case in the house, where they can be kept constantly moist, the atmosphere of the fernery proving too dry for them; they are now established and growing well.

It only remains for me to say that the condition of the Orchids, considering what has been done in so short a time, and the gardens generally, reflect the greatest possible credit upon Mr. W. Davies, who is evidently a thoroughly good general gardener, for all he takes in hand does well. I wish to thank him for the courtesy he has shown to me on several occasions, and I regret to learn that he has resigned the charge he has had for the past nine years, but hope he will soon be in harness again where he will be able to display his superior knowledge and ability.—W. BARDNEY.

GRAPES IN THE NORTH.

Now that another exceptional season is getting well advanced, perhaps the following notes regarding Grape culture north of the Tweed will interest many readers of the Journal. Being privileged lately to visit a few fruit-growing establishments, it was gratifying to note the marked

improvement generally apparent this season, doubtless arising from the fine season we had last year.

NORWOOD HOUSE.

This, the residence of John Paton, Esq., is distant about one mile from the town of Alloa, and seven from the ancient town of Stirling. Beautifully situated on a rising eminence on the north bank of the river Forth, it commands a fine view of the rich tract of country watered by that river. The glass houses are not extensive, and the accommodation for Vine-growing rather limited, there being but two vineries; nevertheless, the Grapes they annually produce but proves the fact that, when in the hands of a skilful cultivator, large and separate houses for different varieties are not always necessary for the production of first-class Grapes. Here we found as many as sixteen varieties growing in one lean-to house not more than 30 feet long, and all receiving the same treatment. They include Muscat of Alexandria, Duke of Buccleuch, Buckland Sweetwater, Rasin de Calabria, Black Hamburg, Alnwick Seedling, Lady Downe's, Alicante, Gros Colman, Madresfield Court, and many others, and, what is most remarkable, scarcely any are on their own roots, but are grafted, some with as many as four and five varieties on the same rod. Although it was too early at the time of our visit to speak of their finish, still their appearance was satisfactory. The most striking Grape is undoubtedly the Duke of Buccleuch, and in few places is this noble though troublesome Grape grown to such perfection as it is at Norwood. This season it is looking as good, if not better, than is usual, large bunches with magnificent berries. What a robust grower this variety is even when grafted! The stalks of some bunches were almost as thick as one's finger, with wood and leaves of a corresponding grossness; indeed, this is a striking feature of all the Norwood Vines. Some Gros Colmans especially were very large in leaf and strong in wood, and were swelling off bunches with very large berries. Madresfield Court was also very fine in berry, and just changing colour. We noticed some rather large bunches of that highly flavoured, though insignificant-looking Grape, Duchess of Buccleuch. We were sorry we did not take note of the stocks the different varieties were grafted upon, and which seemed to be doing so well; but perhaps Mr. Kirk will kindly make good the omission at some future time. He informed us by putting in an eye in spring he can cut a bunch fit for exhibition from the same eye by autumn.

Plants are not numerous, but are extremely healthy and well grown. A plant stove contained a good collection of the best varieties of Crotons and *Dracenas* suitable for table work. A large circular conservatory adjoining the mansion was well filled with the usual greenhouse plants, well grown and flowered, and included a very fine strain of herbaceous *Calceolarias*. Out of doors everything was extremely neat and tidy, carpet bedding especially being very effective. The lawns and shrubberies were thickly studded with the finer varieties of Conifers, which, although small, were remarkable for their health and vigour. Altogether this is indeed as pretty a little garden as we could really wish to see, and highly creditable to Mr. Kirk.

CALLENDAR PARK.

This grand old place, the seat of William Forbes, Esq., is situated midway between Edinburgh and Glasgow on the Main North British line, and is reached in forty minutes' ride from either place. Fruit is extensively grown both outside and in. The forcing department is situated in the kitchen garden, and is a very fine range of large lean-to houses separated in the middle by a large three-roofed ridge-and-furrow greenhouse, and comprises six vineries and two Peach houses. The first house we enter is a late vinery and filled with Lady Downe's. It was carrying a fine even crop with rather large bunches for this variety, although we failed to observe any so large as the two sensational bunches exhibited from this place last year at the Dundee International Show. They were indeed exceptional bunches, being 16 inches in length, well filled and shouldered, and perfect in finish. The next house we entered was truly a magnificent sight. All Black Hamburgs, and they truly deserved the title. As a houseful of better bloomed, finer finished Grapes it has not been our good fortune to see. From top to bottom, back wall included, dense clusters of fruit hung in rich profusion. From this house were cut the two grand bunches which were so much admired, and which carried off first honours at the recent Show of the Royal Caledonian Horticultural Society, Edinburgh. The next house was also filled with Black Hamburgs for late use, and were looking well. Next is a mixed house, comprising Alicante, Gros Guillaume, Muscat Hamburg, West's St. Peter's, Muscat of Alexandria, Madresfield Court, &c., the latter very fine; also Muscat Hamburg, large in bunch and berry. This variety is exceptionally well grown there, and few have been so successful as Mr. Boyd in getting it coloured. He is the holder of two Veitch Memorial medals, both gained with this variety. Of the remaining two vineries one contained a good crop of useful late varieties; the other, young Vines, from which we may expect something good, judging from their robust health and the wonderfully strong short-jointed canes they had made. They were carrying a few good bunches on each rod, the most notable of which were Gros Colman, Alnwick Seedling, Champion Muscat, Muscat Hamburg, Golden Queen, and Golden Hamburg. Two Peach houses finish this fine range of glass, both filled with healthy trees and bearing an even crop. In one house we noticed some good Plum trees in pots, ripening a fine crop, principally Blue Orleans, Prince Engelbert, and Green Gage.

If I have not already trespassed too far upon your space I should like to say a word upon the Melons, the culture of which deserves more than passing notice. Leaving the vineries, we passed a large span-roofed plant stove, in the centre of which, planted out, were some wonderful clusters of Bananas remarkable for their size. We were shown the photograph

of a cluster grown here several years ago, which measured 4 feet 6 inches in circumference and 26½ inches long. Unfortunately its weight was not ascertained at the time, but was calculated to be not less than 100 lbs. The Melons occupy four spacious pits in different stages, and are wonderful examples of cultivation. In one house a little over 20 feet long we counted over forty fruits that would average 5 and 6 lbs. each, finely shaped and beautifully netted. They included, besides some of the best varieties, a few very promising seedlings raised in the place, William Tillery, Eastnor Castle, Best of All, and Blenheim Orange being particularly fine. The system adopted in their cultivation is one of close stopping and planting 18 inches between each plant, and but one leaf to each lateral. Three fruits are taken from each plant, and are ready for cutting in five weeks from the date of planting. Figs are grown on the north half of the span, and were bearing a good second crop of fruits. Two other pits are filled with healthy well-grown Pines swelling off fruits of Queens and Smooth Cayennes, the two varieties principally grown.

Mr. Boyd, the gardener in charge of this establishment, has for many years been a very successful exhibitor at most of the principal shows both in England and Scotland, and everything under his charge fully bears out the high reputation he has gained as a fruit-grower, and to his courtesy and kindness we are indebted for much of the pleasure we derived from our first visit to Callendar Park.—DUNCAN BUCHANAN.

ROYAL HORTICULTURAL SOCIETY.

JULY 28TH.

VARIED tastes might be gratified in the conservatory on this occasion. The central tables at the east end were occupied by as fine exhibits of Carnations and Picotees as have ever been seen at the National Society's shows of these beautiful flowers, and in contrast on the side tables were banks of gorgeous Begonias, diversified groups of flowers of hardy herbaceous plants, extensive assortments of Gloxinias, a fine display of Pine Apples, and, considering the season, a wonderfully fine exhibition of vegetables in competition for the prizes offered by Messrs. Sutton & Sons, Reading.

In the Begonia competition Messrs. J. Laing & Co. had a grand field day, securing the first prizes in every class in the easiest possible manner. In the group not exceeding fifty plants they had in fact no competitors, yet nevertheless won the first prize of £5 with admirably grown and brilliantly flowered examples.

In the class for nine plants they were far away ahead, staging beautifully grown examples from 2 to 4 feet high and the same in diameter; second Mr. Bealby with very small plants.

In the class for six double-flowered varieties the same well known firm secured the first prize with plants ranging from 18 inches to 2 feet high and the same in diameter, laden with massive flowers. The varieties were—Lady Hulse, white, free; The Czar, scarlet, dazzling; Mr. Brissenden, orange scarlet; Mr. Howe, buff; Goliath, cerise; and Mrs. Brissenden, rosy salmon; Mr. Bealby, The Laurels, Roehampton, securing the second prize with much smaller plants.

In the class for six Tuberous Begonias (nurserymen excluded), W. N. Cheesman, Esq., the Hall, North Dulwich, (gardener, Mr. Monk), secured the first prize with well-flowered examples 2 to 3 feet high and through; second, Mr. Bealby with small plants; third, Mr. W. H. Apthorpe, Cambridge, with vigorously grown yet not large examples.

Gloxinias.—The first prize offered for these was awarded to six plants belonging to Colonel the Hon. W. P. Talbot, Esher (Mr. Waite, gardener). They were not large but healthy, and the exhibitor never won £3 more easily.

In the class for six pots of Liliiums in not less than three varieties we only saw one collection, for which the first prize was awarded to Mr. J. S. Ware, who staged *L. auratum*, *L. pardalinum* Michauxi, *L. Humboldtii* ocellatum (both scarlet with lilac spots), *L. chalcedonicum* maculatum, *L. Browni*, and the elegant *L. philippinensis*.

Carnivorous Plants.—The first prize was adjudged to Mr. James, Castle Nursery, Lower Norwood, for a neat, interesting collection, that attracted much attention from visitors, R. R. Hyatt, Esq., having the second prize for a less varied collection.

Achimenes.—The only plants we observed were those to which the second prize was awarded. They were staged by Mr. Luff, gardener to R. R. Hyatt, Esq., Streatham—well-grown pans, but past their best condition.

Group of twenty-five miscellaneous plants.—In this class Mr. James was placed first with a bright and neat assortment of small plants; R. R. Hyatt, Esq., second, but the display was the reverse of imposing.

Mr. Ware was awarded the first prize for a collection of twelve Pentstemons, also for a collection of cut blooms of herbaceous plants, a truly remarkable exhibit, comprising 180 species and varieties.

VEGETABLES.

Several collections were staged in competition for the prizes offered by Messrs. Sutton & Sons, and all of them were good. Mr. Richards, gardener to the Earl of Normanton, Somerley Park, was first with imposing dishes of Cauliflowers, Onions, Artichokes, Carrots, Tomatoes, Kidney Beans, Potatoes, and Peas. Second, Mr. M. C. Waite, The Gardens, Glenhurst, Esher, Tomatoes and Onions being remarkably fine. Third, Mr. Haines, The Gardens, Coleshill, Berks, his collection including an excellent dish of Mr. Muir's excellent Vegetable Marrow Pen-y-byd, good Peas, Tomatoes, and Cauliflowers. Fourth, Mr. T. N. Beckett, Cole Hatch Farm, Penn, Bucks. Fifth, Mr. James Neighbour, Bickley Gardens, Kent. The prizes offered for Sutton's All Heart Cabbage and Earliest of All Savoys were taken by the following exhibitors—first, Mr. James Neighbour; second, Mr. Osman, Sutton, Surrey; third, Mr. P. Cornish, gardener to J. Downing, Esq., Enfield, all of whom staged good examples of these useful varieties.

FRUIT COMMITTEE.—Harry J. Veitch, Esq., in the chair. Mr. R. Nicholls, The Gardens, Castle Hill, South Molton, sent eighteen Pine Apples of the Smooth Cayenne variety, which weighed in the aggregate 126½ lbs., to which a silver-gilt Banksian medal was awarded. Mr. Stephen Castle, The Vine-

yard, West Lynn, Norfolk, sent two varieties of seedling Tomatoes, which were passed. Mr. T. C. Worsley, Linslade Nursery, Leighton Buzzard, sent a seedling Melon which was not quite ripe. Mr. James Bolton, The Gardens, Coombe Bank, Sevenoaks, sent a Gooseberry called Bolton's Prolific, which has been exhibited twice before the Committee. Its chief recommendation is its good bearing properties, but it is not particularly early. Mr. Isaac Harrison, of Leicester, sent a seedling Apple, which had also been exhibited in November last, but it has now passed its season. Mr. J. Merryfield, The Gardens, Waldershare Park, Dover, sent a seedling Raspberry called "Superlative," but it was considered to be too near others already in cultivation. Mr. Charles Ross, The Gardens, Welford Park, Newbury, sent a seedling Grape from Black Monukka, called "Mrs. Eyre," which was not ripe, and without flavour. He also sent two Melons that were not approved of.

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair.

A silver-gilt Banksian medal was worthily granted to Messrs. Sutton and Sons, Reading, for a great and in every way admirable collection of 160 Gloxinias, characterised by free growth, large flowers, and clear and decided colours. The same firm also staged an effective assortment of double Stocks and Hollyhocks.

A silver Banksian medal was awarded to Messrs. Hooper & Co., Covent Garden, for a beautiful collection of seedling Gloxinias, the majority of them spotted and of great merit. They had a pretty effect amongst *Adiantum* margined with *Isolepis*.

Messrs. Veitch & Sons staged amongst other plants spikes of the distinct and brightly attractive hybrid spotted *Gladiolus Lemoinei*, which has been previously certificated, the clear yellow in the segments rendering it very striking. They also staged *Olearia Haasti*, one of the most floriferous summer-flowering evergreens in cultivation.

The Hon. and Rev. J. T. Boscawen exhibited a wonderfully vigorous plant of *Lælia purpurata*, with six trusses of very large flowers, and leaves 18 inches long and 3 inches wide. This plant well merited the vote of thanks awarded. The New Plant and Bulb Company, Colchester, exhibited fine cut spikes of *Lilium auratum*, and dwarf plants of the variegated *Lilium longiflorum*, for which a vote of thanks was awarded. Mr. Perkins, Leamington, exhibited plants of decorative *Pelargonium Volonté Nationale* album, which has been previously certificated. Mr. Cannell exhibited a group of the extremely valuable double Ivy-leaved *Pelargonium Madame Thibaut*, characterised by sturdiness of growth, floriferousness, and huge trusses of pink flowers. This plant ought to find its way into every greenhouse in the land, and will no doubt do so; also very fine Begonias and stands of Carnations and Picotees. Messrs. Laing & Co. also staged a remarkable collection of cut flowers of Begonias. Mr. Ware exhibited *Gaillardias*, which were commended, and a vote of thanks was awarded to him for *Dianthus Napoleon III.*—good examples of this richly coloured variety.

CERTIFICATED PLANTS.

Begonia Thwaitesii (Veitch).—An ornamental-foliaged species from Ceylon, the leaves 4 or 5 inches in diameter, green, of plush-like texture, blotched with greenish white; habit dwarf, flowers white.

Begonia Prince Henry (Sutton & Sons).—A striking variety with small foliage and a profusion of coral-red flowers, somewhat resembling those of *B. Ingrami*, but larger and in all respects better. It is the result of a cross between a seedling from the Tuberous Begonia *Davisi* and a seedling raised from *Begonia Rex*. Its origin is thus remarkable, and there is no question as to its distinctness and great decorative value for fringes to larger plants. The same firm was also awarded a vote of thanks for a seedling raised from *B. semperflorens* and *B. Schmidtii*. It resembles the former parent more than the latter, but is distinct from both and remarkably free.

Begonia Marchioness of Lothian (Cannell).—With huge, pendent, creamy white Hollyhock-like blooms. Well grown in a basket or suspended, this variety must have a striking effect.

Begonia Picotee (Cannell).—A double variety, rosy pink, the edges of the petals clearly margined with white, like the wire of a Picotee.

Begonia Marquis of Stafford (Laing).—A double variety with cherry crimson flowers; plant dwarf, and very floriferous.

Campanula Hendersonii (Ware).—Dwarf, dense in habit, not exceeding 1 foot high, with large clear blue flowers 1½ inch in diameter, resembling *C. turbinata*.

Olive Carnation The Governor (Cannell).—Large, smooth, broad-petalled pure white flowers, evidently a very fine variety.

Draccephalum virginicum album (Ware), with effective dense spikes of white flowers, resembling at a distance large sprays of *Ericas*.

Helenium pumilum.—Exhibited by Mr. Ware, a valuable old yellow-flowering herbaceous plant, represented by some of the finest flowers we have seen. A figure is given on page 95 which well displays the character of the flower.

Marigold Miniature Orange African (Carter).—A small compact form, bright and attractive.

Pelargonium Josephine de Hohenzollern (Bealby).—A fine free-growing Ivy-leaved variety, with double crimson scarlet flowers.

Pelargonium Paul Charbonnier (Bealby).—Dwarf double scarlet, resembling Wonderful.

Rhododendron incarnatum floribundum (Veitch).—One of the greenhouse varieties, remarkable for its floriferousness, every stem terminating with trusses of miniature trumpet-like flowers; a curious mixture of buff and rose colour, distinct and attractive.

SCIENTIFIC COMMITTEE.—A. Grote, Esq., in the chair.

Fungus Poisonous to Pheasants.—Mr. W. G. Smith reported that he had ascertained that the fungus which had proved poisonous to pheasants, as mentioned at the last meeting, was *Agaricus trachysporus*. Colonel Clarke mentioned having seen squirrels eating *Agaricus*.

Odontoglossum nebulosum with Three Lips.—Dr. Masters reported on the flower from Dr. Duke submitted to him at the last meeting. The segments of the perianth were normal, as also the single perfect stamens. Midway from either side of the column proceeded a lip-like petal wholly detached from the lip. There was no trace of the three inner stamens, nor of the stigma.

Cones of Abies brachyphylla.—Dr. Masters showed cones of this comparatively new Japanese Conifer grown by Messrs. Veitch at their Combe Wood

Nurseries. They were of oblong form, and of a rich purple plum-like colour, similar to those of A. Webbiana, but smaller. The tree in question is one of the handsomest and hardiest of its class, and grows rapidly.

Books Received.—Various donations were acknowledged for the library. The meetings of the Committee were then adjourned till November 10th.

A RECTORY GARDEN.

GARDENS which have become famous, and consequently special objects of attraction, exist in large numbers in all parts of the kingdom. It is not, however, in these alone that noteworthy examples of high-class gardening are to be seen, but oftener in some quiet country garden away from towns, new ideas and methods of culture are quietly being worked out. It is about an interesting garden of the latter class that I now give a few descriptive notes. Kent has been justly termed the Garden of England, and it was to one of its southern points that I received an invitation a few weeks ago to visit Canon Hodgson's charming gardens at Saltwood Rectory near Hythe. The journey by rail from town occupies about a couple of hours, passing through the most interesting and fertile districts of the country, in which Hop gardens and fruit orchards form a special feature. The traveller has to change carriages at Westenhanger station, which is only about three miles from Saltwood, and if he enjoys a walk and can admire beautiful scenery, it is best to perform the journey on foot. If not, then a few minutes by rail through huge cuttings, each side of which is clothed with most charming variety of wild plants, Gorse, and Broom in flower, here an opening revealing the most lovely landscape, and finally a gradual and increasing glimpse of the Channel, with Dungeness Point in the distance, and Hythe is reached, one of the most rural of seaside resorts, with its conspicuous Martello towers along its beach nestling at the foot of an amphitheatre of hills.

The village of Saltwood is within ten minutes' walk of Hythe station, and is one of those quaint rural spots which has escaped the greedy hand of modern builders. Quaint old-fashioned cottages, with their sides and ends covered with Roses and other climbers; forecourt gardens of charming Snapdragons, Lilies, and other good old-fashioned plants; trees laden with promising crops of fruit and large plots of useful vegetables; ruddy faces of the apparently healthy occupiers suggest the happy contentment and condition of a rural life. The Rectory house and the church are situated within close distance of each other. Judging from the outward appearance of the latter it certainly bears the stamp of honoured age, and is a good type of the old village church. The Rectory house is one of the old-fashioned, commodious, and substantially built type usually met with in villages.

FRUIT AND VEGETABLE GARDEN.

Surrounded, then, as Canon Hodgson is by Nature in all her simple beauty, can it be wondered at that he possesses such a passionate love for gardening? But the reverend Canon is, to use a common phrase, a horn gardener, having from a youth been an enthusiastic cultivator and exhibitor of Pansies, Gladioli, and Roses. Nor is he less successful in other branches of gardening; fruit, especially Pears, Strawberries, and Raspberries, and vegetables are well looked after here. The Pear trees, both cordon and pyramid, were fine healthy trees, and the whole of the cordons were carrying fine crops of fruit. Particularly worthy of note were Beurré Rance, Marie Benoist, Beurré Superfin, Olivier de Serres, Pitmas-ton Duchess, usually a shy bearer but succeeds well here, Maréchal de Cour, Princess Marie Louise d'Uccle, Doyenné du Comice, and a number of others. A few good sized bush trees of the serviceable Catillac were carrying heavy crops. Promising trees of such capital sorts of Apples as Stirling Castle, Ecklinville Seedling, Warner's King, Lane's Prince Albert, Golden Noble, Sandringham, The Queen, Worcester Pearmain, and Sturmer's Pippin augured well for a good crop. In the same vegetable garden as the foregoing fruit trees were growing were some capital rows of Harrison's Eclipse Pea, a first-rate early and prolific variety.

HARDY PLANTS.

On each side of the central walk were borders full of such showy herbaceous plants as *Leucanthemum maximum*, *Campanula persicifolia* alba, snow white masses of the lovely *Iberis gibraltarica*, Pinks, and a large quantity of the best strain of Brompton Stocks we have seen for some time. It is only just to say that the seed of the latter was supplied by Messrs. Veitch & Sons. A good-sized plant of the comparatively rare *Rosa rugosa* alba is worthy of note as being a capital companion to its congener *R. rugosa*, and growing against the south wall were vigorous young trees of Marie Van Houtte and other Tea Roses laden with lovely blooms.

PELARGONIUMS.

At the lower end of this wall stands a substantially built vinery, which, however, has to do duty as a greenhouse too, as the glass erections are not extensive. Notwithstanding the fact that plants are grown largely in this house, the Vines were carrying a first-rate crop of Black Hamburgh Grapes. The Vines were comparatively young, but owing to generous treatment both stems and foliage were remarkably robust and large—a credit to the Canon and his able gardener, Mr. Shoesmith. Among the many specialities grown there so successfully is the Zonal type of Pelargoniums. All the best, newest, and most striking in colours find a home in this garden. The front stage of the vinery just mentioned was filled with such capital sorts as Mrs. Lord, a fine glowing crimson; Aglaia, intense crimson, large pips; Lord Mayo, a well-formed double pink; Lady Reed, white, with salmon eye; Sophie Birkin, a good variety of the oculated type; Sunbeam, brilliant crimson; Queen of the Belgians, a first-rate silver white; Edith Little, a very effective variety,

white, with a shade of plum colour; Metis, rich scarlet, individual blooms very fine and truss large; Paul Charbonnier, a very fine double scarlet; Le Cygne, double white; Constance, single pink; and Golden Glory, a very rich crimson. The foregoing list is only an enumeration of the most striking varieties that were so conspicuously in flower at the time of our visit. Named varieties of Gloxinias are also a feature here, many of which were in flower. The Duchess of Connaught is a beautiful variety, with crimson-and-white blooms. This variety is considered to be identical with another so-called variety, sent out under the name of Duchess of Edinburgh; Mrs. Bause, white and pink; Lord Derby, purplish blue; Lady Brookes, white and violet; Lady Musgrave, red; and Nydia, purple, being also noteworthy varieties.

PANSIES AND ROSES.

Situated within a short distance of the latter garden is another vegetable, fruit, and Rose garden combined. There even the most unpractised eye could discover the trace of a master hand in the cultivation of its contents. This garden is in a capital situation, sloping well to the south with a deep, rich, and alluvial loamy soil. The first thing to arrest attention is a large bed of the best varieties of Pansies. Canon Hodgson is a great admirer of these chaste and lovely flowers. We can only note a few of the most striking varieties in passing, among which Lord Beaconsfield, yellow, with rich velvety centre; Miss Bury, centre white, with an outer band of purple; Danger, a fine rich purple self; James Morgan, popularly called the Wallflower-coloured; Evelyn Bruce, Buttercup, Mrs. Taylor, and Mrs. Llewelyn, one of the new yellow bedding type, are deserving of special note.

Now we come to the plantations of Roses—standard and dwarf Hybrid Perpetuals. About 150 are grown on standards and the same quantity as dwarfs, and on these robust, healthy, and clean trees and bushes are grown the many fine examples of blooms which have been so successfully exhibited at the various horticultural shows. Nearly all the so-called "miffy" varieties succeed well, the excellent soil and deep cultivation practised, and the bracing healthy air, thoroughly indicating by the texture of foliage and robustness of growth that Roses find a congenial home there. We must not forget to mention how well that charming, but usually somewhat difficult to manage Rose, A. K. Williams, succeeds here. Mr. Shoesmith informing us that he experiences no trouble in growing and flowering it successfully under the same treatment as the others. Mr. Shoesmith is a firm believer in close pruning, and the plants certainly testify that his practice is sound. Heavy mulchings of manure are spread over the ground so occupied by the Roses, which is an excellent preventive of excessive evaporation.

Perhaps the most interesting feature of all to those who admire Tea Roses, and can appreciate a feast of their exquisite, sweet, and delicately coloured blossom during the early days of June, is the collection growing against a wooden fence, 4 feet high, and upwards of 100 yards long, at the south bottom of this garden. This fence was originally occupied by low-trained Plum trees, but as might have been expected, the latter was unsatisfactory. Canon Hodgson, wishing to grow Tea Roses, consulted his present gardener a year or two ago, and the latter hit upon the idea of utilising this fence. The ground was accordingly heavily manured and deeply trenched to the width of 4 feet, and in this the best varieties of Teas were planted. To guard against the north winds, a simple but efficient protection is used in the shape of wooden sheep hurdles, placed at a distance of 4 feet from the fence, between the bars of which branches of Gorse and Broom are interwoven. Here the young trees found a congenial home, and soon repaid both owner and gardener for the expense and trouble bestowed on them. So well did they succeed last year, that blooms shown at Canterbury won the bronze medal of the National Society. As a guide to others who may wish to adopt a similar plan, I give the names of the sorts that succeed the best here. The following were specially noticeable on account of size, form, depth, and purity of colour—Hon. Edith Giffard, Anna Ollivier, Etoile de Lyon, Catherine Mermet, Marie Van Houtte, J. Ducher, Perle des Jardins, Madame Lambert, Souvenir d'Elise, Souvenir d'un Ami, Innocente Pirola, Comtesse de Nadaillac, Francisca Kruger, a new and but little-known Tea Rose in English gardens, and Princess of Wales, one of Burnett's Pedigree varieties. With such sterling novelties as these, Canon Hodgson will probably be well to the front at the exhibition table this season.

AN EXAMPLE OF TRENCHING.

Much discussion has been going on in the Journal latterly about the value of deep trenching, and if an example of its value were needed I could certainly point to one instance of success, and that in the vegetable gardens here. I was astonished to see such fine plantations of Strawberries, Raspberries, and other vegetable crops. A plantation of President Strawberry, one year old, was marvellously vigorous, each individual plant measuring 2 feet in diameter. Not less worthy of note was another plantation of Dr. Hogg, the fruit last season averaging fourteen to the pound. Nor is this extraordinary vigour maintained at the expense of a good crop of fruit, as the crowns were bristling with buds and young fruit. Strawberries are special favourites with Canon Hodgson, hence one is not surprised to find good examples of such new varieties as Laxton's Captain and King of the Earlies amongst his collection. So much does the Canon enjoy this luscious fruit, that it is no uncommon thing to see him amongst his Strawberry beds at four o'clock in the morning.

A peep into a frame ground close by reveals a capital batch of sturdy Chrysanthemums which promise to yield blooms, which, if slightly in advance of those shown by Mr. Shoesmith at the Aquarium last autumn, will not be far behind others this year. He is only a tyro in growing

for exhibition, but if the plants at all respond to his energetic and persevering treatment, he will not fail to eventually attain success.

THE AMERICAN GARDEN.

But what about the flower garden and pleasure grounds usually described first? some will be inclined to ask. Well, these have no pretensions to special notice, being of the simplest description. A few shrubs, Rose beds, and a little bedding out, together with a fine specimen of Cedar of Lebanon, are the chief characteristics of the grounds surrounding the house. The visitor might turn away disappointed at finding such a meagre illustration of ornamental gardening as surrounds the rectory house, and imagine the owner to be a strict utilitarian, growing only the useful and despising the ornamental in gardening; and then, as if to offer some solace for the temporary disappointment, we are asked to take a stroll across a few meadows to see what in the distance resembles a coppice of Oak and other forest trees. A walk of five minutes brings us to an ancient-looking door. Passing through this and over a foot bridge across the railway which runs into Hythe, we are on the confines of the apparent coppice. We pass through, and between the branches of trees and shrubs, and descend into a valley for a few yards, when a most charming sight is revealed, huge masses of every conceivable colour of Rhododendron and hardy Azaleas blending and harmonising with the vast belting and canopy of foliage afforded by the Oak and other forest trees above. This is known as the American garden for miles around, visitors coming from Folkestone, Deal, Dover, and Hythe to see this charming spot in May and June. Canon Hodgson has bills printed and distributed inviting persons to come, and I need hardly say how readily this invitation is accepted. No restriction is placed on their perambulations, a key being given to every party by the gardener, and thus they go unrestricted, evidently valuing the Canon's generosity, and not one instance is known of their taking advantage of this freedom to pluck a single flower of these choice shrubs. Sixty years ago Archdeacon Croft, a former rector of Saltwood, and a great patron of horticulture, discovering certain natural advantages in this wood for forming an American garden in the shape of a natural bed of peat along the bottom of the valley, with ample shelter on all sides in the form of forest trees, at once resolved to turn them to account. Great taste was shown in the formation of the various walks, and in the selection and disposition of the many lovely varieties and species of Rhododendrons. Up through the centre of the valley is a beautiful green sward of turf, and here and there, towering up to the sky, are grand specimens of *Picea nobilis*, 40 feet high; *Abies Cunninghamii*, 40 feet; a noble specimen of the Redwood Cedar, *Juniperus virginiana*, pronounced by Dr. Hooker to be one of the finest in England; *Wellingtonia gigantea*, *Araucaria imbricata*, *Taxodium distichum*, *Juniperus recurva*, and *Cryptomeria japonica*. Other choice trees, such as the *Paulownia imperialis*, which, on the authority of the late Dr. Lindley, to whom Archdeacon Croft sent blooms at the time, was the first to bloom in England, and which is a truly noble tree; *Magnolia speciosa* and *glauca*; *Kalmia latifolia*, a very fine example over 8 feet high; *Spiraea Fraseri*, a charming shrub, so graceful in habit; and *ariefolia*, another very large specimen of the genus *Spiraea*, are a few of the interesting and beautiful trees growing in this lovely spot.

RHODODENDRONS.

Interesting and valuable as these noble specimens of trees are, they could not compete in loveliness with the charming floral display of Rhododendrons. Such huge trees (for some were certainly entitled to be designated thus, owing to their great size) of that showy old species *ponticum*, *Blandyanum*, *fastuosum* fl.-pl., and a number of others, with smaller plants of Mrs. John Clutton, Marshal Brooks, rich scarlet; Sigismund Rucker, magenta; Princess Mary, light blush; Mrs. John Penn, salmon pink; Kate Waterer, rich crimson; Lady Eleanor Cathcart, rose; Baron Schroeder, plum colour; W. E. Gladstone, a lovely pink; The Queen, blush; and Marchioness of Lansdowne, rose, were a perfect mass of blossom, and rendering it a sight not easily to be forgotten. These are simply a few of the most striking examples; suffice it to say that every variety worth growing will be found here. A few splendid clumps of *Azalea indica alba* were one mass of snowy whiteness. These had been planted with great taste and judgment, for here and there they added life to the picture by brightening up dull places. Wending our way through the many walks we came upon several real treasures and surprises. In one spot we saw two huge specimens of *Camellias* which had grown to an enormous size. *Alba plena* was just going out of flower, as was also another specimen with red flowers. These must have been a grand sight, judging from the immense quantities of fallen petals on the ground. Another curious shrub we found in flower on the side of one of these walks. Sir Joseph Hooker, who had been there a few days previously, states that its name is *Illicium religiosum*, and that it has not flowered out of doors in England before. It is a member of the *Magnolia* family, bearing dingy white flowers and dark green shining foliage. A little higher up the valley is a bog garden, which is in course of formation by Canon Hodgson. This was recently planted with a number of *Iris germanica* and other bog plants, which will in time form an interesting addition to the features of the American garden. A very fine specimen of *Camellia* stands in an isolated position on the turf, also there is a portion remaining of a once large specimen of the Cork Oak (*Quercus suher*), but this is now dying or dead. The *Magnolias* look perfectly at home, as indeed do all of the other trees and shrubs enumerated. Of course there are great natural advantages in the shape of just the soil suitable for this class of plants, shrubs, and trees, and another important gain, a capital shelter from cold winds. Canon Hodgson, certainly deserves to be congratulated for continuing the objects of his predecessor in keeping this

beautiful spot in such excellent form by continual planting of new varieties of Rhododendrons, and his sons in filling up their leisure moments in thinning out dead branches, and the gardener on the general good condition and order of this truly charming American garden.—T. W. S.

NATIONAL CARNATION AND PICOTEE SOCIETY'S SOUTHERN SHOW.

JULY 28TH.

IN no previous year has the above Society had a better or more successful show than that held at South Kensington on the date named. In quantity, and more markedly in quality, the exhibits were fully equal to the average. Those redoubtable growers and showmen of Carnations, Mr. Turner of Slough, and Mr. Douglas of Ilford, were in grand form, and were responsible for the leading prizes in the principal classes, while other noted exhibitors were also present. Throughout the Show there was praiseworthy evidence of high-class culture, the majority of the blooms being

Fig. 17.—*Helium pumilum* (see page 93).

noticeable for large size and clearness of colours. The following is a list of the prizetakers in the various classes, commencing with

CARNATIONS.

The principal class for these was that for twenty-four blooms, not less than twelve dissimilar varieties. The first prize was taken by Mr. C. Turner, Royal Nurseries, Slough, with superb blooms of the following:—Back row—Master Fred, John Ball, H. K. Mayor, Jas. Douglas, Rob Roy, Jas. Taylor, W. M. Hewitt, and Robt. Lord. Middle row—Robt. Lord, Sir G. Wolseley, E. S. Dodwell, Sarah Payne, John Harland, Sybil, Henry Matthews, and Wm. Skirving. Front row—Sarah Payne, Rob Roy, Arthur Medhurst, Jessica, Wm. Skirving, Hy. Cannell, Sir G. Wolseley, and Fred. Mr. Turner's Carnations have long been famed, but it may be confidently said that no better blooms were ever previously staged than these. Every flower was of considerable size, symmetrical, and remarkably clean. The second prize in this class was awarded to Mr. Jas. Douglas, gardener to F. Whitourn, Esq., Great Gearies, Ilford, who also showed splendid blooms. They were arranged as follows:—Back row—Jas. Douglas, Hy. Cannell, S. Barlow, Sybil, Jas. Douglas, Matador, Moore's No. 8, and Seedling No. 4. Middle row—Robt.

Lord, Miss Gorton, Miss H. Lidge, Jas. Crossland, a seedling, Rob Roy, F. Nightingale, and Master Stanley. Front row—Rob Roy, Mrs. Barlow, Fred, F. Whitbourn, Maste Fred, Jas. Crossland, a seedling, and Sarah Payne. These were somewhat smaller than the first-prize blooms, but were otherwise admirable. Mr. John Hines, 81, Branford Road, Ipswich, was placed third. The fourth prize was awarded to Mr. F. Hooper, Vine Nursery, Widcombe Hill, Bath; and the fifth to Mr. T. Garratt, South Hill, Bishops Stortford.

There were five exhibitors in Class B for twelve blooms, dissimilar. Mr. Joseph Lakin, Temple Cowley, Oxon, was adjudged the first prize. He showed good blooms of the following varieties:—Back row—Jas. Douglas, Capt. Owen, Ranger Johnson, and Sarah Payne. Middle row—Robt. Lord, Dolly Varden, Thomas Moore, and Fred. Front row—A seedling (rose bizarre), a seedling (purple bizarre), Admiral Curzon, and Thomas Anstiss. Mr. Douglas was again second, but he made an even closer fight in this than in the former class. Good blooms of Sybil, Jas. Crossland, Matador, and Mrs. Gorton were noticeable in his collection. Third, fourth, and fifth prizes were awarded respectively to Messrs. J. Buxton, 27, Manor Street, Clapham; J. Hines, and T. Garratt. Class C, for six dissimilar blooms, saw M. Rowan, Esq., 36, Manor Street, Clapham, to the fore. He showed large, fresh, and symmetrical blooms of George, Wm. Skirving, Jessica, E. S. Dowell, Florence Nightingale, and Clipper. Mr. Thomas Anstiss, Brill, Bucks, was second with smaller but fresh blooms of Florence Nightingale, Henry Cannell, George, Sarah Payne, Harrison Weir, and Robt. Lord, Mr. G. Wynn, gardener to H. Morris, Esq., The Nest, Hayes, Kent, was placed third, also with excellent blooms, Aubrey Spurling, Esq., The Nest, Blackheath, fourth, and Mr. Glasscock, South Street, Bishops Stortford, fifth. There were ten competitors in all in this class. The classes for single specimens of bizarres and flakes produced, as might have been expected, some grand blooms. Scarlet Bizarres.—The first prize for these was awarded to Mr. Jas. Douglas for Arthur Medhurst, and the same exhibitor and variety were responsible for the second prize. Mr. C. Turner received third and fourth prizes for blooms of Robt. Lord, and Mr. Lakin secured the fifth prize with the same variety. All were good, Crimson Bizarres.—Mr. Turner was awarded first prize for a very fine bloom of John Harland; a seedling from Mr. Douglas took the second prize. Mr. Lakin was third with Master Fred, Mr. Douglas fourth with the same variety, and Mr. Lakin fifth with Thomas Anstiss. Pink Bizarres.—Mr. Charles Turner was again first in this class, a beautifully clear and symmetrical bloom of Sarah Payne winning him the prize. Mr. Douglas was second and third with Wm. Skirving, Mr. Turner fourth with Jas. Taylor, and Mr. Anstiss fifth with Dr. Symonds. Purple Flakes.—Mr. Turner was once more in the van in this class, securing the first prize with a superb bloom of Jas. Douglas, and the second prize with a specimen of the same variety, but little inferior to the former. Mr. Douglas was third and fourth, also with good blooms of Jas. Douglas. Scarlet Flakes.—Mr. C. Turner was first with a very fine bloom of Matador, Mr. Douglas second and third with Hy. Cannell and Sportsman respectively, and Mr. Lakin fourth with Tom Lord. Rose Flakes.—Mr. Turner was first and second with large and very fine blooms of Rob Roy, Mr. Douglas being third and fourth with the same variety, and Mr. Lakin fifth with Sybil. The premier Carnation was the magnificent bloom of Rob Roy in the back row of Mr. Turner's first-prize collection in Class A. It was a large and perfectly symmetrical flower, well deserving the honour it won.

[PICOTEEES.

The position of the leading exhibitors in the principal class for Carnations was reversed in that for Picotees, Mr. Douglas being placed first and Mr. Turner second. The former exhibitor showed remarkably symmetrical flowers very clear in hue. The following composed his collection. Back row—Brunette, Jessie, Liddington's Favourite, Her Majesty, Liddington's Favourite, Brunette, Jessie, and Mrs. Bowers. Middle row—Mrs. Gorton, Muriel, Princess of Wales, Mrs. Payne, Mrs. Chancellor, Her Majesty, Constance Heron, and Royal Visit. Front row—Constance Heron, Baroness B. Coutts, Mrs. Payne, Mrs. Chancellor, Mrs. Gorton, Princess of Wales, Violet Douglas, and Muriel. Mr. Turner was a very close second, his flowers being larger than those of Mr. Douglas but not quite so clean. He showed the following. Back row—Seedling No. 11, Juliette, Robt. Scott, Liddington's Favourite, Favourite, a light-edged seedling, Lucy, and Dr. Epps. Middle row—Dr. Epps, a seedling, Muriel, Constance Heron, Juliette, Seedling No. 11, Mrs. Bower, and Her Majesty. Front row—Mrs. F. Ricardo, Thomas Williams, Brunette, Baroness B. Coutts, Seedling No. 24, Dr. Abercrombie, Muriel, and Brunette. Mr. D. Hooper was awarded third prize for smaller flowers. Five stands of twelve blooms were staged, and Mr. Douglas was again first. His flowers were: Back row—Brunette, Her Majesty, Liddington's Favourite, and Mrs. Chancellor. Middle row—Mrs. Gorton, Constance Heron, Jessie, and Violet Douglas. Front row—Zerlina, Miss Wood, Mrs. Payne, and Princess of Wales. Every bloom was wonderfully fine and of good size. Mr. Lakin was placed second with smaller but good blooms. Mr. John Hines, Mr. J. Buxton, and Mr. T. Garratt received third, fourth, and fifth prizes in the order in which their names are written. Mr. Thos. Anstiss was adjudged first prize in the class for six blooms, showing fresh good specimens of Clara Penson, Favourite, Purple Prince, Jessie, Mary and John Smith. M. Rowan, Esq., was awarded the second prize for attractive blooms. Mr. Glasscock the third, Mr. H. Catley, 16, Claverton Buildings, Bath, the fourth; and Mr. H. Startup, 3, Stanley Road Bromley, the fifth. There was good competition in the class for single specimens. For red heavy-edged varieties, Mr. Douglas was placed first with a good bloom of Brunette, and second with Princess of Wales. Mr. Sanders was third with Dr. Epps, and fourth with J. B. Bryant; Mr. Turner being fifth with Brunette. In the corresponding class for light-edged flowers Mr. Jas. Douglas took the first and second prizes with Thomas Williams, Mr. Turner being third with the same variety, and fifth with Violet Douglas. Mr. Douglas was first and fourth for purple heavy-edged flowers, securing the chief prize with Muriel, and the other with Mrs. Chancellor. Two good blooms of Muriel won the second and third prizes for Mr. Turner, Mr. Sanders being fifth with Zerlina. The same exhibitors took the prizes for light-edged flowers, Mr. Douglas being first and second with Her Majesty, Mr. Turner third and fourth with Juliette, and Mr. Sanders fifth with Her Majesty. The remaining prizes, those for rose or scarlet-edged blooms and yellow grounds, were taken by the exhibitors last

named and Messrs. Hines, Lakin, and Hooper. The premier Picotee was found in Mr. Douglas's first-prize collection of twelve—a beautiful specimen of Liddington's Favourite, very large and pure.

SELFS, FANCIES, OR YELLOW GROUNDS.

The principal class in this section was likewise for twenty-four blooms, and here again Mr. Turner showed magnificently. His flowers were of immense size, symmetrical throughout, and charmingly clear. His stand, which was deservedly admired, consisted of the following:—First row (back)—The Governor, Prince Henry of Battenberg, Lady Stamford, Guardsman, Florence, and Lady Stamford. Second row—Harry Matthews, Grandiflora, Edith, The Governor, Prince Henry of Battenberg, and E. Adams. Third row—Edith, W. Skirving, Rosa Bonheur, Robert Lord, Janira, and Mary Morris. Front row—Jupiter, Colonel Wood, Cinto de Orion, Polly Cheetham, Mrs. Logan, and Chromatella. Mr. Douglas was placed second; he had an excellent stand of flowers, of good size and colour. Mr. F. Hooper was adjudged third prize; Mr. Catley the fourth; and Mr. G. Meddick, 6, Corn Street, Bath, the fifth. For twelve blooms, dissimilar, Mr. Lakin was deservedly awarded first prize, the following varieties being well represented:—Back row—Sir Toby Belch, The Queen, John Soper, and a seedling. Middle row—Mrs. Medhurst, Mrs. Mostyn Owen, Dean Wood, and Ruby May. Front row—a seedling (purple self), a seedling (rose self), Huson Morris and Mrs. Morris. Huson Morris, Esq., secured the second prize with good blooms, one or two of which, however, were somewhat faded. Mr. Thomas Anstiss took the third prize; fourth and fifth places being taken respectively by Messrs. Aubrey Spurling and W. Maddick. Mr. C. Turner was the premier prize-taker in the class for twelve yellow ground Picotees. His blooms were excellent alike in size and contour, the following varieties being represented:—Back row—Prince of Orange, Mrs. Colman, Prince of Orange, and Ne Plus Ultra. Middle row—Dove, Ne Plus Ultra, Princess Beatrice and Mazzini. Front row—Lady Mary Lascelles, Princess Margaret, Bullion, and Princess Margaret. Mr. Douglas received second prize, his collection also being noteworthy for the size and freshness of the blooms. Class M, for nine specimens in pots, saw Mr. Turner again to the fore, the varieties which won him the premier prize being Matador, Miss Small, Favourite, Mrs. F. Ricardo, Jupiter, Jessica, Lady Stamford, Miss Lee, and Guardsman. Mr. Douglas was placed second with good plants and flowers.

MISCELLANEOUS EXHIBITS.

Most prominent of the exhibits not for competition were the eight splendid stands of cut blooms from Messrs. James Veitch & Sons, Royal Exotic Nursery, Chelsea, which were greatly and deservedly admired. A silver Banksian medal was awarded to them. Mr. P. Perry, gardener to W. G. Rowett, Esq., Woodlands, Cheshunt, exhibited stands of the popular Mary Morris; Huson Morris, Esq., sent blooms of a white seedling, named Ella Morris, which will probably become a favourite. From Mr. Toby, 3, St. Mark's Grove, Chelsea, S.W., came a handsome collection of self Carnations. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, exhibited several stands of very fine cut blooms, also twelve blooms of a new white Clove Carnation named M. T. Walker, which evoked considerable admiration. The flowers were large and pure. The same nurseryman also sent stands composed of large bunches of cut blooms. Mr. H. Cannell, The Home for Flowers, Swanley, Kent, sent stands of cut blooms, which were very attractive.

CERTIFICATES.—First-class certificates were awarded to Mr. Douglas for the following seedlings:—Carnation Rosamond, crimson bizarre, good form, regular flakes of crimson and deep purple; it also received a first prize. Carnation Margaret, rose flake, large flower, broad smooth petals, bright rose flakes; this also received a first prize. Carnation Thalia, rose flake, good broad flake, handsome flower; a second prize was awarded to this. Carnation Grace, pink and purple bizarre, good form, clear, well marked flower; a first prize was awarded. Picotee Dr. Horner. This, though exhibited by Mr. Douglas, was raised by the Rev. F. D. Horner. It is a red, light edged flower, of excellent form, and remarkably pure.

A vote of thanks was accorded to Mr. F. W. Sanders, gardener to J. W. Larking, Esq., The Firs, Lee, Kent, for a yellow self Carnation of good form and colour.

DARLINGTON ROSE SHOW.

WITH Darlington ends the long list of Rose shows which commenced just a month ago at Canterbury, on June 27th, and with it, too, my circuit as a Judge. There may be other shows where Roses are exhibited, but all Rose shows are now over, and exhibitors, judges, reporters, may as far as these are concerned rest on their laurels—or their Cabbages; and while I reserve my notes of the season as a whole I concern myself with the latest, and perhaps the pleasantest, Show of the year. Well, other most pleasant ones rise up before me, and I must not quite say that, but at any rate as pleasant and as well managed a Show as any of its predecessors. As I have before said, Mr. Whitwell is not only "two single gentlemen rolled into one," but he is President, Secretary, Treasurer, Committee, and Manager; an autocrat of the purest type, and showing that where a despot is what he ought to be it is the best form of government to live under.

The Show of 1885 was favoured, as all its predecessors have been, with fine weather, and was held in the usual place, Southend Park, which is kindly lent for the occasion by the Misses Pease; in fact, the weather was too fine for the Roses, but not for the company who came, for the intense heat had been too much for the southern growers. Not one nurseryman came from the south. Messrs. Paul & Son, the two Cants, Prince, and Turner were all conspicuous by their absence. Some of the Midland men were there, the Cranston Company and Frettingham; but the northern men, Harkness, Mack, and May were in full force. The only southern amateur who put in an appearance was Mr. Lindsells of Hitchin, and he was happily successful, as he deserved to be, for his courage. It was not to be wondered at that exhibitors could not come. With the thermometer at 82° it may well be imagined what a terrible ordeal Roses had travelling for six or seven hours on a railway, and I think nothing excited the wonder of rosarians more than the condition in which Mr. Hall brought his Roses from Cheshire. Had the weather been such as to enable all who entered to come it would have been one of the fullest shows of the season; but of

course the absence of so many who had entered made many gaps in the long and beautiful tent in which they were displayed.

Although in following the schedule I take the nurserymen first, yet on this, as on most occasions this year, the amateur Roses were superior. This is not to be wondered at. Growers such as Messrs. Whitwell, Hall, Pemberton, Slaughter, and others, who bestow great pains and labour on their plants, and have them well under command, and being thoroughly good rosarians, studying the wants of each variety, must be in a more favourable position for getting exhibition flowers than those who have tens and hundreds of thousands to look after; but some of the stands to-day were of a high order of merit, especially those exhibited by Messrs. Harkness & Son. The highest class was that for sixty. Mr. Whitwell thinking this quite large enough for the north, and in this Messrs. Harkness & Son were well first with an excellent stand of bright and clean flowers, consisting of Alfred Colomb, François Michelin, Horace Vernet, Marie Verdier, Helen Paul, Charles Lefebvre, Comtesse de Serenye, Ulrich Brunner, Baroness Rothschild, Beauty of Waltham, Eugène Verdier, Prince Arthur, Madame Gabriel Luizet, A. K. Williams, Madame Sophie Fropot, E. Y. Teas, Madame Margottin, Madame Hippolyte Jamain, Pierre Notting, Marie Guillot, Exposition de Brie, Lady Mary Fitzwilliam, Marquise de Castellane, Violette Bouyer, Auguste Rigotard, Marie Rady, Reine du Midi, Dr. Andry, Etienne Levett, La France, Baron Hansmann, Paul Neron, Madame Berard, Emilie Hausberg, Le Havre, M. Hippolyte Jamain, Duke of Wellington, Abel Carrière, President, Louis Van Houtte, Antoine Ducher, Duke of Edinburgh, Innocente Pirola, Edouard Morren, Harrison Weir, Queen of Queens, Star of Waltham, Maréchal Niel, Duc de Rohan, Merveille de Lyon, Madame Clémence Joigneaux, Magna Charta, Marie Finger, Victor Verdier, Madame Willermoz, Duke of Connaught, Duchesse de Morny, Camille de Rohan, and Duchesse de Caylus. The Cranston Company were second, Mr. May equal second, and Mr. Frettingham (Beeston) third.

In Class 2, for twenty-four trebles, Messrs. Harkness & Sons were again first with Ulrich Brunner, Emilie Hausberg, Charles Lefebvre, François Michelin, La France, Paul Neron, Pierre Notting, Merveille de Lyon, Louis Van Houtte, Antoine Ducher, Duke of Edinburgh, Madame Victor Verdier, Peach Blossom, Prince Arthur, Comtesse de Serenye, Fisher Holmes, Marie Baumann, Duc de Rohan, Magna Charta, E. Y. Teas, Violette Bouyer, and A. K. Williams. The Cranston Company were second.

In Class 3, for thirty-six, the same firm again headed the list with Charles Lefebvre, Emilie Hausberg, Alfred Colomb, Merveille de Lyon, Paul Neyron, Beauty of Waltham, La France, Marie Baumann, Madame Willemoz, Duchesse de Morny, Marie Finger, Le Havre, Prince Arthur, Maréchal Niel, Exposition de Brie, Miss Hassard, E. Y. Teas, Duc de Rohan, Magna Charta, A. K. Williams, François Michelin, Prince de Portia, Fisher Holmes, Madame Victor Verdier, Louis Van Houtte, Lady Mary Fitzwilliam, Duke of Edinburgh, Duke of Connaught, Violette Bouyer, Duke of Wellington, Marie Verdier, Prince Arthur, and Ambroise Ducher. Mr. H. May was second, and the Cranston Company third.

In Class 4, for thirty-six distinct varieties, Messrs. Burrell & Co. were first with Marie Rady, Mdle. Marie Cointet, Alfred Colomb, Dupuy Jamain, Princess Beatrice, Charles Darwin, Countess of Rosebery, Baron de Bonstetten, Marie Verdier, A. K. Williams, Sultan of Zanzibar, Innocente Pirola, Louis Van Houtte, Emilie Hausberg, Marie Bernardin, Abel Carrière, Etienne Levett, La France, Star of Waltham, Madame Hippolyte Jamain, John Stuart Mill, Queen of Queens, Merveille de Lyon, Earl of Pembroke, Marie Finger, Prince Camille de Rohan, François Michelin, Duchess of Bedford, Duke of Teck, Charles Lefebvre, Marie Baumann, Comtesse de Nadaillac, Sénateur Vaisse, and Madame Gabriel Luizet. Messrs. R. Mack and Co. were an equal first, and Mr. John Boston third.

In Class 5, for eighteen trebles, Messrs. Mack & Son were first with Alfred Colomb, Baroness Rothschild, A. K. Williams, Comtesse de Serenye, E. Y. Teas, Madame Gabriel Luizet, Charles Lefebvre, Duchesse de Vallombrosa, Madame Victor Verdier, Exposition de Brie, Madame Hippolyte Jamain, Duke of Wellington, La France, Duchess of Bedford, Duchesse de Morny, Dr. Andry, and Horace Verdier.

In Class 6, twelve Teas or Noisettes, Messrs. Burrell & Co. were first with Catherine Mermet, Madame Hippolyte Jamain, Comtesse de Nadaillac, Souvenir d'un Ami, Reine de Portugal, Niphetos, Princess of Wales, Innocente Pirola, Caroline Kuster, Madame Angele Jacquier, Jean Ducher, and Réve d'Or.

In Class 7 for twelve Teas, trebles, Messrs. Harkness & Son were first with Catherine Mermet, Madame Hippolyte Jamain, Maréchal Niel, President, Marie Guillot, Madame Lambard, Marie Van Houtte, Duc de Magenta, Jean Ducher, America, Innocente Pirola, and Madame Berard. Messrs. May & Son second.

We now turn to the amateurs, where Mr. E. R. Whitwell exhibited in grand style, although not in as good form as we have seen him. Having seen his garden I know that late as it was he was not yet fully in bloom; but still his flowers were very grand. In Class P for thirty-six varieties, he was first with La France, Thomas Mills, Captain Christy, Etienne Levett, Merveille de Lyon, Marie Baumann, Marie Rady, Duchesse de Morny, A. K. Williams, Duke of Connaught, Madame Charles Wood, Princess Mary of Cambridge, Eugène Verdier, Louis Van Houtte, Marquise de Castellane, Jean Ducher, Mons. Norman, Camille de Rohan, François Michelin, Alfred Colomb, Charles Lefebvre, Marie Verdier, Madame Victor Verdier, Pride of Waltham, Dr. Andry, Duke of Edinburgh, Baroness Rothschild, John Stuart Mill, Madame Hippolyte Jamain, Le Havre, Comtesse d'Oxford, Madame Lacharme, Lord Macaulay, Belle Lyonnaise, E. Y. Teas, and Victor Verdier. Mr. T. B. Hall of Larchwood, Rockferry, was second with a stand of great excellence, and considering the distance he had come with them they bore proofs of very superior cultivation. In Class 9 for twenty-eight varieties, trebles, the same gentlemen occupied the same position. Mr. Whitwell's Roses were La France, Charles Lefebvre, François Michelin, Alfred Colomb, Madame Hippolyte Jamain, Thomas Mills, Marie Rady, Duchesse de Morny, Pride of Waltham, Mary Baumann, Duke of Connaught, Marie Verdier, Princess Mary of Cambridge, Madame Victor Verdier, Lord Macaulay, Captain Christy, E. Y. Teas, and Merveille de Lyon.

In Class 10, for twenty-four varieties, Mr. Geo. Finlay, gardener, East Layton Hall, and Mr. J. E. Backhouse were equal first. The stand of the former contained, Dr. Andry, François Michelin, Merveille de Lyon, Charles Darwin, Ulrich Brunner, La France, Etienne Levett, Louis Van Houtte,

Black Prince, Marie Baumann, Auguste Rigotard, Marie Finger, A. K. Williams, Sultan of Zanzibar, Baroness Rothschild, Duchesse de Caylus, Gabriel Luizet, E. Y. Teas, Princess Mary of Cambridge, Prince Arthur, Dupuy Jamain, Alfred Colomb, and Marie Rady. In Class 11, for twelve single trusses, Mr. E. B. Lindsell of Hitchin was first with a good stand of Marie Baumann, Victor Verdier, Maréchal Niel, Duchess of Bedford, Prince Arthur, Anna Olivier, Alfred Colomb, Horace Vernet, A. K. Williams, Charles Darwin, Pride of Waltham, and Le Havre. In Class 12, for twelve singles, open to residents within thirty miles of Darlington who have not taken a first prize at a National Rose Society's Exhibition beside Darlington, Mr. Austin Whitton of Bedale was first with François Michelin, Etienne Levett, A. K. Williams, Madame Falcot, John Stuart Mill, La France, Duke of Edinburgh, Captain Christy, Paul Neyron, Souvenir d'Elise, Beauty of Waltham, and Pierre Notting. Mr. F. Myers was second, Mr. John Mitchell third, and Mr. S. Shortt fourth. In Class 13, for nine single blooms, Mr. James Carnegie was first with Camille Bernardin, Madame Berard, Marie Finger, La France, Charles Lefebvre, Alfred Colomb, Duke of Edinburgh, John Hopper, and François Michelin. Mr. James Noble was second, and Miss Fanny Newby, Ouston Hall, Stockton, third. In Class 14, for six distinct, Mr. Jas. Finger was first with Etienne Levett, Captain Christy, Marquise de Castellane, Duc de Wellington, Gabriel Luizet, and La France. In Class 15, for twelve Teas or Noisettes, open to all members, Mr. Eckroyd Claxton was first with a beautiful stand, consisting of Madame Cusin, very lovely, Adrienne Christophle, Catherine Mermet, Alba Rosea, Comtesse de Nadaillac, Marie Van Houtte, Francisca Kruger, Hippolyte Jamain, Madame Lambard, Edith Giffard, President, and Princess of Wales. Mr. T. B. Hall was second. In class 16, for six Teas, Mr. E. R. Whitwell was first with Catherine Mermet, a fine bloom, a little wanting in colour; Innocente Pirola, Bouquet d'Or, Marie Van Houtte, Belle Lyonnaise, and Madame Lambard. Mr. W. Boyes was second, and Mr. Whitton third. In class 18, for twelve blooms of best dark Hybrid Perpetuals, Mr. E. R. Whitwell was first with Marie Baumann, Messrs. Mack & Son were second, and Mr. T. B. Hall third. Mr. Whitwell also took first for the best box of light Roses with La France, one of the most perfect boxes of the flower I ever saw exhibited. In class 19, for the best twelve yellow Teas or Noisettes, Mr. May was first with Maréchal Niel, and in the collection of Moss Roses the Cranston Company was first, and indeed in these two last cases there were no other exhibitors. The silver medal given by the National Rose Society for the best Hybrid Perpetual in the amateur classes was awarded to Mr. Whitwell for a remarkably fine bloom of Etienne Levett, and the silver medal for the best Tea to Mr. Claxton for the bloom of Madame Cusin alluded to above.

I had to leave the Show early, but I find that, as far as attendance is concerned, it is the most successful that the Society has ever held, nearly 6000 persons having been present, and this without any other attraction than a fine day, and the splendid band of the 1st Life Guards, which "discouraged most excellent music." Need I add that all the arrangements, under the practised hands of Mr. Whitwell and Mr. Boyes, were perfect in every respect, and the utmost satisfaction was expressed by all who had the pleasure of being there.—D., Deal.

THE INFLUENCE OF FORESTS ON CLIMATE.

THE third number of *Petermann's Mittheilungen* for this year contains an article by Herr A. Woeikof on the influence of forests on climate. The commencement of a scientific investigation of this subject was made when the Bavarian forest meteorological stations were established, and when Prussia, Alsace-Lorraine, France, Switzerland, and Italy followed the example. As a general rule it may be laid down that in the warm seasons, as between forests and places close at hand which are treeless—1, The temperatures of the earth and air are lower in the former; 2, Their variations are less; 3, The relative humidity is greater. After examining observations as to evaporations, Herr Woeikof states that the influence of forests in diminishing evaporation from water and the soil is so great that it cannot be accounted for alone by the lower temperature of the hot months, the greater humidity, or even by the shade. An important influence, which has hitherto been but little appreciated, is the protection from the wind afforded by the trees, and this the writer regards as more important than all the others together in reducing the degree of evaporation. With regard to the influence of forests on rain and snowfall, there is yet only a single series of observations supplying comparative statistics, and extending over a sufficiently long period. These were taken in the neighbourhood of Nancy, and they show an important influence of forests in increasing the rainfall.

It might appear that the effect of forests on rain in the climate of Central Europe in winter would be small, for the difference between the temperature and humidity of the forest and the open is very little, and the quantity of the moisture in the atmosphere is small. But the observations show that it is at this time of the year that forests get much more rain. This the writer attributes to the clouds being lower, the resistance which the forest offers to the movement of the air, and to the moist west wind. Forests retain rain by the undergrowths of grass, moss, &c., much better than open ground, and let water off superficially only after a heavy rainfall; the remainder filters upwards slowly, and much of it is used for the evaporation of the trees. Although forests, especially thick luxuriant forests, cannot exist without certain supplies of moisture, yet it is the same to them when the supplies come, for they retain what they get and use it over a long period. One example of this is the Lenkoran forest on the west coast of the Caspian, where the vegetation is more luxuriant than in any other part of Europe, yet very little rain falls in summer, but the rainfall in autumn and winter is great. The water is stored up by the forest, and is used in evaporation during the heat of summer. Humidity of the atmosphere, however, is not inconsistent with a high temperature, as the Red Sea shows; but in forests the humidity is due to the evaporation

of the leaves—in other words, to a process by which heat is converted into work, and hence the coolness.

Herr Woeikof then endeavours to ascertain the influence of forests on the climatic conditions of their neighbourhoods in the western parts of the Old World, between the 38th and 52nd degrees N. latitude, the places selected being in all cases in the open. Thus for the 52nd degree eight stations are taken between Valentia in Ireland on the west and the Kirghiz steppes on the east; for the 50th, Guernsey on the west, Semipalatinsk on the east, and thirteen stations, and so on for each two degrees of latitude to 38°. The general result of the observations in fifty stations in six different degrees of latitude is that in Western Europe and Asia large forests have a great influence on the temperature of places near them, and that by their influence the normal increase of temperature as we travel eastward from the Atlantic Ocean to the interior of the continent is not merely interrupted, but they give places far removed from the coast a cooler summer than those actually on the sea. A striking example of this is Bosnia. An examination of the statistics shows—1, That in Bosnia the summer is 2.5° to 4.5° cooler than in Herzegovina; 2, Even on the island of Lissa, in the full influence of the Adriatic Sea, the summer temperature is more than a degree higher than that of Bosnia, which is separated by lofty mountain ranges from the sea. Bosnia owes this comparatively cool summer to its great forests, whilst Herzegovina is almost disafforested. To sum up: forests exercise an influence on climate which does not cease on their borders, but extends over a larger or smaller adjacent region according to the size, kind, and position of forest. Hence man by afforestation and disafforestation can modify the climate around him; but it is an extreme position to hold that by afforestation the waste places of the earth can be made fertile. There are places incapable of being afforested, which would not give the necessary nourishment to trees.—(Nature.)

HORTICULTURAL EXHIBITIONS.

The following list of Shows, with the dates, may possibly be useful for reference.

- August 1.—Liverpool (two days).
 „ 1.—Southampton (two days).
 „ 2.—Antwerp Exhibition of Plants (five days).
 „ 3.—Northampton.
 „ 11.—Royal Horticultural Society (plants and flowers).
 „ 18.—Basingstoke.
 „ 19.—Shrewsbury (two days).
 „ 20.—Salisbury.
 „ 21.—Exeter.
 „ 25.—Royal Horticultural Society (Cottagers' show).
 „ 27.—Ludlow.
 „ 27.—Reading.
 Sept. 2.—Glasgow.
 „ 3.—Abingdon.
 „ 4.—Crystal Palace (Fruit and Dahlias), (two days).
 „ 8.—Royal Horticultural Society (Dahlias and Grapes).
 „ 9.—Edinburgh (two days).
 „ 9.—Northampton (two days).
 „ 27.—Antwerp (fruit and vegetables), (three days).
 „ 29.—Aberdeen.
 „ 30.—Oxford.
 Oct. 7.—Crystal Palace (fruit and Potatoes).
 „ 15.—Royal Horticultural Society (fruit and vegetables).
 „ 27.—Royal Horticultural Society (Chrysanthemums and vegetables).

for days afterwards—spoiling the fruit and wasting the energies of the plants.

MELONS.—The earthing-up of late plants should be completed without much further delay, and in doing so let the soil be trodden down firmly all over the surface of the bed, after which the plants should have their growths re-arranged, the shoots and laterals thinned, and the blossoms impregnated when the pollen is dry, stopping at the same time one joint beyond the fruit. In ordinary seasons artificial impregnation is not necessary, as the bees will do it effectually, but in case of dull weather it will be advisable to resort to it in order to make sure of a good set. Plants swelling their fruit will need the supports put to them in good time. These supports should be suspended in a sloping position to prevent the lodgment of water upon them.

In houses in which plants are swelling their fruits maintain a moderately brisk growing temperature of from 75° to 80° by day from fire heat, increasing 10° to 15° with sun, and 70° at night. In structures where the fruit is approaching maturity let there be a decrease in the atmospheric moisture, which will be readily effected by an increase of ventilation. In pits and frames where the fruits have set too thickly thin them out to four or five to a plant, according to the strength of the plants, as soon as it can be seen which are going to swell. Select the most evenly-shaped fruits, which should be regularly distributed over the plants, thereby causing an equalisation in the flow and concentration of the sap at regular distances from the stem. Examine the soil in every stage of growth at least twice a week, giving a good supply of water when necessary, but be careful not to apply it unless required.

PEACHES AND NECTARINES.—Trees in mid-season and late houses will require frequent and careful attention to thinning and regulating the summer growth, which should be laid in so thin that the foliage has full exposure to light and air. Stop all gross growths, or remove them if likely to interfere with the equalisation of the sap or are likely to overcrowd, endeavouring to maintain an even balance of moderately strong wood that will ripen well, as a well plumped bud, a perfect blossom and a good set of fruit cannot be expected from badly ripened wood. Syringe the trees thoroughly so as to dislodge any spider that may have obtained a footing on the leaves. If this is done effectually twice a day it ought to keep down this and other pests. If not, an insecticide must be brought into requisition promptly. Syringing must of course cease when the fruit begins to ripen, but a good moisture should be maintained by damping available surfaces, and the ventilation should be free, leaving some air on constantly. Inside borders must be well supplied with water passing through a mulching of decayed manure, and outside borders must be well cared for, giving liquid manure if necessary, in any case maintaining a moist condition of the soil, so as to sustain a healthy growth. Early houses that have not been stripped of the roof lights will need all the air possible, and must have the foliage kept clean by syringing or otherwise applying an insecticide. The borders must also be kept in a proper condition as to moisture, and in the case of weakly trees some liquid manure will assist them to form perfect embryo buds and encourage root-action, laying the foundation of a strong bloom and a good set another season. Whatever is contemplated in the matter of renovating the borders, lifting and relaying the roots in fresh material should be made preparation for betimes, so that there may be no delay when the work is taken in hand, as its success depends on its being done carefully, judiciously, and with dispatch.

PLANT HOUSES.

Lilium longiflorum.—This is a charming dwarf-growing Lily, and in many respects is equal to *L. candidum*, if it does not surpass that useful variety for various forms of decoration. It is very cheap, increases rapidly, and can be grown to perfection in much smaller pots than *L. candidum*, which adds much to its value for decoration. Well-developed plants in 4 and 5-inch pots, with from two to four or more of its large pure white trumpet-shaped flowers, are very effective when arranged amongst other plants with its flowers rising well above them. This variety will also flower a second time. Very frequently early-forced plants throw up from the base and commence flowering again in autumn, and will continue to do so more or less during the winter if kept in a temperature not lower than 50°. Our latest batch are just over, and will be plunged outside until the approach of frost, when they will have the protection of a cold frame during the winter. Lilies should never be allowed to become dusty in any state; on the other hand, they must not be saturated with water, or their roots will perish. More Lilies are ruined by drying them off and saturating them with water than from all other causes put together. Those that flowered early may now be repotted if they need it; if not, top-dress with rich material. In any case they should be turned out of their pots and the drainage examined, for good and efficient drainage is one of the principal items in the successful cultivation of these charming bulbs. The variety under notice bears dividing just as it is starting into growth without the slightest injury. The only attention needed after disturbing the roots is to keep the plants close in a frame for a fortnight or three weeks until they commence to root afresh. Those anxious to cultivate this Lily in pots will be able to obtain good bulbs early in the month of October.

Lilium Harrisii.—This is undoubtedly a variety of the preceding, and in some respects slightly superior. It can be readily distinguished from *L. longiflorum* by its more slender growth and deeper shade of green, the leaves being a little longer, not so broad, but more pointed. The flower is longer in the tube and recurves its petals more, but in other respects it is about the same size. It is a few days later coming into flower, and is not more floriferous than *L. longiflorum*. Though the two

FRUIT FORCING.

CUCUMBERS.—The beginning of August and again at the end of that month are good times to make a sowing of Cucumber seed for raising plants to afford a supply of fruit in winter. We have tried almost every kind, but have found none to excel a true stock of Rollisson's Telegraph, possessing, as it does, a good hardy constitution, and producing an abundance of handsome and useful-sized fruit. The seed may be sown singly in 3-inch pots in light soil, and plunged in a frame where there is a little bottom heat. Shift the plants as they require more room at the roots into larger pots until they are planted out, not allowing them to become badly pot-bound. Put small sticks to the plants when sufficiently grown to require supports, and secure with matting, leaving plenty of room in the ligatures for the swelling of the stems. Syringe the plants twice a day, and close from 3 to 4 P.M.; but the time of putting on and taking off air must be regulated by the weather and the circumstances of each particular house as to aspect, construction, and other conditions. The chief thing is to secure a sturdy plant, with its growth thoroughly solidified by plenty of light and the needful ventilation. It is useless to expect a full supply of fruit in winter from plants that are drawn and have flabby foliage, but vigorous healthy plants will give good produce whether grown in pots, boxes, or in beds with hot water or other means of affording bottom heat. Attend to the usual thinning, stopping, and regulating the growths of plants in bearing, encouraging a clean growth, avoiding overcrowding and overcropping. All fruits fit for table should be cut forthwith, and not be allowed to hang

varieties are very similar, both are worth a place in any garden, but when wanted in quantity the last named should be grown on account of its cheapness. *L. Harrisii* requires exactly the same treatment as *L. longiflorum*.

Lilium lancifolium.—The varieties of this useful Lily are well worth growing in quantity for conservatory decoration from July until very late in the season. For flowering early the plants must be grown indoors and receive special treatment, for their natural flowering time is late in the season. By very slight forcing the first season and greenhouse treatment the second they will flower afterwards naturally during the month indicated. Those growing outside should now be divided into two or three batches. One batch should be placed in the greenhouse, another in a sunny position, and a third in a northern aspect, which will insure a good succession. Frequently this variety may be seen when grown outside with its lower foliage turning yellow; and very often the plants cannot be used for decoration on account of their unsightly appearance. In the majority of instances this may be traced to injudicious watering, for it is unnatural for the foliage to turn prematurely yellow. If plants in this condition are examined the soil will be found too wet and the lower roots decaying. If this state of things is allowed to exist the bulbs will decrease in size and eventually die.

Lilium auratum.—After flowering this handsome variety must be tended with great care; it must never be allowed to suffer through an insufficient supply of water, and must never be overwatered, or the roots will rot. Watering should be so conducted that the roots remain fresh and working as long as possible, and even when the flower stems have died down they should be plunged in frames to save watering them and to prevent the soil becoming dry. Plants that have rooted well from the base of the bulbs will, if treated as described after flowering, have a mass of active roots before top growth is visible.

THE BEE-KEEPER.

FRAME HIVES.

THE golden rule of bee-keeping is, Keep all your stocks strong; but this is too often forgotten, and bee-keepers, old and young alike, are apt to have more stocks than they can properly manage, and it cannot be too strongly insisted upon that one or two hives full of bees will be more profitable than the same amount of bees in five or six stocks. The two chief commercial products of bees are swarms and honey, and whichever of these two we find more profitable, we shall have to constantly bear in mind the golden rule; and it is one of the great advantages of the frame system that with a little care we can take advantage of the fact that the frames are interchangeable. Whether or not the standard frame is adopted, every bee-keeper will have a standard frame, for unless his bars fit any of his hives he will not be able to get the full advantage of the frame system.

For instance, he may want to increase his stocks or sell some of them. In the fixed system all he could do was to get a swarm either naturally or artificially, and then feed the bees for ten days or a fortnight till they had filled the hive with comb. As the process of comb-building is very exhaustive, and as no young bees would be hatched to supply the place of those which had died for three weeks at least, unless the swarm was an early one and the honey glut in his district occurred after this three weeks, he would get little or no super honey. In the frame system a different plan is followed. We get a swarm as before, but instead of allowing them to start fresh and be without any brood hatching for three weeks, we give them one or more bars of brood from those hives which can best spare them, and so the swarm is practically a stock.

The stocks from which the brood is taken, having been supplied with whole sheets of foundation, soon make good their temporary check, and this deprivation also helps to prevent them swarming. Again, we need not take so many bees away from the parent stock if we supply the swarm with brood; and a 4-lb. swarm with two bars of sealed brood would be superior to a 6-lb. swarm without any brood. On May 30th we made an artificial swarm which weighed 3½ lbs. and gave them one bar of sealed brood and three bars filled with foundation, and the bees were confined to these four bars and carefully fed. As the foundation was worked out the outside frame was put in the centre of the brood nest,

and another bar with foundation put close to the division board, and so on till all the ten bars were worked out and filled with brood, and on July 6th a crate of sections was put on. Just at the time blossom was coming out, which in this part of Surrey is, together with the Sweet Chestnut, our chief honey harvest.

If we could have spared two more bars of brood doubtless the hive would be even stronger than it is at present, but as the sections are being rapidly worked out there is not much reason to complain.

But the tocsin of warning has been sounded, and the woeful experience of Mr. Woodbury having infected the whole of his apiary with foul brood brought forward against this system. It was the abuse and not the use of this system that caused the ruin of his apiary, and he must have been very much left to himself when he made this mistake. If a bee-keeper does not know whether he has foul brood in any of his hives, and then calmly goes and puts bars from an infected hive into his healthy hives, he has only himself to thank for his mistake, though having so sinned ourselves we are tolerant of others having done the same.

Some years ago, very much against our better judgment, we were persuaded to take two bars out of a very strong healthy hive, put them into a nucleus, and take them to a bee show. In the evening the bars were returned and the queen caged for a day; but the brood had got chilled, foul brood ensued and in a very virulent form, and despite all remedies—salicylic acid, menthol, &c., the bees gradually died. Moral—Save me from my friends.—A SURREYSHIRE BEE KEEPER.

BUYING SURPLUS BEES FOR THE HEATHER—A WORD FOR SKEPS AND EXTRACTED HONEY.

"A LANARKSHIRE BEE-KEEPER," in the issue for July 9th, favourably criticises my scheme of buying surplus bees from the south after the end of their harvest, on purpose to increase my own at the moors, and takes a slight exception to the mode of packing, &c.

When I said in 8 lb. lots in "light" packages, I did not mean small packages; the person who will put them up and send them has sent me many swarms before and knows what he is about, and says that ventilation has not so much to do with success as plenty of room. Still I hold that if two sides of the package is cheese or wire-cloth a smaller one would do as well. The idea of your correspondent to put pieces of board in the box is a valuable one; at the same time, I think pieces of cheese-cloth tacked from side to side and left a clear 2 inches from top and bottom would be better and lighter.

Each package should be made for at least 8 lbs. of bees for two reasons—first, if the stock of bees have been working in supers there will be this quantity, and it would be highly inconvenient to divide them on two stands they had been working on; secondly, as the expenses of transit must be kept down by using large boxes, a greater internal capacity can be had from the same weight of timber. Perhaps the most convenient box to use is what a hundredweight of Tate's cube sugar is put up in, with bottom and lid replaced either with cheese or wire-cloth, with cloth tacked across 4 inches apart. Thus prepared, 12 lbs. of bees will travel safely in it during the hottest weather. The cloth top and bottom should be the sides in travelling.

If only one or two packages are to be sent, the passenger train would be the best means of transit. If this is decided on all the packages should be fastened together, or each one will be booked separately, with a minimum charge on it; but if many are to be sent, 1 lb. or so of candy should be run in the four corners of the box and sent by goods train. The charges by goods train will average 2s. per cwt., while by passenger the charge will be about 14s. The only drawback to "goods" is they are a little longer on the road.

The question of migrating bees has occupied much attention both in this country and America, and I have paid considerable attention to it. Bee-keepers over ten miles from the Heather cannot make much profit on ten or less stocks, while it is impossible for those at a great distance to attempt it owing to the numerous difficulties; but by selling bees from an early to a late district at a price to be mutually agreed on, and the buyer to make what profit he can out of them, makes the plan simple and feasible. If the buyer used the same sized frames as the seller the price might be returned in sealed store combs of Heather honey for wintering; but this I cannot advise, on the one hand because it might spread disease, on the other I should prefer to have all honey stored in supers, when it would command a better price, and only get sufficient honey in the brood combs to winter the reduced number of bees. I mention this because the idea will be sure to suggest itself to many.

I am pleased that your correspondent has given the same or similar idea in the pages of your valuable Journal which I had not seen. I am also pleased to see him speak a good word for the despised skep. Some

prominent members of the British Bee-keepers' Association say they would burn every one in the country. I would not simply give it a place in the apiary, but I would place it first. I do not prefer the large Pettigrew skep nor those little Pagden ones, but one which will throw a 4-lb. swarm. Here is a nut for the "advanced" bee-keepers to crack. Take two stocks in the autumn in equal conditions as regards food (18 lbs. of honey) and bees, one in a skep under a shed or covered with a hackle, and the other in the most improved double-walled-cork-dust-packed hive. The skep will throw a swarm in the spring, and if hived on half sheets of foundation will yield a crop of surplus honey, and itself throw a swarm before the other stock is ready to swarm; thus we have a skep stock extra containing a young queen which will do the same year after year. The problem now is, not how much honey can be got from any one stock regardless of cost, but rather how much profit, and to do this stocks must be kept and wintered in skeps and the swarms put in frame hives, and then during the last harvest united together or sold off to bee-keepers in the Heather districts, extract the honey from the frames, and preserve them ready for the swarms the following summer. A word here about extracted honey. "A. L. B. K." says brood combs spoil the flavour of extracted honey; perhaps so to some palates, though I have not been able to detect any difference, but should not this enhance the value of super honey, which should also be superior to good cheap wholesome extracted honey?—A HALLAMSHIRE BEE-KEEPER.

BEES STINGING WHEN REMOVING SUPERS.

"BASIL" wishes information how to prevent being stung when manipulating bees. There are many things to be observed which the bee-keeper ought to be cognisant of before he can expect to be successful in avoiding being stung when manipulating. The first thing of great importance is not to irritate the bees so that they will attack innocent people and children or animals of any kind. By paying particular attention to this the operator will in a great measure escape, but by donning the bee armour, thereby protecting himself, many others might be severely stung through his rash manipulation.

The nature of bees under all circumstances should be studied, so that the bee-keeper may know by a glance at their movements and sound of the bees the temper they are in, then he will know how to proceed. These things can only be learned by experience, but there are certain rules which must be observed. First, Bees do not sting readily when their honey sacs are full, hence they may be manipulated with safety when the income of honey is great. Second, Empty honey sacs and cold weather have the opposite effect. Third, Be steady in all movements; a very little jar or nervous twitch will send the bees in your face in a second, while a heavy rap or firm shake will keep them quiet. Fourth, Have no loose cloth, such as baggy sleeves, this irritates the bees. Veils when used should be free from this. The most perfect one I have used is the German mask, sold by Messrs. G. Neighbour & Sons. It keeps firm and steady, unlike most others, which are part wire and part cloth. The mask should be lined to suit the head and keep it cool. A good operator on bees generally is most successful without any armour, having his shirt-sleeves rolled up, because, as I have stated, bees dislike loose cloth about the person. I have my vests made with light sleeves buttoning close at the wrists, then a pair of glazed lining cuffs, mounted with elastic at both ends, which keeps all close, the hose drawn over trouser-legs, and the pockets guarded. A pair of indiarubber gloves, sold by the aforesaid firm, is as good armour; but gloves prevent successful manipulation, and bees lose their stings in them, irritating others. Fifth, Never leave a hive once begun until finished, and never two at the same time. Sixth, Always work from behind the hive, and never uncover the whole of the super or crown of the hive at once. Seventh, Never allow any scent about the person, or act so as to irritate the bees. Remember they are the flying bees that attack, so be careful not to cause them to take wing. Seventh, The introduction of foreign varieties make manipulation not only difficult but dangerous, so that many tempers of the kinds have to be studied. My experience with Syrians will be given soon, which seem very partial to having their own way, and dangerous bees if mismanaged. Carniolians, on the other hand, are not only great honey gatherers, but the pure race can be handled with safety under very ill-treatment; while these bees exist timid bee-keepers need not be afraid to keep them. Eighth, Sprinkling bees well with diluted honey or tepid water will quiet them, but this is not required when they are getting honey, and is liable to cause fighting when there is none.

I have just been removing some supers without getting a single sting, and unweiled. It is the first really warm day we have had in July. I removed all wrappings, these being many, perhaps six times more than most people use, and clean supers being the chief causes of pure and well-filled combs. There is as yet no escape of bees, because I cover all supers with a piece of white calico before removing it, and pass a cord between the top of the hive and super to sever, if any, the comb attached to top of hive; but this is so rare when the hives are wrought as I have advised, that as a rule they may be lifted off without this precaution. For regularity and finish of comb I cannot conceive why people will employ separators in their supers. When the cord has been passed through (my cords are smeared a little with crude carbolic acid of the full strength) I turn up the calico, exposing one opening only, insert a sheet, then repeat till all are done. Whether the weather is cold or warm by the time the papers are withdrawn the super is emptied of bees and ready for lifting. An empty super is at hand to take the place of the one removed, and covered until either filled or the bees have settled and retreated down, when all should be removed and covered for winter.

Frames should be operated in a similar fashion. Should the bees by any unavoidable cause become irritated smear the entrance with carbolic acid, and frequent them often, so that they may be reconciled. Never leave a hive unsubdued or serious consequences will follow. If my suggestions fail close the hive entirely and drum on it for some time. They will fill their sacs and become docile. Let all manipulations be done quickly, and never expose a hive long. By attending to these hints and studying the natures of the different sorts of bees success is certain.

Useful hints weekly lose much of their value owing to our variable climate. It is far better to read and note carefully the general directions given in this Journal, the mother of all others; then, as the season comes round, the greatest tyro cannot fail to know what to do. I will not fail to give useful hints weekly or monthly, but just as I make up my mind to do something to or for my bees the weather changes, and I have to change my plans. Useful hints given regularly and acted upon in that fashion would in all likelihood lead beginners into a difficulty. Answers to correspondents would, I think, do more good and be more satisfactory. Here are several hints that no one will be misled by—viz., to those who find moths an enemy. Set traps about the hive. Match boxes filled with some comb will attract the moths; eggs will be laid in them, which can be destroyed at will. Drone comb in the centre of the hive causes the queen to be deposed sometimes in spring, and is a serious drawback to have many drones coming forward at a time when worker bees are most needed. Remove all such surplus drone comb and have the space filled with worker comb at once. Wherever the combs are black, remove these and insert foundation and get white comb made. Bees are healthier and breed better in new combs than in old ones. All hives not yet provided with a young queen should have one without delay. Be sure that all hives are well provided for, sufficient to last them till May, covering carefully now, and molest them no more until the spring, when the floors require cleaning. Where the solid floor is in use a ventilating one should take its place.

I used to keep the front of my hives clear of all vegetation. Neglect has allowed the Arabis to cover close up to some. It is a capital door mat for bees, always of a warmish and rough nature; the bees can rest on and rise easily from it. Those hives intended for the Heather, if heavy, should have the weightiest combs removed and filled with brood combs from other hives (intended for that purpose) put in their place. Surplus bees should be joined so as to form strong stocks. Thorough ventilation should be provided.—A LANARKSHIRE BEE-KEEPER.

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Propagating Echeverias (C. T. H.).—Both these plants and Pachyphytons, also Kleinias, are readily increased from leaves. The larger of these should be taken off quite close to the stem, and left an hour or two for the wounds to dry, then inserted as lightly as possible in a layer of sand spread over free well-drained soil in pots and boxes. It is well to water this before inserting the leaves, then, when the surface has dried somewhat but still damp, press the base of each in the sand, but very slightly, standing the pots or boxes on a shelf in a greenhouse. In dull weather no water will be needed, but it must be given occasionally in hot dry weather. There is greater danger, however, in over than in under watering, and after giving water you may sprinkle on some dry sand. If rightly managed a bud will form near the base of each leaf, which will develop into a plant. In dull weather, and where the house is slightly damp, we have seen hundreds of young plants raised by resting the ends of the leaves on the soil, and in no case must they be inserted deeply, or they will decay. You had better try both methods, and with care in watering you will succeed in your object. The present is the time for the work.

Supporting Tuberous Begonias (C. D.).—We are glad to learn our advice has proved so satisfactory; but credit rests with yourself for carrying out our instructions intelligently, as exactly the same information has been given to others, who have failed in their object. The main point now the pots are filled with roots is never to let the soil get dry before water is given, and liquid manure, of the colour of ale, will give all the support that is needed. It may be made from cow dung or sheep dung mixed and given at once; or of soot, a portion being tied up in a piece of canvas, and

immersed in a vessel of water till the latter is coloured as indicated. Twice or thrice a week will probably be often enough to give liquid manure. Syringe amongst the pots frequently in hot weather, and keep the base on which they stand moist.

Bertolonia Van Houttei (*Constant Reader*).—The beautiful ornamental-foliaged plant requires to be grown in a case or under a glass shade in a shaded position in a warm stove to bring out its glistening colours. Shade, heat, and moisture are the chief requirements. It grows freely in a compost of fibry peat, leaf mould, and sand, but will not grow freely in the sun or a dry atmosphere. Caladiums also require heat and moisture, with shade from bright sun, the strong growers luxuriating in a rough compost of loam, decayed manure, and crushed charcoal, the pretty little *C. argyrites* preferring an admixture of peat. No stove plants are more easy to grow than Caladiums, but they must have plenty of moisture at the roots and a moist genial atmosphere.

Ammonia for Vines (*F. J.*).—Time after time it has been stated in "Work for the Week," in articles, and in answers in this column, that ammonia can be beneficially applied to Vines in the form of strong guano water sprinkled in the house and placed in troughs on the pipes. We are most willing to advise you at all times, but have often observed you apply for information that has been given a few weeks before, and consequently a few weeks too late for your deriving full benefit from the replies that we can give on a subject. Mix one or two ounces of guano in a gallon of water, and make every available plant of the house wet with it every evening when you close the sashes. You cannot very well use too much of this in hot weather until the Grapes colour, but open the lights an inch or two at the top before nightfall, and the front lights also on sultry nights, and leave them open, giving more air very early in the morning in advance of the rising temperature—that is to prevent the heat rushing up suddenly, then having to throw open the ventilators to reduce it. This latter practice, which is much too common, is the cause of many failures. The night temperature you name is quite 5° higher than is recommended in the Journal; in fact 10°, and we fear you do not read attentively. If the thermometer registers 65° the first thing in the morning the house will be quite warm enough, but there must always be a free circulation of air. Shallow vessels may still be kept filled with water in hot weather, but the ammonia applications had better cease when the Grapes are fairly colouring and before they are ripe. As has frequently been stated, this should commence when the berries are about stoning.

Budding Briars (*J. B.*).—If you cut the strong shoots clean away you will check the flow of sap so seriously that you will probably entirely fail in your object. We should not shorten the growths at all, but simply remove the soil from the stems, give a good watering, insert the buds at once, bind with matting or worsted, and cover any roots that may be exposed with soil, but not the inserted buds. It is very important that the shoots from which the buds are taken be kept moist, as if the leaves wither and the bark shrinks even slightly the buds will not grow, and they should be inserted as quickly as possible when taken from the stems. We should not shorten the shoots after the insertion of the buds—at least, not until they are pruned in winter. By shortening the growths after the buds are established they are often made to push just before winter and be killed. They are better in a dormant state till spring, and are then sure to push strongly, and most of them produce fine blooms. The more growths the stocks make this summer the greater is the root-action for supporting the Roses next year. Beauty of Hebron Potato is ready for taking up when the leaves turn yellow.

Vinery for Market Purposes (*W.*).—The best description of house is a span-roof about 20 feet in width, either with or without glass sides. The latter is the cheapest, but we prefer the houses with about 2 feet 6 inches of brickwork, and 3 feet of glass at the sides. The wall admits of slope for shutter or other covering of the outside borders, which is necessary when late Grapes or early-forced ones are grown, and the side lights admit of ventilation. The pitch of roof we should have at an angle of about 65°, or calculating for half the width, 7 feet 6 inches being the height of the ridge above the eaves, so that with the sides as above indicated the house will be 13 feet in the centre from the floor line to the ridge. The rafters we should have 7 inches by 3 inches, and the sash-bars 3 inches by 1½ inch, two sash-bars between each rafter, fixed so as to take squares about 13 inches wide. You will need lights 2 inches thick on both sides of the ridge about 2 feet wide, and opening the full length by lever movement, and similar means of ventilation on both sides. The glass should be 21 oz. thirds. You will need iron tie-rods to every alternate rafter. If you want plainer houses, read what will be published about Mr. Ladds' in an early issue. They are both lower and flatter than that above described. The pitch of a house may with advantage be greater in dull northerly districts than in the south, and you do not state from whence you write. The house recommended is for late Grapes mainly, or those that have to hang a considerable time after ripening.

Mushroom Culture (*Cryptogami*).—Sphagnum can be procured of most nurserymen; but it is of no use for mixing with straw to make a Mushroom bed. As you cannot procure droppings in other than small quantities, they should, as collected, be placed in a shed or other place secure from wet, spreading out thinly, and turning over occasionally so as to keep it from becoming stale. When you have collected sufficient droppings throw all together into a heap, mixing the fresh with the old, and when it has become warm form into a bed. You could not do better than procure "Mushrooms for the Million," which gives minute directions for growing Mushrooms under a great variety of circumstances. It may be had from our office for 1s. 2d. post free.

Figs Falling Off (*J. F. L.*).—The cause of the Figs falling is undoubtedly owing to the immaturity of the wood, which may be due to the roots running riot in the border, which keeps up growth until a late period, and the wood consequently does not ripen to the point. The shoots also may be crowded, so as not to admit light and air, hence wood is not solidified as made, as is evidenced by the growth, which is long-jointed. We should confine the roots to the pots, giving them a shift into larger in autumn, or it may be done now, draining well, and using good loam with a sixth of old mortar rubbish intermixed. Pot hard, the harder the better, then cut or tie down the shoots, stopping the side growths, keeping them rather thin so as to

admit air to the interior, and well exposed to the light. Feeding is best done on the surface with a mulch of turf and well-rotted manure, with liquid manure as necessary. If the trees are much rooted from the pots the roots should be cut through gradually so as not to give a too severe check. The crop also appears heavy. The fruit sent is unfertilised. The variety appears to be the White Ischia.

Address (*J. F.*).—Messrs. Hooper & Co., Florists, Central Avenue, Covent Garden, London, W.C.

Vines Unhealthy (*H. C.*).—Your Vines are in a deplorable state, but we see no evidence of the presence of the phylloxera. They shall be further examined and a fuller reply given in a future issue.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should contain spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once. (*J. R.*).—1, *Gnaphalium uliginosum*; 2, *Gnaphalium luteo-album*; 3, *Filago spathulata*; 4, *Erigeron acre*; 5, *Centaurea montana alba*; 6, *Sisymbrium pannonicum*. (*Mater*).—Our conditions, which are regularly published, stipulate for six plants only at one time, and we cannot undertake to name more; also, Ferns sent for naming should have spores on the fronds. 5, *Begonia metallica*; 8, *Lonicera aurea reticulata*; 9, *Euonymus radicans*; 10, *Campanula*; specimen insufficient; if rather tall-growing it is *C. grandis*. 11, *Tanacetum vulgare* (*Tansy*); 13, *Aconitum versicolor*. (*Bob*).—3, *Blechnum spicant*; 4, *Asplenium trichomanes*; 5, *Asplenium Adiantum nigrum*; 7, *Polypodium Phegopteris*; 9, *Polystichum angulare*; 12, *Cystopteris fragilis*. (*W. P.*).—*Acropera concolor*. (*C. H. Stephens*).—1, *Physalis Alkekengi*; 2, *Hemerocallis fulva*; 3, *Phacelia tanacetifolia*; 4, *Liadelophia spectabilis*; 5, *Aconitum paniculatum*; 6, *Argemone sulphurea*.

A Straw Skep as Super (*Reader*).—By putting a skep on the top of the stock you have simply supered it, and if it has not swarmed in your absence the super should be filled with pure comb and honey, which should be removed by passing a cord between it and hive, then drive out the bees in the usual manner, rapping gently when driving, as the combs will be soft. The under hive, if of sufficient weight, may be arranged for winter. If not heavy enough syrup should be given next month to bring it up to a proper weight, which ought to be from 30 to 40 lbs., exclusive of hive and board. If the hive has its original queen it would give more satisfaction next year. If she was deposed and a young one joined, or as it is early in the season, a young one raised in hive now would be certain to mate; but as queens are often lost when on the wedding tour, a nucleus should be formed by driving a few bees on the tenth day into a small box or hive, and insert beside them a piece of comb containing a queen cell. This would give an extra queen in case of casualty, or if not required, could be fed up and kept over till spring, when she could be easily disposed of.

COVENT GARDEN MARKET.—JULY 29TH.

THE CLERGYMAN'S FARM.

(Continued from page 80.)

For intrinsic value and general utility Oats may be regarded as even more important than Wheat upon the clergyman's farm. As whole or bruised corn it is indispensable

for horses, cattle, and sheep, and we have no other cereal equal to it for such purposes. Then, too, as oatmeal for pigs and poultry it is of almost equal value, and a full supply of this corn can always be home-grown, which is a point to be remembered. Before all things let a farm be self-supporting, and let its produce be turned to the best account for the wants of the household and farmyard. Insist upon a fair, or rather sufficient, proportion of land being devoted to Oat culture. Do not pay much heed to talk about four-course shifts, or to the popular fallacy that Oats, or indeed any farm crops, may not be grown two years in succession upon the same piece of land; but do take care to learn exactly how to cultivate the land, especially as regards the right use of manures upon it, and then you may go on year after year sowing Oats, Wheat, or Barley upon the same land—aye, and expect full crops too. In proof of the soundness of our teaching we might adduce many an instance, but it may suffice to say that the Winter Oats now being harvested is the third crop of Oats in succession from the same piece of land, and it is by far the finest of the three. We have found Maize occasionally being used as a substitute for Oats; but apart from our decided objection to the purchase of corn for home consumption, we know that one hundred parts each of Oats and oatmeal contain a larger per-centage of the most important nourishing constituents—albuminoides, carbohydrates, and fats—than equal quantities of Maize and Maize meal, and in Oat straw we have a nutritive article of food for sheep and cattle.

An average or ordinary crop of Oats yields forty-five bushels per acre; under high culture it is so much more as to afford a valuable lesson upon the profit of high farming. No better illustration of the condition of land can be had than from a crop of Oats. Straw and corn ripe for harvest may be seen at heights ranging from 6 inches up to 6 feet, according to the condition of the soil in which it was grown. In making a calculation when the land is allotted into due proportions for the various crops, it is well to take the yield of an ordinary crop for our base, and, at any rate, to make sure that our system of culture will afford equal if not superior results. In doing this we have to consider to what our requirements for a year amount. The size and age of animals must all be taken into account, and a fair margin allowed for any extraordinary demand which may arise. There need be no feeling of anxiety about any surplus, for good Oats are always a marketable commodity, first-class home-grown Oats often selling for 10s. per quarter more than inferior foreign samples. Grey Winter Oats should be sown in September or October, and Black Tartarians as early in spring as the condition of the soil admits of. For soil of light or medium quality preference is given to Winter Oats, for the important reasons that they are what may be termed a safe crop, the germination of the seed being quick and certain in the warm moist soil, the strong early growth affording a valuable supply of green food for sheep in spring, and the corn being ripe for harvest during the present month. In the culture of Spring Oats there is much more uncertainty. We cannot always have the soil in good tilth for early sowing, and when the soil is late there is risk of having small light corn and short straw, and the harvest is much later than that of the Winter Oats. Especial care is taken to have corn and straw well ripened before it is taken to the rick to avoid all risk of musty straw, which is certainly unpalatable for the cattle to eat. It is for this reason that we have ceased to bind up Oats into sheaves, and we find it answer much best to mow them into swathes, which, if the crop be a heavy one, may require turning once, and then to collect and cart them loosely to the rick. A heavy crop of Oats cut and bound into sheaves is frequently carted with so much unripe straw in the middle of each sheaf so as to cause violent heating and subsequent mildew in the rick; or if the weather proves very wet between the reaping and carting the sheaves may become so wet that the bonds must be unfastened and the sheaves opened to be dried by sun and wind.

It is not our intention to give exhaustive details of culture in these articles, but rather to furnish practical hints to prompt and assist in the formation of plans which may be brought to maturity by Michaelmas, when the farming year ends and the work of another year of ploughing, sowing, reaping, and harvesting again begins. Oats have been given a prominent position for the reasons mentioned, and that timely attention may be given to the preparation of the seed bed. We have a field of twelve acres which has been a bare fallow this year against our wish; but we could not well prevent it, for when the farm was taken in hand some three months ago we found thirty acres of bare fallow upon it. All that was possible has been done to remedy this bad practice, and we have managed to have eighteen acres cleaned of foul weeds and sown—a small portion with roots, and the remainder with White Mustard to be ploughed in. The bare twelve acres is being ploughed for the fourth time, and we have decided that it shall be sown with Winter Oats, for which an autumn and spring dressing of home-mixed artificial manures will be used.

WORK ON THE HOME FARM.

On two poor farms we have a second growth of Red Clover that in neither instance will be sufficiently strong for mowing. About sixty old ewes drafted from the breeding flock have been sent to one of these farms to be folded upon the Clover, the folds to be so small as to ensure a prompt clearance of the Clover, and a tolerably rich dressing of manure, to which a pound of oilcake a day to each sheep will contribute materially. The folds will be so managed that ploughing may follow closely. A similar number of old ewes will be purchased for a similar purpose upon the other farm. It was our original intention to purchase some more lambs for folding, but upon consideration, and bearing in mind the poverty of the soil, we decided to give preference to old sheep, and shall be content if when they are all sold we are able to clear expenses, looking for our profit in the soil. Our 400 home-bred lambs have since the weaning been divided into two flocks and sent to two outlying farms. All the best ewe lambs will eventually go into the breeding flock, and the remainder will be sold in spring as fat hoggets. Mixed crushed corn at the rate of half a pound a head daily should be given these lambs, but as we cannot spare it them, they are having the same quantity of Waterloo cake, which from the mixture of wholesome nutritive food contained in it is admirably adapted for lambs. It is our intention to put all the ewe lambs to the tup in November, and in view of this they are now having cake with the other lambs, so as to render them as strong and forward in growth as possible by that time. The lambs were all dipped soon after the weaning, and the ewes have now also been dipped. We always wait about a month or six weeks after the shearing before dipping to allow time for any wounds caused by careless clipping to heal. All sheep suffering from foot rot have been separated from the others, and till the dipping was done especial watch was kept against attacks of fly. Water is taken daily to any of the sheep having no pond or stream in the pasture, for it is a cruel thing to keep them without water in hot sultry weather. Do not forget our advice to fold sheep upon new permanent pastures. For the first two years sheep should never be suffered to roam at will upon them, or many of the grasses will suffer either from being eaten too closely or being let run to seed. Pass sheep over the pasture in folds only two or three times, according to the growth, giving them corn or cake each time, and the grass will be eaten fairly and be well manured at the same time.

REMARKS.

19th.—Cloudy; heavy showers in afternoon.
20th.—Fine, but not bright.
21st.—Cloudy morning; fine afternoon, with a little sunshine.
22nd.—Beautifully fine.
23rd.—Fine summer day.
24th.—Fine bright morning, and nearly cloudless day.
25th.—Fine and hot, but slightly hazy.
A week of fine summer weather. Rain much below the average, the total for the past six weeks being only 1 inch.—G. J. SYMONS.

CHEAP AND EFFECTIVE BORDER FLOWERS.

IT is not generally known that annual Candytuft in a small state will pass the winter safely under the shelter of a wall, or even in open borders if the weather does not prove too severe. Plants raised from seed sown now and again towards the end of August will prove most useful for cutting and general garden decoration early in the season and before border plants in flower are plentiful. Plants sown in early spring form a capital succession to those raised from seed sown at the time advised. Those that stand the winter often have their foliage browned, but as soon as the weather is favourable they start freely into growth and branch wonderfully, forming heads of bloom in many instances 2 feet across on stems varying from 6 to 9 inches high. The hybrid forms of Candytuft, which are generally sown in spring and looked upon as tender annuals, are among the most beautiful border plants that can be grown for flowering early in the season. This year our plants were coming into flower just as the late-flowering Narcissi were over and in full beauty with the Pyrethrums. Many who saw them were surprised, and could scarcely believe that it was the result of seed sown late in summer, but thought them some new hardy variety.

The treatment is very simple. The seed should be sown outside in small beds in an open position, as well as a quantity scattered about in the borders, where the seedlings can be thinned out and left to take their chance. Those sown in beds as soon as large enough should be pricked out singly 3 or 4 inches apart in a sheltered position, where they can remain for the winter. It is well to let them attain a good size before planting in their winter quarters, as the lifting checks them and assists in promoting firm woody growth. The soil in which they are transplanted should be made moderately firm, and in the spring remove with a trowel, preserving all the roots possible, to the position in which they are desired to flower. Those that pass the winter safely in the open borders will come first into flower. If the weather prove severe and kill them the cost of seed and labour is so trifling that it is scarcely worth naming, but if they live they abundantly repay for the trouble they have given. To insure their safety during the winter it is a good plan to place a board 8 or 10 inches deep round the portion of ground on which they are planted, with a few thin laths nailed across, so that mats can be thrown over them during sharp frosts. Young plants have passed the two last winters safely in open borders without the slightest protection.

Seed of the various colours of Intermediate, East Lothian, and Brompton Stocks should be sown in shallow drills on a border without delay, and plants will be raised that will render beds and borders sweet and attractive from the middle or end of May, according to the season, to the end of the present month; in fact, the East Lothian varieties will flower more or less the whole of the season. Some plants that were very small in spring made a most vigorous

growth after they were transplanted, and are now a complete mass of bloom, and will continue flowering until the approach of frost. The treatment for winter is simple. As soon as the plants are large enough to be handled they are pricked out 5 inches apart, where they will be sheltered from north winds and where snow will not fall on them off the roofs of houses or buildings. They are protected during very sharp weather with mats, boards being placed round them the same as advised for Candytuft. Care is taken when first transplanting to place them where the ground will not be wanted for any other purpose in early spring. It should be made firm, but not rich, the object being to induce slow growth, so that the plants will be sturdy, in which condition they pass the winter much better than if rapid growth is encouraged in the autumn. Towards the end of March every alternate row is carefully lifted with a trowel during showery weather, and every other plant from the rows remaining, thus leaving those upon the ground exactly 10 inches apart, the others being planted in enriched soil. The plants left will come first into flower, and consist of Intermediate varieties, the whole of the other sorts being transplanted. Those left upon the unmanured border are liberally supplied with liquid manure during the spring. All who have not grown Stocks for yielding a bountiful supply of fragrant flowers for cutting early in the season will not be disappointed by giving them a trial if the simple directions given are followed.

If the seed of *Antirrhinums* is sown in spring, even in heat, and the seedlings pricked into pans or boxes and planted out as soon as large enough, they will not flower freely before the end of August, and often later. This is very well for an autumn supply, and is a system we generally practise. But to have plants flowering during the month of June they must either be raised from cuttings inserted at once or from seed sown either in a box or outside. If sown outside it may be scattered on the surface of fine soil and merely raked in, no other covering being necessary, well watered and shaded with a mat until germination takes place. When large enough, a number of the plants should be inserted in open beds and borders where they are intended to flower. The majority will probably survive the winter and commence rapid growth in early spring, forming good-sized bushes before plants raised in spring are ready for planting out.

In case those fail in exposed positions a number should be planted at the foot of walls, where they will be slightly sheltered from severe frost and cutting winds, the latter generally doing more harm than frost. Since such good varieties can be raised from seed it is scarcely worth while troubling to raise plants by means of cuttings, except in the case of any good white or other distinct colour that may be required for a special purpose. Unfortunately, it generally happens that plants which flower freely, and especially moderately early in the season, do not produce good cuttings before the middle of September, and these are too late for early flowering. Cuttings taken at that season are subjected to cool frame treatment during winter, the same as *Calceolarias*, *Pentstemons*, and other similar plants. Cuttings inserted now receive the same treatment as seedlings after they are once well rooted.

Sweet Williams (*Dianthus barbatus*) are generally sown in spring, grown through the summer for flowering the following season, and by this system strong plants can be produced. The only objection to sowing in spring is the labour in pricking out the seedlings at a busy season of the year when various other things require immediate attention. It therefore not unfrequently happens that such plants are often left in the seed bed for a long time after they ought to have been transplanted, and when crippled by crowding they rarely develop satisfactorily afterwards. If seed is sown now the young plants can be pricked out about 4 inches apart as soon as they are large enough, and being perfectly hardy there is no fear of their not passing the winter safely.

By sowing now the labour necessary is done during autumn instead of the spring, and by placing the plants sufficiently far apart at first they have room to develop without crowding until a favourable opportunity presents itself for transplanting them to quarters in which they are to flower. They can be pricked closer together if room is an object, and every other plant removed in spring. The plants we raised were so treated, a portion early in the season being transplanted amongst shrubs, and they are now from 6 to 9 inches over, some more, while the bed they occupied is fully furnished for removal in early autumn into mixed beds and borders.

The varieties of *Dianthus chinensis* should also be sown now. The various forms of the Heddewigi section are remarkable for the diversity and brilliancy of their colours, and are most useful for cutting as well as decoration in beds and borders. These if sown in spring will flower the same season, but are later than the plants raised from seed sown at the present time. These should be treated the same as Sweet Williams, only they do not require so much room when they are pricked out from the seed bed. Though not quite hardy they will stand ordinary winters safely, and being so beautiful they are well worth trying. Cuttings should now be taken from these, and any other forms of *Dianthus* that it is necessary to preserve by this means. They root quickly if dibbled into sandy soil in a shady place, covered with a handlight, and kept close until they are rooted. These can be planted out afterwards, and treated the same as seedlings. They must be protected in some way from the ravages of slugs. Some of the choice forms of *Dianthus* are wintered in small pots in a cold frame, and planted out in spring.

Gaillardias are very showy border plants, but when sown in spring even in heat they are late before they commence flowering. Cuttings of the brilliant *G. grandiflora* should be rooted at once the same as recommended for *Dianthus*, potting them afterwards and wintering them in a cold frame. Seed may also be sown now, and when the plants are large enough potted singly and treated the same as those raised by cuttings. Planted outside early in spring Gaillardias commence flowering early in the season, and if in good soil they continue until cut off by frost. *G. picta Lorenziana* sown in the spring does not flower before August, but sown in autumn, wintered in small pots, and shifted in spring, they rapidly attain a flowering size. It is a quick grower, and produces its flowers, which are admirably adapted for cutting, most freely in succession until cut off by severe frost. This variety is more difficult to winter than *grandiflora*, as it appears liable to damp off. Attention is needed to prevent this, but it can be accomplished by keeping the plants moderately dry and ventilating the frame judiciously. It is, however, worth a place on the greenhouse shelf, or the shelf of any cool house where plenty of air can be given.

Enothera Lamarckiana should also be sown at the present time, for, although of no service for cutting, good groups in the garden are highly effective. In moderately good soil the plants attain a height of 6 or 7 feet, and branch abundantly. A dozen or more plants in a group planted about 18 inches or 2 feet apart at the front of tall shrubs are very effective from the end of July until the close of the season. When sown in spring some of the plants will flower, but not all; but even those that do flower will not be nearly so fine as those raised from seed sown now. The seed being fine it should be sown on the surface without being covered, merely being kept moist until germination takes place. It should be sown thinly, so that the plants can remain on the seed-bed until spring before they are planted in their flowering quarters.

Foxgloves are amongst the most beautiful of biennials that can be grown for the same purpose, and to have strong plants capable of throwing spikes 7 or 8 feet high seed should be sown at once. Flowering plants for the following year will be produced from seed sown in spring, but they do not attain such a large size as if sown the previous season. Good strains with beautifully spotted flowers can now be

obtained, and groups of them are most telling in garden decoration. This year we have the vacant ground in a large clump of young Hollies planted with them, and the majority are 7 feet high, many of them more, and they have been greatly admired by all who have seen them.—W. BARDNEY.

THE HISTORY OF THE CHRYSANTHEMUM.

(Continued from page 62.)

THUS far we have hurriedly glanced at the early history of the Chrysanthemum in England and France, and now a new era was destined to be opened.

Leaving for a while the French, in order to keep as far as we are able the dates running consecutively, we will see what was being done in another part of the world.

The year 1836 was a momentous one for the Chrysanthemum, for in addition to Captain Bernet's new proceeding and the commencement of Mons. Lebois' labours an amateur in Jersey turned his attention to the raising of seedlings, and it was from this time that a marked improvement in the varieties took place. This amateur was so extraordinarily fortunate in his culture that he raised upwards of five hundred seedlings, which he sold to Mr. Chandler of the Vauxhall Nursery, a good number of which were tolerably well known twenty years ago.

According to a correspondent of Mr. Burbidge the raiser of the first seedling Chrysanthemums in the Channel Islands was a baker, who had trained his plants to a wall behind his oven. This may perhaps be the same person alluded to above, although no names are mentioned in either case. Other growers were not long in following, some of whom, such as Clark, Davis, Pethers, Smith, and Wolsey, raised a large proportion of our still well-known incurved, reflexed, and large Anemone varieties, while in later years Mr. Downton and Major Carey have also contributed some very favourite sorts.

It may be observed that in Mr. Salter's catalogue out of those varieties to which he has appended the raiser's name more than half appear to be of Jersey or Guernsey origin, and it is difficult to reconcile that fact with a statement made by one of Mr. Salter's contemporaries that he was chiefly dependent on Italian seed for the many new varieties it was his good fortune to send into the market. Be that as it may, and having due regard to the statements of Captain Bernet, Mons. Lebois, and Mr. Burbidge's correspondent, who gives some interesting facts connected with the early raisers in the Channel Islands, there seems to be ample evidence in favour of a distinct assertion to the contrary, and that the greater part of the varieties distributed by Mr. Salter which were not of his own raising were really the products of the French and Channel Island growers.

There is no doubt that Mr. Salter knew far more of the doings of the foreign growers than anyone else in his day, and though he acknowledges having dealings with the French and other growers, and says he was personally acquainted with many of them named already in this work, not a word is mentioned by him on the subject of Italian seed or Italian growers, and certainly at this date no one can point to a single variety of the Chrysanthemum of Italian origin grown in this country. His work "*The Chrysanthemum; its History and Culture*," published just twenty years ago, is, notwithstanding its age, a book that should be on the shelves of every lover of this plant. No treatise on our delightful autumn favourite would be complete without some reference to it, and the author must also acknowledge his indebtedness to that authority for much that has hitherto been placed before the reader. In this work we learn that, finding the climate of France more suitable for the purpose of raising seedling Chrysanthemums, Mr. Salter went to Versailles in 1838 for the purpose of establishing a nursery to enable him to accomplish his desire. He imported from England most of the Jersey and Norfolk seedlings, to which collection he added 250 of the best French sorts, so that in 1840 the number of varieties he had in cultivation amounted to between 300 and 400. On looking over the list for that year he says it did not appear that there were more than thirty varieties with incurved petals or florets, and that nearly all of these were obtained since 1830.

As he gives a plate copied from the "*Botanical Magazine*" of the first variety which bloomed in this country (the old Purple), it seems that up to that time the varieties were all of the same style of loose, open, ragged-petalled flowers as Messrs. Colvill's variety; and, while referring to Mr. Haworth's classification, which was drawn up in 1834, comprising the fifty-three varieties then known and divided into the following six sections—viz., the *Ranunculus* form reflexed petals, the *Ranunculus* form fringed petals, the *Anemone* form with yellow disc, the *Marigold* form and size, the tasselled form with narrow petals and pendant blooms, the quilled form—he says that the variety then most highly esteemed with incurved petals was probably unknown, and that to that classification might also be added

four other sections—viz., the incurved form with broad petals, the Pompon-Ranunculus form, the Pompon-Anemone form, and the Matricaroides or Feverfew form and size.

Since then, however, owing to the advent of the Japanese and Japanese Anemones it is felt that some further system of classification should be adopted, and several suggestions have been made to effectuate it.

Five years after he was established in France Mr. Salter raised his first seedlings in the nursery at Versailles, a place called by Voltaire "l'abîme des dépenses," with which one can scarcely imagine Mr. Salter agreed as far as he was concerned. In 1844 he sent out Annie Salter (still cultivated by growers of the reflexed section), Madame Poggi, and Queen of the Yellows. In 1846 Cyclops, Fleur de Marie, the Anemone variety, and Nancy de Sermet. In 1847 Queen of England followed, so that this leading incurved exhibition favourite will shortly be forty years old.

About this time another new chapter in the history of the Chrysanthemum opened. In the early part of this work an account has already been given of the introduction of the *C. indicum*, the type of what is now called the Pompon, and that it was growing in this country as long ago as 1764, only to have vanished entirely. There were sixty years afterwards other new comers of the same species, notably the double yellow and double white Indian Chrysanthemums, both introduced by Mr. Parks, which soon shared a similar fate, the most important reason for this being in all probability the insignificant size of their blossoms compared with the Chinese varieties accompanying them. It is excusable perhaps to lay some little stress on this, as many growers seem to be of the opinion that the large-flowering varieties were first known in this country in 1764, whereas it was the small-flowering species that first appeared among us, then it was lost and followed by the Chinese Chrysanthemum a quarter of a century later on.

Upon the conclusion of the war with China in 1842 peace was signed at Nankin, and it was stipulated in the treaty that Canton, Amoy, Foochoo-foa, Ningpo, and Shanghai were to be thrown open to the British, that Hong-Kong was to be permanently retained by us, whilst the Island of Chusan was to be held as a guarantee that the provisions of the treaty were observed by the Chinese. The Horticultural Society of London taking advantage of this, and believing that there was a wide field of botanical research open to them in those districts, despatched Mr. Robert Fortune, then the Superintendent of the hothouse department in the Society's Garden, to China in the spring of 1843 for the purpose of collecting rare or unknown plants. On his return in 1846, after an absence of three years and a quarter, and having visited all the places above mentioned, he brought home with other horticultural curiosities two small-flowering varieties known as the Chusan Daisy and Chinese Minimum. These were according to Mr. Salter similar in size to those called Liliputians, and were probably varieties from the true *C. indicum* of Linnaeus, and it is a rather strange coincidence that the first variety, or Miller's *Matricaria indica*, should have come from Ningpo, which, although on the mainland, is but forty miles from Chusan. These two small-flowering varieties, he says, were at once introduced into the Versailles Nursery soon to become favourites with the French. Chinese Minimum was a dark double flower, and produced but little seed, while the other with its Daisy-like semi-double flowers seeded freely the first year, the seedlings being more double than the original, and from their compactness and resemblance to a rosette received the name of Pompon.

Mr. Fortune and Mr. Salter both say, and presumably with the greatest exactitude, that from these two varieties all the Pompoms now in cultivation have sprung. But there seems to be some doubt, or more accurately speaking a distinctly opposite assertion made by one of the principal Pompon growers in France, upon which the author can make no comment, beyond a reproduction of the statement that it is contradictory to what in England has always been generally accepted as the fact.

Before doing so it may be pointed out that Mr. Burbidge tells us that the Chusan Daisy was propagated by the Horticultural Society, and distributed among its members, and from some of these members it was sent to the enthusiastic Chrysanthemum grower Mons. Lebois, and that he having seeded it raised a great many good varieties, which got into Mr. Salter's hands. Now, Mons. Lebois, in his admirable little work published many years ago, gives an account entirely different, and it will be best to allow him to tell it in his own language. He says:—"One more word on my seedlings of 1847. I cannot omit an incident that opened a new era in the history of my favourite plant. Having sown as usual only seeds of large-flowering Chrysanthemums, one of my seedling plants produced a Pompon flower, a hybrid of the most graceful effect, which I called Circe. The same year Messrs. Bonamy Brothers sent to Mons. Pepin of the Jardin des Plantes a few specimens analogous to my Circe, but their flowers, rather smaller, were not quite double. I therefore from 1847 was

allowed to hope to be the means of introducing to the horticultural world a race of entirely new Chrysanthemums greatly desired by lovers of that flower."

There is a Pompon of the name of Circe in Mr. Burbidge's list, but no description or raiser's name follows it, and if Mons. Lebois' statement is unimpeachable it will naturally raise a point as to whether all the Pompoms, and especially those of French origin, are descended from the two varieties Mr. Fortune introduced, a question that must be elucidated and decided by an abler and better authority than the writer of this work.

It is a pity Mons. Lebois' work bears no date, but it seems likely that it was published somewhere about the year 1853. He makes no reference to Mr. Fortune, nor to his having received plants of the Pompon from members of the Horticultural Society, and his statement is given simply for what the reader may think it is worth.

Many of us have been of the opinion that the summer and early-blooming varieties are new to the Chrysanthemum grower, but such is by no means the case. Up to the year 1850 many lovers of this flower had expressed their regret at the inability of the raisers, who had almost conquered every difficulty connected with the Chrysanthemum, to obtain varieties which should bloom in the summer and early autumn months, and at the same period great hopes were indulged in that the Chinese and Pompon varieties should be the means of maintaining a brilliant and effective display of colour in the gardens. Mr. Salter and Dr. Denny both ardently longed for a consummation of this idea, and the beds at the nursery in William Street, Hammer-smith, where the former having returned from France a year or two before had established himself, and where he carried on his business, were always planted with numerous Chrysanthemums, but his efforts, owing to our unpropitious climate, were of little avail.

This desire had been for years past agitating the minds of the French, and Mons. Pelée raised a few early-blooming kinds, some of which were mentioned in the "Gardeners' Magazine of Botany," and others are still known to us, such as *Cromatella* and *Delphine Caboche*. In addition to Mons. Pelée there were others who strove to produce varieties of this description, among them being Mons. Lebois, who had vainly sowed and sowed without obtaining anything to reward him that flowered before the 15th October. In his efforts to succeed he exposed plants in the broad open sunshine, trained them to an espalier facing the south, cultivated them under glass, and even in a stove-house, but still he could only bow before the inflexible will of the plant, which always failed to bloom earlier than the date just given.

At length by the kindness of Mons. P. Coindre, Director of the Jardin des Plantes at Avignon, a town in which the endeavours of the early Chrysanthemum growers were eminently successful, he received from that gentleman two seedlings which were in full bloom as early as the month of August. From these two plants he obtained about two hundred seeds, which being sowed in the month of February, 1853, gave rise to nine very double distinct coloured new sorts; and so much was he interested in his success in raising new varieties of the summer-blooming kinds that for a time he quite neglected his old collection. After his decease Madame Lebois, his widow, continued to raise and send out varieties of this sort, a few of which are still in cultivation.

More recently Mons. Bouchardat, Mons. Pertuzes, and Mons. Lacroix have raised varieties of this rapidly increasing section that gives every promise of becoming as much appreciated as the later-blooming class. Mons. Delaux has also contributed many varieties. This year, in announcing a set of five Japanese summer-blooming Chrysanthemums—viz, *Fleur d'Été*, *Été Fleuri*, *Mandarin*, *Roi des Précoces*, and *Bouquet Estival*, the result of fifteen years' labour, he tells us they will create a sensation in the horticultural world, and no doubt looks upon them as one of his greatest triumphs.—C. HARMAN PAYNE.

(To be continued.)

NOTES ON ROSES.

JUDGING from all I have seen and heard 1885 will be considered a first-rate Rose year. The best blooms in certain districts were some weeks later in coming to perfection than has been the case in some seasons, but the quality generally has been over the average. Plants have been remarkably free from blight, and although the early summer winds rather injured the tops of the first buds, no trace of this could be seen at the time the plants were in full bloom. Rose shows have been interesting and good. The first of the year I saw was at Cardiff on July 1st. This was an excellent show, and many of the blooms were not surpassed on any subsequent occasion. Not many gardeners will be able to speak of what they saw at the Crystal Palace Show on July 4th. A capital report of it might have been read by buying the Journal for 3d., but the Show itself could not be seen under

7s. 6d., and I would think seriously about disowning any friend of mine who was foolish enough to pay such an absurd sum to see a Crystal Palace Rose show, more especially when a much more interesting one could be seen a few days later for 1s. I am now referring to the Show of the National Rose Society, which was held at South Kensington on July 7th. This was a magnificent show, and worthy of the most careful inspection; indeed such a superb show and liberality towards the public deserved universal support.

I am going to be disloyal enough to say I do not think much of Her Majesty as shown by Mr. Bennett. It is neither compact nor well formed, and much too large to be generally valued as a decorative Rose, and is not fragrant. I would describe it as an immense Baroness Rothschild. Mrs. John Laing is to my mind a much better Rose. It is light pink in colour, of fine form, great substance, and very fragrant. I felt thoroughly disappointed with A. K. Williams, the blooms being small, as a rule, and not well formed. Marie Baumann did not get more than it deserved when it was awarded a medal as being the best H.P. This is really a first-rate all-round Rose, and stands the test of time as well as any of them. Its pleasing colour and fine form are always attractive.

Were I growing Roses to supply any of the best London florists with good and effective cut blooms, I would grow Merveille de Lyon by the thousand. To my mind it is the finest white Rose in existence. In size and purity it is superb, and its fragrance adds another point to its numerous qualities. The position the blooms occupied did not show them off to advantage at the National, but for all that there was hardly any possibility of getting near to where they were. Amongst the scores, indeed I might say hundreds of blooms shown, I did not notice a really inferior one, and the general uniformity of all argued well for the constancy of this Rose.

Lady Mary Fitzwilliam is certainly a massive Rose, but for many forms of decoration its size is against it. It is the largest of all Teas, if this is its class. Ulrich Brunner is a capital Rose as seen in the stands, as its colour, a cerise red, is so very decided. Tea Comtesse de Nadaillac was very attractive. Its colour is a bright rose on yellow ground, large and globular. David Pradel was out of the common, being of a peculiar lavender colour and very pretty. Other varieties I noted as being of special merit were Duke of Albany, Alphonse Soupert, Crimson Bedder, Souvenir d'Elise, Marie Raÿ, Constantin Tretiakoff, Anna Ollivier, Innocente Pirola, Madame Welch, Gloire de Vitry, La France, Madame H. Jamain, Magna Charta, Xavier Olibo, Horace Vernet, and Caroline Kuster.

All who love to see Rose culture extended should thank the Rose Society for offering two such magnificent trophies for competition. It is not every day or every year that one finds a prize valued sixty guineas offered for garden produce, and no wonder they produce keen competition. I never saw Rose blooms at any show remain so fresh as did those at the National. Probably the free way in which the conservatory was ventilated may account for this. The Rev. W. H. Jackson, who won the Veitch Memorial medal for twenty-four distinct blooms in the extra classes, is evidently a keen Rose grower. I was suggesting to him that he should take Canon Hole's place in writing on Roses for the Journal, and I hope he will do it, as I am sure he could tell us much which would be of great value to cultivators generally. I understood Mr. Laxton to say that it was Mr. Jackson's son who was the Rose-grower, and I took the liberty of informing the rev. gentleman that I thought his son must be a very good hand at the work, when the medallist quietly informed me that he was a "bachelor." Ah! Mr. Laxton.

The early part of July was a thorough Rose time in London. I saw tens of thousands of blooms used in table and room decoration in West End mansions. They were numerous displayed in all the florists' shops. Ladies' heads and dresses were adorned with them, gentlemen's buttonholes contained many choice buds, and men, women, and boys sold them about the streets at a wonderfully cheap rate. Their beautiful colour, fine form, and delicious fragrance were delightful in all cases, and it is in no way surprising that the Rose should be regarded as the queen of flowers, or that its cultivation should be so rapidly extending. Until lately I had no idea that Roses figured so largely in London floral decorations. One firm alone, Messrs. Nieman & Cornish of Orchard Street, Portman Square, were using from 5000 to 7000 blooms daily so long as they could get them, and the effect they produced when placed on dinner tables or ballrooms was charming in the extreme. They buy their blooms from Messrs. Paul, Cant, Turner, or others of the large Rose growers, and I saw thousands of such kinds as Baroness Rothschild, Général Jacqueminot, Baron Adolphe de Rothschild, and Charles Lefebvre as fine as any at the Exhibition. No inferior blooms

are used, and many colours are not introduced, scarlet and white or scarlet and pink being preferred. Many who go through nurseries wonder where all the Roses which they see growing can go, but when one sees how very extensively they are employed, and how fashionable they are, it is easily enough understood why stocks are being increased and so many grown. The *Journal of Horticulture* has always been noted for the attention it devotes to Roses, and if practical notes on the subject bulks largely in it until another harvest comes, I am sure they will be valued and read with interest by old and young growers of Roses.—J. MUIR, *Margam Park, South Wales.*

DODECATHEON SPLENDIDUM.

THE American Cowslips, or Shooting Stars as they are called in the west, have within the last few years increased wonderfully both in numbers, size, and beauty, and indeed may now be classed amongst the

Fig. 18.—Dodecatheon splendendum.

most desirable late spring and early summer plants we grow for outdoor decorative purposes. As found in gardens at the present time the nomenclature may be said to be a little confusing, although perhaps not more so than is generally the case with plants that are everywhere appreciated. Dr. Gray and Mr. Sereno Watson, we believe, are agreed in considering them all varieties of *D. Meadia*, and class them accordingly, but many of the forms we know in gardens are so abundantly distinct from that species and the names already sufficiently complicated that we rather incline to the old regimen, and speak about them as we and everybody else have long known them. *D. Meadia* is a very old garden plant, being among the first dozen plants figured in the "*Botanical Magazine*;" it is well worthy a place among the rest. It grows generally about 1 foot in height, carrying an umbel of from six to twenty or more flowers, rosy purple with a

bright red crown. The leaves are mostly lanceolate and more or less toothed. *D. integrifolium* is amongst the prettiest; its flowers are 1 inch long, of a rich purplish crimson, having an orange crown. It does well on the rockery. *D. brevifolium*, *frigidum*, *alpinum*, *latilobum*, *lancifolium*, *Jaffrayi*, and *macrocarpum* are all desirable plants.

D. splendiam, illustrated in the accompanying cut, is to our thinking the most beautiful of all the American Cowslips. It forms a pretty little rosette of oval leaves, from the centre of which rise many flower stalks 8 or 10 inches high, each carrying about a dozen extremely handsome rich purplish crimson flowers with bright orange crowns, and larger than those of *integrifolium*.

All those enumerated above may be cultivated with ease in any garden if provided with the necessary shade and shelter. We are of opinion that position has much more to do with the successful cultivation of these truly handsome flowers than the given mixtures of sand, peat, and loam. Positions where *Soldanellas* and our native *Primroses* thrive will be found suitable for the *Dodecatheons*, partly though not absolute shade, and a light and well drained soil.

They ripen seed pretty freely, by which means they may be increased, or else by parting the root, but as this is rather a dangerous mode it had better not be resorted to unless in extremes.

The variety represented was procured from Mr. Ware, and was certificated at the Floral Committee of the Royal Horticultural Society a short time ago.

A DAY IN KENT.

ENTERPRISE EXTRAORDINARY.

A DRIVE through the fruit-growing district of Kent when the Strawberry and Raspberry crops are being gathered is particularly interesting. The configuration of the "Garden of England" is boldly undulated, and there is consequently a great deal of uphill and down in traversing it. This enables the crops to be seen from various points to better advantage, the sloping fields and regiments of "pickers" being conveniently arranged for a passing inspection.

For miles there is little but fruit, and, it must be added, weeds to be seen. Now and then we pass a piece of Wheat, and one of Oats was observed in a twenty-five-miles drive; but instead of fields of corn and Turnips, as in agricultural districts, there are vast stretches of Raspberries, Currants, and Strawberries, and in one particular piece there could not have been less than from 200 to 300 persons, old and young, gathering the crops. By the hedgesides are wooden shanties for their accommodation, and round wigwags of old oilcloth or sacking, somewhat resembling the Zulu kraals as they are illustrated, only not so good. In this way the pickers, many of them from the east end of London, lead a gipsy's life for some weeks, the little urchins, too young to labour, turning "cartwheels," or standing wrong end upwards in the dusty roads shouting for coppers.

Much has been done, no doubt, during recent years in improving the land in Kent and converting useless wastes into fertile tracts; but a great deal more remains to be accomplished before the district through which we passed can rightly claim the appellation of "garden." Granting the excellence of culture in many fields, others were ablaze with Poppies, and weeds of various kinds were struggling with each other for supremacy; and as for the fences, they are wildly picturesque, no doubt, by alternate masses of Brambles, "gaps," and festoons of the Traveller's Joy, but with a few exceptions they are anything but suitable boundary lines for a "garden." "Enterprise" is visible enough in places, but neglect is still obtrusive, and much land is waiting to be tilled. The fruit crops appeared good, especially Apples and Raspberries. Strawberries were practically over, and Gooseberries and Currants could not be very well inspected in rushing through the lanes with a gardener handling the ribbons, and his passenger holding on as if preparing for a spill.

"But where are we going?" "I think," said the jehu, "we will go to Bexley Heath and see Phillip Ladds' place." "But do you know him? can we get in?" "Well, I have seen him, and I know the foreman, and we shall be all right. If we see Mr. Ladds I am sure he will not object to us; but it would never do for him to be pestered by a lot of cockney tourists, who do not know what they are looking at in such a place, and can hardly let the flowers alone." After that little dialogue on we went. A drive out of the lanes into a broad and excellent highway flanked by pretty villas brings into view long ridges of glass. "Ah! here we are. We will turn down the lane and drive right into the place." In truth there appeared nothing to keep us out of it, neither walls nor doors nor gates, and we drove in.

It was clearly an advantage to "know the foreman;" and a genial man Mr. Bailey is, and without doubt able, for only a man of ability could keep things "square" in such a charge. We were fortunate, too, in being introduced to the proprietor, and it were impossible for anyone to accord to strangers a more courteous, frank, and agreeable reception. He made us at home at once, and in five minutes it seemed as if we had been friends for years. "We are not afraid of anyone seeing us and everything we have" was his remark, "but we cannot be bothered by everybody, or the work would never get done." A perfectly reasonable

observation. Mr. Ladds is evidently too strong to have any "little secrets," but is alike ready to give or to receive information. He is not the tearing, driving, bustling man that many imagine. Such men are apt to make mistakes. He is calm and reflective, yet quick to act when he sees his way. It is very certain that he has not erred very seriously in building up his business. He started in as small a way as ever a humble worker did, and now his trade is of a magnitude that has won for himself an European fame, and his name will have a prominent place in the history of horticulture.

There was very little glass at Bexley Heath twenty years ago, and now there is a village of it—a hundred houses, and not little ones. The majority are upwards of 200 feet long, the *Gardenia* house being 300 feet in length and 35 feet wide. The plants are in large pots—luxuriant bushes that yield hundreds of thousands of flowers. Several of these great houses are filled with Tea-scented *Roses*, neither young nor small, but clean and healthy. These are trees rather than plants, in large pots, and the yield of blooms must be enormous of such varieties as *Niphetos*, *Isabella Sprunt*, and *Safrano*. They are repotted, or the food-store replenished, as soon after the present time as possible, but regard is had to the main object of having blooms all the year, and all the plants are not overhauled at once. House after house is filled with *Bouvardias*, "all for cutting;" and a few acres of glass cover *Zonal Pelargoniums*, mainly for affording cut flowers in winter; but they must be had at all times, and there was a sea of flowers. In reply to a query, "What sorts do you grow?" The answer was, "We try many, but taking all things into consideration we have no scarlet equal to *Vesuvius*, no pink equal to *Master Christine*, and certainly no white equal to *Queen of the Whites*." "Queen of the Whites!" we repeated, "is that what Veitch's are sending out?" "The very same, and it is the best of all; look at it; compare it with the others; it is the best truss, has the purest flowers, and, another thing, it does not shake—no gumming wanted; see"—and off comes some snowball-like trusses that are knocked over the hand, and the petals remain intact—"that is the *Geranium* for market and for me." So said Mr. Ladds, and we could only reply "It seems the one for everybody." But the "sight" in the flower department is the *Tuberose* and *Stephanotis* house—10,000 *Tuberoses* in flower in 5-inch pots, a forest of splendid spikes and flowers, and as many clusters of *Stephanotis* on the roof nestling amid luxuriant leaves. "How are the plants kept so fresh, so clean?" Answer, "Water, liquid." Yes, water and liquid manure work wonders when freely, yet judiciously, applied.

A little fruit remains to be noticed. The Tomatoes may be passed, as only two or three tons are grown there, and a ton of Tomatoes is, comparatively speaking, a trifle with Mr. Ladds, who counts his tons by scores; but the Grapes cannot be passed. Fancy span-roofed houses about 20 feet wide and 200 to 300 feet long laden with Grapes from eave to apex, the bunches almost touching each other. Stand at the door, stoop down, and look at the mass of fruit, it is then a question if the reality is comprehended. The spectacle is astonishing. The varieties are *Gros Colman*, *Alicante*, *Lady Downe's*, and *Muscats*. But "*Lady Downe's* don't do," says the owner, "and what is the use fighting with it? Others can grow it, and they may. I grow what suits the place." It is by taking this common-sense view of things that has made Mr. Ladds what he is to-day. The others "suit the place," or the place suits them. Something has been heard of the Muscat house at Longleat. Admitting all that has been said about it, the late gardener at Longleat, Mr. Taylor, and the present one, Mr. Pratt—and it would not be easy to find two better growers and judges—will, if they can visit Bexley Heath, acknowledge the crop there to be good. They will see such a magnificent mass of Muscats as they have never seen excelled. They have grown larger bunches and equally good berries, but they should still see the weight of the crop and quality of the fruit at Bexley as grown for the London market, and they would recognise the skill of the cultivator. The roots of the Vines are inside. One of the houses was perfumed with guano, in another a bag of nitrate of soda was being reduced, and water is laid on everywhere. Perhaps these have something to do with the crops. The establishment under notice has grown by degrees to its present magnitude. It is very plain. There is no ornamentation about it, but it is just a great feeder of the mighty maw of London—a striking example of what can be accomplished by sound judgment, attention, and perseverance; but after all it is only part of the business of Mr. Ladds.

We drive on to Dartford Heath, about four miles distant. This is a new place. Twenty low span-roofed houses, about 150 feet long each, are completed in one block, and fifteen in another. Three vineries 300 feet long are arranged side by side. They are divided by pillars, so as it is really one great house with a ridge-and-furrow roof covering an acre of ground. The Vines are still young growing freely, the house in the meantime being occupied with Tomatoes planted about 2 feet apart in rows 3 feet asunder secured to stakes. The smaller houses are similarly planted with Tomatoes, Peaches in addition covering the roofs of some of them. About 500 trees have been planted as a little experiment, and as these are promising very well indeed, and have afforded 10,000 Peaches this year, it is not unlikely the 500 trees may increase to 5000; no one knows, for Mr. Ladds is apt to exceed in his acts the anticipations of most people. The Tomatoes were flowering freely, the houses being kept quite dry till the fruit is set, then water is given to push on the swelling. The soil is light and gravelly, but manure and deep trenching work wonders. Thirty tons of Tomatoes were sold last year from this small place, which is in charge of Mr. Cheesman, whose heart is in his work, or he would not do it so well.

Three miles distant from Dartford Heath is Swanley, a better cultivated district than we have hitherto traversed. Swanley is already a

familiar name to readers of horticultural literature all over the civilised world, for is not the "Home of Flowers" there? Mr. Cannell has worked wonders, and a sincere hope may be expressed that he will live long to enjoy the fruits of his labour and enterprise. But what can be said of the "Home of Fruit?" Considering that three or four years ago the site was a poor and practically barren field that nobody would look at, it is positively astounding. As an example of trade enterprise Mr. Ladd's establishment has no parallel in its way, and it is not too much to assume that no other man living could have done what he has accomplished in the time. Three years ago a bed of gravel covered with Thistles and other weeds; now not less than sixty-five admirably finished span-roofed structures 240 feet long, and not only finished, but occupied, the roofs of five houses covered with Grapes, or the crops cut, and some more with splendid rods, others planted with Maréchal Niel and Gloire de Dijon Roses, and the whole block having as a boundary a span-roofed vinery 686 long, and 25 feet wide without a division. The Vines, Gros Colman, are growing freely, and the borders are occupied with Tomatoes in fruit—a forest of them. Two thousand pounds of fruit had been sent off on the day of our visit, and a telegram arrived, as we did at 2.30 for 2000 lbs. more by the three o'clock train, and the active foreman, Mr. Field, I think, sent it off. That is the way to do business. About 70,000 Tomato plants are fruiting or will fruit this year at Swanley, and the crop will not be less than 80 tons; and altogether Mr. Ladd will market at least 100 tons of Tomatoes this year, probably many more, and very soon he will have as many tons of Grapes. How does he sell such quantities? There is only one reply, By sending the best produce into the market in the best condition. This commands a sale, and the inferior hangs on the market, and gives the producers no returns worth noting. Hundreds of tons of fruit are sent to London that the sellers do not know what to do with; it is either badly grown or improperly packed, and then the owners wonder at the market prices they see in the papers. The time has gone by, or is departing, for sending second and third-rate garden produce to town in the hope of making a fortune by its sale.

All the houses are built of pitch pine, painted three times, glazed with 21-oz. glass, 17 by 13 inch squares well embedded in putty, but no top putty used. The hot-water pipes are jointed with cement and well caulked, never fail, split, nor break, but, as is proved at Bexley Heath, last for a generation. The boilers are also composed of similar pipes placed horizontally with their ends connected with terminal water ways. This boiler in its perfected form is termed the Rochford, and is employed because of its simplicity and power.

The roofs of large houses are kept rigid by purlines supported on pillars, the said purlines being 1½-inch iron pipes connected with the water mains. On these pipes are valves at intervals, and by turning them and screwing on the hose, for which provision is made, the houses can be watered with the greatest ease and to any extent desired. This is a first-rate arrangement and worthy of being kept in mind. A slight error has been made in fixing some of these pipe purlines that is worth mentioning. They were fixed rather too near the ends of the houses, and the expansion of the iron by heat has broken the glass. In the completion of the gigantic work so far as it has gone that appears the only little mistake that has been made. With the exception of the three large vineries at Dartford, which are 13 feet or 14 feet high, with side lights, all the others are low, not above 7 feet or 8 feet high, and thus the Grapes can be easily reached for binning. There are no side lights. The angle of the roofs is about 45°.

The houses are ventilated by about 3 feet square glazed lids at intervals in the roof; in fact, the width of two squares of glass, the rafter being shortened so that the portion removed fits exactly across the space and forms a bar, so that not an inch of wood is wasted. These lights are opened and closed by weights and pulleys, a piece of iron pipe filled with cement making a capital weight. The front ventilators are in the form of lids in the side walls. These lids hang on pivots near the top, and also in the centre of each board, and near the top a piece of iron hangs. It is about 6 inches long and the size of a pencil. When the ventilators are opened—that is, pushed outwards from the inside of the house with a rod for that purpose, this iron naturally falls and rests on what may be termed the floor of the embrasure, and props up the lid securely. In closing the man walks along, knocks away the prop, and the lids fall like the lid of a mousetrap, and all is safe. The plan is the very essence of simplicity and unerring in action. "Opening the front ventilators all at once by turning a handle without going through the houses is all very well," says Mr. Ladd, "but I like a man to go through, as in attending to the ventilators his eye might catch something else that wants attending to, and that otherwise would not be seen." Thus have all the details of forming and working this greatest establishment been thought out. It is not completed yet. Many more houses will be erected with another boundary structure at right angles with the present one, but longer by some 200 feet, so that these two structures alone will exceed a quarter of a mile in length. The rafters of the houses are 3 inches deep and nearly 1½ inch wide, six being cut from a 9-inch deal.

Two thousand frame lights are being made of pitch pine, probably for sheltering Heatbs, of which a few thousands are on trial and looking well. In the meantime several lights are employed for sheltering Strawberries for forcing, of which 200,000 are grown in 5-inch pots. A crock is placed in each pot, then half an inch of soot, and the soil is next hammered in by boys. The runners are cut off before rooting, but with rootlets visible, with an inch or two of each below the node. These are inserted quickly and firmly, like putting in cuttings, and not one in a hundred fails to make a good plant. That is the quickest way of all, and is practised all through the early part of the season, only the late runners being pegged into pots

before being detached from the plants. The gardener's method of layering into small pots and shifting into larger is laughed at, as involving a needless waste of time and labour.

It is surprising to see how well Strawberries grow in what resembles a bed of gravel, and the growth of the vines is remarkable by its excellence. Deep trenching and heavy manuring, with free drainage and abundance of water, is the secret of it all. Digging a "spade deep," no matter how much manure were used, would be playing at cultivation in a soil like this. It would simply end in failure in comparison with the magnificent success achieved. The land is trenched from 2 feet to 3 feet deep, according to the subsoil, and from 60 tons to 100 tons of manure are buried in a 240-feet-long bouse. "Such free open soil as this," observes the owner, "never sours, and I like land that will stand manure." Mr. Ladd's having risen from the ranks, and become a king among cultivators, can show the soundness of his judgment and practice by its fruits. He is still in the prime of life. He is a shrewd, clear-headed, closely observant, and deep-thinking man, quick to act when he sees his way, but until then he does not move; he is, in fact, the very embodiment of the valuable axiom, "First see your way, then go ahead." Some persons go ahead before seeing their way clearly; they are "too fast," hence fail. Others see their way and dare not go ahead; they are too slow or timid, and so miss their chance and lag behind. But how are all the Grapes to be thinned when the Vines in Mr. Ladd's four establishments are in full bearing? If he lives, and all goes well, he will in a few years have a length of five miles of span-roofed vineries in bearing. The thinning will be a formidable task, but it has all been thought out. He can "see his way" to solve the problem, and when the time comes he will "go ahead." The Grapes are sure to be thinned, and if I live I will see his plan in operation, and report the further progress in this extraordinary enterprise. The worst of it is, Phillip Ladd's great work makes me, at least, feel small, and if I express my feelings in a signature it must be—
A SLOW-COACH.

DEATH OF MR. JAMES CUTBUSH.

It is with great regret that we have to announce the death of Mr. James Cutbush, which took place early on Sunday morning, August 2nd. The deceased gentleman, who was well known as the head of the firm of W. Cutbush & Son, Highgate, was universally respected, and the news of his death will be heard with sorrow and surprise by numbers of friends who had seen him apparently in his usual health but a short time previously. Though Mr. Cutbush's health has not recently given his friends serious cause for alarm, yet he had, we hear, felt somewhat unwell for some time past. He conducted his business in the usual way, however, and until a few hours before his death was in his nursery. Subsequently he attended a presentation of prizes by the Baroness Burdett Coutts at a local flower show, and it was while speaking there that he was seized with an apoplectic fit. Medical aid was at once summoned and he was removed to his home. On his arrival there he rallied somewhat, and was able to walk into his house with assistance, but he was afterwards seized with another fit and expired soon after midnight. Mr. James Cutbush was fifty-seven years of age; he was in business at Highgate about thirty-five years, but the firm has been established upwards of 150 years. The business of this firm will be conducted in future by Mr. Herbert Cutbush, eldest son of the deceased, who was absent in Scotland when the sad event occurred. The remains of Mr. James Cutbush will be interred in Highgate Cemetery to-day (Thursday) at three o'clock in the afternoon.

GRAND NATIONAL DAHLIA SHOW.—We are requested to announce that "at a recent meeting of the subscribers to the prize fund for the Show to be held in September next at the Crystal Palace it was decided to offer a prize to be called the Turner Memorial Prize as a memento of the late Mr. Charles Turner of Slough, who laboured so assiduously towards the establishment of these exhibitions. Several subscriptions varying in amount from 2s. 6d. to 21s. have been received for this object. Those who desire to contribute either to this or the general fund are requested to send their subscriptions within the next few days to the Hon. Treasurer, Mr. Thomas Moore, Botanic Gardens, Chelsea, S.W., in order that the conditions of the prize may be settled at the next meeting of the Committee, which will take place shortly." It will be seen that a proposition of wider scope is made in another column by Mr. J. Douglas.

— WRITING from Northenden, a correspondent observes:—"Strawberries are not doing well here this year, as though there is an enormous crop the berries are rotting and moulding off in thousands, the result of unfavourable weather. Roses just now are here in their full beauty, so you see what little chance we northerners had of competing at the National Show. No mildew as yet, but green fly galore."

— A WELSH gardener writes :—"GROS COLMAN GRAPE ripens earlier with us on its own roots than when grafted on Foster's Seedling. I think it is rather singular that this should be so, as one would think the early stock of Foster's would produce ripe fruit first, but such is not the case. The two are growing side by side and show the difference very markedly. The berries on the Foster's, however, are much the finer and promise to be much larger than any we have ever had on the Colman root. I consider Foster's Seedling a good stock on which to work almost any kind of Grape."

— PITTOSPORUM TOBIRA. — Mr. A. Young writes :—"In Mr. Balchin's nursery at Cliftonville, Brighton, the above old, beautiful, and highly scented Japanese shrub has lately been flowering most freely in the open air. It has been planted out for several years. Any greenhouse shrub which will succeed in the open air in this country is always regarded with additional interest, and probably the above instance may induce others to give this plant a trial if they have a sheltered position in which to plant it."

— "LANCASTRIAN" writes :—"PHLOX MRS. DOWNIE, white with a crimson eye, is decidedly one of the most beautiful light-flowered early-flowering Phloxes in cultivation. It does not exceed 18 inches in height, and produces large branching heads of bloom for fully half that length and nearly as wide through. This is more especially the case from young plants propagated from cuttings last September. Old plants do not produce quite such large heads of bloom, but a dozen or more flowering shoots from a stool are most striking when in flower either for the herbaceous border or for dotting at the front of shrubs."

— THE same correspondent observes that PENTSTEMON MRS. HEYWOOD, a variety sent out by Mr. Downie of Edinburgh in 1883, is a remarkably fine light variety. The flowers are white, tipped at the back with rose, which gives them a striking and very pleasing shade of colour. It is a remarkably dwarf-growing variety, not more than 14 inches high, free, and a good grower, and one of the most profuse flowerers amongst these plants known. It grows quickly, comes into flower before the majority of varieties, while the flowers individually are large and closely placed upon the spike. It makes a beautiful bed planted by itself, or is very suitable for edging a border or large bed of taller and darker varieties.

— A PRACTICAL gardener writes :—"Mr. W. Bardney, at page 225 and "A Working Gardener," at page 250, called attention to the inadequate arrangements generally provided for CLEANSING BOILERS. Some time since I had an opportunity of inspecting an arrangement of pipes by an eminent firm of hot-water engineers, and they had provided excellently for getting rid of the dirt that is apt to accumulate in the pipes, and that was by the means of a sledge box about 2 feet 6 inches in length and 4 inches square. A cap was fitted in the bottom so as to provide means for cleaning it out. This box was cast on the last length of the return pipe. By this arrangement the dirt fell into the receptacle provided for it without entering the boiler."

— It is stated that the JERUSALEM ARTICHOKE is being extensively cultivated in Belgium, as by a new process of distillation some 8 per cent. of alcohol can be obtained from its tubers. More than 3500 acres of poor, almost waste land, around Antwerp will this year be cropped with the plant. The residue after distillation is nutritious. France is thus also in the way of cultivating large stretches of her poor thin, chalky, and schistose soils with this new crop. Artichokes are now being cultivated alike in Iowa and Arizona as a material for fattening pork. In field culture they are replanted once in two years. An Iowa farmer finds one or two acres sufficient for quite a large herd of hogs.

— A CHESTER correspondent informs us of a rich display of flowers on the premises of Messrs. F. and A. Dickson & Sons on the occasion of the musical festival in the old city, goes on to say, "I found amidst the floral beauties and novelties on show a splendid specimen of VANDA SANDERIANA grown by Arthur Potts, Esq., of Hoole Hall. It is so seldom that one sees this beautiful Orchid that a sight of its glory was as welcome to me as a patch of Ophrys aranifera would be to a British Orchis hunter when in search of something out of the common. The Roses at the Upton Nurseries are still fine at present, and I was informed that Messrs. F. and A. Dickson & Sons allow visitors the privilege of walking through their beautiful grounds on application."

— WE are informed that "PHORMIUM TENAX VARIEGATUM is now flowering in the gardens of J. F. Eltringham, Esq., Westoe, South Shields

It has a spike 10 feet high, with twelve racemes; the colour is attractive, between coral and brown. It is in a 16-inch pot, and has not been potted for four years. It contains an exudation of a sweet and agreeable flavour. Outside some beds have been recently planted with Roses, which were doing very well, considering that they are within a mile of two large chemical factories. The glass structures contained excellent plants, reflecting credit on the gardener, Mr. Chas. Wood."

— A GRAVESEND correspondent writes :—"A REMARKABLE MIGRATION OF APHIDES has been taking place in this and other parts of Kent during the last ten days, which may have come under your notice. In fact, on a visit to London last Thursday I found the insects were passing through several metropolitan districts, indicating that this migration has extended over a broad area of country. So abundant have the insects been on some days that they proved a nuisance to by-passers, entering the eyes, ears, and mouth. This is not one of the two great periods of aphid migration (May and September usually), and I apprehend these swarms have been started by the absence of sap in their food, due to the dry weather."

— LORD NAPIER NECTARINE.—In looking through a friend's garden a few days ago we noticed a tree of this fine Nectarine in grand condition growing against the back wall of a lean-to vinery. The crop was nearly taken at the time of our visit, but a sufficient number of large highly coloured fruits remained on the tree to demonstrate what an excellent variety it is in every respect even when grown under somewhat adverse conditions as regards light. In the same garden we noticed a tree of the same variety growing in a lean-to cool Peach house, and trained to a trellis within as many inches of the glass as the one mentioned above is feet, carrying an immense crop of large and, as might be expected, finely coloured fruit, to swell which the tree, in common with all the trees in the same house, is given a liberal and frequent surface-dressing of Beeson's manure, in addition to copious supplies of liquid manure being applied to the roots at short intervals. Thus by liberal feeding at the roots heavy crops of large fruits are annually secured without in any way enfeebling the trees, as the fine condition of the latter fully testifies.

— FUCHSIA ROSE OF CASTILE AS A WALL PLANT.—Mr. H. W. Ward writes :—"We have a plant of this old favourite free-flowering Fuchsia, which covers a trellis on one of the division walls in our conservatory with a profusion of large flowers, the tube and sepals of which are white, shaded with pink, and the corolla puce. Just now, and indeed for nine months out of the twelve, this plant attracts the attention of all visitors. Early in spring every year—for the plant is an old one—the shoots are thinned out and shortened back a little, the soil at the roots reduced, and the plant repotted in three parts of light sandy loam, and one of horse droppings and leaf mould, with a dash of sharp sand to render the whole somewhat porous. Water is given to the roots after the plant is potted, and the shoots syringed every morning and afternoon during bright weather until the flowers begin to open, when it is discontinued and copious supplies of liquid manure is given to the roots, and all seed-pods are kept persistently picked off so as not to unnecessarily waste the energies of the plant in that direction. A couple of years ago we saw some arches and pillars which were rendered interesting objects in one of the houses (since remodelled) in the gardens of Bagshot Park, the seat of His Royal Highness the Duke of Connaught, by being draped with grandly flowered plants of another old favourite variety of the Rose of Castile type, Venus de Medici."

— FORESTRY.—The Select Committee of the House of Commons appointed on the motion of Sir John Lubbock to inquire into the desirability of establishing a FOREST SCHOOL IN ENGLAND, recently took the evidence of Mr. W. G. Pedder, Revenue Secretary of the India Office, and well acquainted with the forestal system of India. Mr. Pedder stated that a forestal department was authorised in Bombay in 1846. About that time the revenue from the Indian forests was £40,000. Since then it had risen to a gross revenue of nearly £1,000,000, and a net revenue of over £400,000, and that he considered was undoubtedly due to the increased education of forest officials. Instructors were obtained from France and Germany, but latterly chiefly from France, because it was found that the woodlands of England and Scotland were not so well managed as to enable the managers to give instruction. Instruction was now given at the Royal Engineering College at West Hill, where the students, in addition to the engineering course, received training in forestry, botany, forest law, and jurisprudence. The fees were £180 a year, and the course was intended entirely for the upper grades of forest manage-

ment. There was a school in England for the inferior grades. From 1867 to 1885 the competitors for forest service in India were 511, all Englishmen, Scotch, or Irish. The inferior grades were filled by natives. The principal causes of the destruction of forests were trespass, claims for free wood, and forest fires. Protection was made against the latter by forest roads and fire breaks, one of which, in an Indian forest in Scinde, was 174 miles long by 100 yards wide, and by rewards for extinguishing fires. Forests were destroyed by grazing, but it was admitted that in a forestal growth for 150 years pasturage might be allowed for seventy years after the timber had obtained sufficient growth. During the Franco-German war the forestal service of France furnished 5000 volunteers, and he had no doubt there were as many persons employed in forestal service in India as in France. The actual value of the Indian forests had not been ascertained. The denudation of forests in India undoubtedly interfered with the water supply, and to that extent was a potent cause of famine. In answer to Mr. W. H. Gladstone, witness said forestal planting had been very successful in India, especially in mixed forests. Colonel Michael, C.S.I., who assisted in the early establishment of the forestal departments of India, gave evidence on the great value of Indian timber, and especially teak, some of which was worth 6s. per cubic foot. It was used for backing the armour of ironclad ships and targets. He considered a forest school in England would be of immense value, particularly to proprietors of woods, who would then have better trained men than they could get now.

PROPOSED MEMORIAL TO THE LATE MR. CHARLES TURNER.

I MET at the Carnation Show Mr. Glasscock of Bishop's Stortford, who told me it was intended to raise funds for the purpose of providing certain prizes at the Grand National Dahlia Show as a memento of the late Mr. Charles Turner. I was too busy to take any notice of it at the time. I now read a paragraph in most of the gardening papers that subscriptions may be sent in to the Hon. Treasurer, Mr. T. Moore. May I be allowed to say—first, that sufficient prizes are already offered to make a first-rate Dahlia show in the schedule already published, and if larger prizes were offered the best blooms would be merely shifted from one class to the other, an arrangement which would make scarcely any difference to the general effect. I wish to say in the second place, that raising a few pounds to provide prizes at one exhibition for Dahlias is an arrangement totally inadequate to provide a memorial for Charles Turner. Now that the idea of a memorial has been started, it must not be a local affair, as this promises to be, but a national one. In order to carry this out I propose that a preliminary meeting be held at South Kensington on the 11th of August, immediately after the various Committees have completed their labours, which will be at 12.30 P.M. The name of Turner is honoured and respected all over the country, and an appeal for funds, backed up by the leading horticulturists of the metropolis, would meet with universal approval and support.—JAS. DOUGLAS, *The Gardens, Great Gearys, Ilford.*

[We fully agree with our correspondent that a prize, or prizes, offered for any particular florists' flower, is inadequate as a memento of a florist who worked so long and successfully over a very wide field, and no doubt the promoters of the prizes referred to by Mr. Douglas will readily join in the consideration of the larger scheme suggested.]

THE INSECT ENEMIES OF OUR GARDEN CROPS.

THE PEACH.

IN most collections of our British moths we shall see the insect called the Peach-blossom moth (*Thyatira batis*), a species by no means rare, if somewhat local. It might be hastily concluded by those unfamiliar with this species, that the caterpillar committed damage upon the blossoms of the Peach, but it is innocent of feeding upon anything save the leaves of the Bramble about August or September. If we look at the moth the name explains itself, for on the rich brown wings are arranged four spots of pink and white, resembling the fallen petals of some fruit tree, though not specially suggesting to us the Peach perhaps.

Then there is another moth, set down in many books on gardening as a Peach foe, but which has really given no trouble to the grower in Britain, for the caterpillar is, with us, content to feed on Whitethorn or Blackthorn. So conspicuous were the ravages of this species in some parts of the Continent, however, that the excellent Linnaeus called it the "pest of Pomona," and since his time the caterpillars have been detected in the act of feeding, not only upon the leaves of the Peach and Apricot, but also upon their flowers, and though not belonging to the bulkiest of the caterpillar tribe, their appetites are very voracious. This species has received the English name of the "figure of eight," though it might as well be eighty-eight, for the forewings, which

are of a dull brown, with a pearly gloss, have each two white spots, which might be thought to resemble this numeral, or kidneys. The eggs, which are deposited in September, hatch early, and the caterpillars are adult about June. As they might occur on English Peaches, it should be stated that they are of a peculiar greenish-white colour—that is, unlike the tint of caterpillars we mostly meet with, yellow striped, and dotted with hairy warts; the small head is almost blue, having two black spots. They cling rather tightly to the twigs, so cannot well be removed by shaking their food plants. At the age of maturity they are about $1\frac{1}{2}$ inch long, and spin a cocoon, from which the moth soon after emerges. And in point of fact, although there are several caterpillars that do feed in Britain upon the buds or leaves of the Peach, and inflict a variable amount of injury, the greater mischief that is done to this fruit tree arises from insects of diminutive size, but whose numbers make up for their apparent feebleness. Upon the Peach occur several species of aphids, and the one supposed to be the particular pest of the Peach, and also of the Nectarine, has been named *A. Persicæ*. It is certainly the most conspicuous of all, and frequently causes the leaves to curl and droop. Sometimes, however, the effects of the fungus that has been styled by Bradley *Exoascus deformis*, has been confounded with the work of this aphid, since its mycelium makes the foliage to swell or become mouldy. *Aphis Persicæ* is usually about the first of the aphid tribe to appear. The eggs, which are scattered singly, cannot be detected without great difficulty, but as they are deposited by the autumn brood of winged fly, effective measures for the clearance of these, when noticed on the twigs as the leaves are falling, will lessen the succeeding brood of aphides, and by well cleansing the trees before the spring with one or other of the washes recommended for the general destruction of lurkers most aphid eggs can be disposed of. This

Fig. 19.—*Tortrix Wæberiana*.

species is dull yellow or red, paler while young, with green antennæ; in the winged form brown or even black, but variable, wings large. It may appear as a winged insect early in May, about which time it deposits freely a sweet secretion that clogs up the pores of the leaves. The ground body of one of these, examined by a magnifier, looks as if full of globules of oil. Fortunately it is devoured by several species of insects, and is much visited by a small parasitic fly, a black-bodied Cynips. Of this and other Peach aphides there may be nearly twenty generations during one season.

Both Peach and Apricot afford a food and home to *A. Pruni* in all its stages, but it occurs even more plentifully upon other fruit trees than upon these. Rapid in multiplication like the preceding, it also resembles *A. Persicæ* in its habit of throwing off a clogging liquid, the influence of which, joined with that of the irritation of constant punctures, curls up the leaves, thereby giving an agreeable shelter to the aphid hosts. The young *A. Pruni* are greenish yellow, and very transparent as they increase in size. The eggs can be discerned within the body looking like tiny dots. When winged, this species has the body powdered with a cottony exudation, the females being light-brown or greenish, the males darker; both sexes show short suckers and antennæ. These insects may be seen on the trees after all the leaves have fallen. Then *A. Rumicis*, a species of general distribution, is seldom minus its representatives on the Peach, though it may not succeed in stripping that tree of its leaves, as it will sometimes strip the Pear, because the former is less likely to be neglected. In shape this aphid is almost globular, the thorax and abdomen having no distinction of parts. In the juvenile stage of a lighter grey it becomes nearly black when adult. For all these species, should they appear in houses, there does not seem to be a better remedy than tobacco fumigation, the paper being damped so as to produce a thick smoke. Out of doors our plan must be syringing or washing, but whatever be the nature of the compound selected, unless the aphides are very small, it will kill only a few if it contains nothing of a soapy character to make it adhere to the skins of the insects.

Several species of scale or coccus, a well-known example of which is popularly known as the brown scale, are apt to swarm upon Peaches which have not been attended to during the winter

season, but they are easily suppressed by suitable applications used at a time when the branches can be brushed as well as washed. The solution of petroleum, with soap or soda, applied at a temperature of 130° answers well enough, though some rely upon a sulphur wash for the extirpation both of scale and thrips. And when the scarlet scale or mealy bug (*Coccus adonidum*) has got into a Peach house it is difficult to eradicate, since the pest spreads itself over the woodwork and lurks in the crevices of walls. It is a largish species, occasionally confounded with the American blight, which is certainly like it in the circumstance of having an outer garb of woollen. Protected by this the shield-like female insect keeps quiet, and apparently lifeless through the winter, to deposit, if undisturbed, a numerous batch of eggs in early spring. Now and then we observe on the Peach or Nectarine the curious little mussel scale of the Apple (*Aspidiotus conchiformis*). Of the prolific genus thrips we see two species upon the Peach and its allies, both injurious; one is a dingy black with yellow legs and white wings, the other is a yellowish brown insect, as small but rather slimmer than its relative. The power of springing which they possess aids them to distribute themselves over a tree, and "keeping them low down," which has been advised, does not prove very feasible in practice. Those atmospheric conditions that favour the increase of thrips also suit the red spider, which is often in its company under glass, and requires to be dealt with similarly.

Reserving till we treat of the Apricot some other insects that are common to it and to the Peach, we may mention here the Wabarian moth (*Tortrix Wabariana*), the presence of which in the larval state is indicated by small heaps of dust upon the bark. When this is removed a furrow is perceptible, in which the larva feeds and occasions a flow of sap, the consequence being that the tree is much weakened should the insects be numerous. This small but pernicious caterpillar feeds through the greater part of the year; it is dull green and red-headed. The moth, which is brown with silvery and golden marks, sits upon the bark in May or June, and while the wings are folded the eye hardly distinguishes it. The moth is represented in fig. 19.—ENTOMOLOGIST.

ANTWERP INTERNATIONAL HORTICULTURAL EXHIBITION AND CONGRESS.

AUGUST 2ND TO 6TH.

THE present season has been an exceptionally busy one in the commercial capital of Belgium owing to the great Exhibition there held, and an excellent opportunity was thus afforded for a series of horticultural shows such as has never been held in Antwerp before. The principal event was, however, that fixed for August the 2nd to 6th, and which was publicly opened on Sunday last. To render this still more memorable it was also decided to hold an international botanical and horticultural congress in connection with the Exhibition, and a number of invitations were sent to the chief horticulturists and botanists of Great Britain and other European countries. The British contingent comprised several well-known persons, amongst whom may be specially mentioned Professor Thistleton Dyer, Royal Gardens, Kew, and Dr. Robert Hogg, who were appointed to represent the Royal Horticultural Society both at the Jury and the Congress.

To many who were induced either by business or pleasure to make the journey to Belgium the selection of an agreeable route became a matter of considerable importance, and as there is a choice of several there was necessarily a diversity of opinion as to their respective merits. Having, however, the opportunity of starting a week in advance of the Show the commencement of the day service between Harwich and Antwerp by the Great Eastern Company afforded a most convenient mode of reaching the Continent. For many years this Company has had an excellent service of boats at night, which to commercial men is very advantageous, as leaving London at 8 P.M. Antwerp is reached by 9 or 10 the next morning, and no time is thus lost in travelling. To accommodate those, however, who are not quite so pressed for time or who prefer voyages by day, the Company decided to institute a service twice a week from London to Antwerp and *vice versa*, the outward journey being performed on Wednesday and Saturday and the homeward on Tuesday and Friday. The first journey was made on Saturday, the 25th July, by the handsomely fitted boat, the "Adelaide," and by this we made our trip across the German Ocean in remarkably fine weather. Starting from Liverpool Street at 9 A.M., a quick run conveyed the passengers to Harwich in about an hour and a half, from which the "Adelaide" departed punctually at 11 A.M. A slight breeze and an unclouded sun, with the sea as calm as a lake, rendered the journey all that could be desired, and it was almost with a feeling of regret that the majority of the passengers sighted land shortly after four in the afternoon. Passing along the coast of Belgium within an easy distance of the shore, Blankenhergh and several other rising watering places were readily seen, and by 6 P.M. the mouth of the Scheldt was reached, the boat stopping a few minutes at Flushing to take a river pilot on board. An excellent dinner was then served in the saloon, and when the passengers again ascended to the deck we were far up the river. The Scheldt is not an interesting river; its low banks and the flat country on each side being exactly of the distinguishing Netherland character; it therefore afforded much satisfaction to all when the long, brightly lighted quays of Antwerp came in sight about 9.30 P.M. By this time the moon was shining brightly, and the lofty handsome tower of the Cathedral was a prominent object in a very pretty picture. We were soon alongside the South Quay, where the Great Eastern Company's boats are secured, and

a great bustle ensued, passengers hurrying off to their hotels, the Customs officers busily examining the luggage, porters and cahmen eagerly soliciting patronage. The Company had, however, wisely arranged that all passengers who wished could secure berths on board on the night of arrival, and this was taken advantage of by many who wished to avoid the trouble of searching for rooms at a late hour, especially as the town was unusually full owing to preparation for the great fête on the next day—the opening of the new quays by the King. A refreshing sleep in a comfortable berth concluded a most pleasant day's journey. The next morning we were prepared for the great event which attracted so many thousands of home and foreign visitors to the busy and interesting old city. Concerning the events of that day, and a series of visits to the horticultural establishments at Ghent and elsewhere our notes must be reserved, for the Horticultural Exhibition now specially demands attention.

THE HORTICULTURAL EXHIBITION.

When the Jury assembled on Saturday, August the 1st, the pavilion devoted to the horticultural exhibits presented a beautiful sight, and constituted one of the grandest displays of foliage plants that has ever been provided, even on the continent, where foliage plants are so extensively grown. The pavilion is a lofty building adjoining the International Exhibition, about 300 feet long and 180 wide, with three spacious annexes, the whole of which were fully occupied with the plants in competition or otherwise. The majority of the 132 classes provided in the schedule were represented, and in some the competition was very close, for the good-natured rivalry prevailing between the Belgian nurserymen induces them to try their utmost at shows of this character, the result of which is that visitors can obtain a good idea of the skill of the horticulturists and the extent and variety of their collections. Perhaps the most striking feature at such an exhibition to those familiar with British shows is the informality of the arrangement, and in that respect they unquestionably surpass us, though in other matters, especially in making known the decisions of the Judges, we are much more expeditious. The exhibition is first prepared for the Jury, as it was on Saturday. These gentlemen perform their duties, and in the afternoon an official, with a large staff of assistants, takes charge and re-arranges the exhibits to facilitate the entrance of visitors, and to produce a better general effect, and this work was not completed until midday on Sunday, during which time all persons are rigidly excluded, so that a day and a half elapses from the time the Jury made their awards until the prize cards are all affixed, and then the public are admitted. For shows extending over five or six days this plan may be suitable, but in our exhibitions we have to get through the work much more quickly.

Considerable taste is, however, exercised in the arrangement of the exhibits, and this compensates to a great extent for the delay which occurs. Around the sides of the pavilion were disposed the groups of foliage and miscellaneous plants, while in the centre were placed the groups of flowering plants that imparted a most welcome colouring to the effect. Few who are only accustomed to our comparatively small displays of foliage plants could imagine the beauty that can be produced by the varied collections grown by Belgian horticulturists. In Palms alone a dozen or twenty species and varieties are rarely seen together at one show in England. At Antwerp there must have been some hundreds at least, and differing largely in their leaf characters, from the huge leaves of the *Verschoffeltia* to the most graceful of the *Cocos* or *Arecas*, there was every intermediate form. *Dracenas*, too, were very beautiful, highly coloured, or with clearly variegated foliage, and of all sizes, from specimens suitable for the table to others 5 or 6 feet high, and clothed with foliage to the rim of the pots. Some well-coloured *Crotons* were also noticeable, but these are frequently better shown at London exhibitions. Very distinct characters were imparted by the numerous *Marantas* and *Bromeliads*, the last-named being exceedingly fine, and several enormous plants of *Billbergia* and *Vriesias*, especially of *V. Hillebrandiana*, with channelled leaves 4 or 5 feet long, were very striking. Pitcher Plants, particularly *Nepenthes*, were also strongly represented, Orchids and new plants forming departments of great interest and beauty, while smaller collections innumerable of Lilies, *Pelargoniums*, and *Roses*, all assisted in furnishing the Show. Conspicuous amongst the latter were eight fine boxes from Messrs. Souper et Notting, Luxembourg; and Mr. Charles Turner, Slough, contributed sixty superior blooms of *Carnations* and *Picotees* that were greatly admired.

When the arrangement of the Exhibition was completed for the opening by the Minister of Agriculture on Sunday at mid-day the general effect was grand. The groups had been placed closer together, or slightly altered where necessary, with considerable taste, and they were all margined with a neat white wicker edging about 1 foot deep, which gave a most pleasing finish. The paths were widened so as to allow free passage in every direction, and the visitor could wander about, almost imagining himself in some grand tropical garden where all the choicest vegetation of the globe had been collected together for his delectation. The plants were placed upon the floor, no staging being employed except in the two annexes, which contained the *Nepenthes* and Orchids, and these were suitably draped. In the principal pavilion, however, there were no formal lines of tables such as are too familiar in English exhibitions, and the whole plan was as artistic in design as it was complete in the execution.

GROUPS AND COLLECTIONS OF PLANTS.

Considerable space in the pavilion was occupied by groups, the majority in competition; but some that were contributed out of the classes also added greatly to the extent and attractions of the display. These cannot be taken in detail, but the more important will be mentioned, and foremost honours must be accorded to Madame La Grelle-Dhanis, Berchem, Ghent, who had an extraordinary number of large specimen plants, all in excellent health, and giving satisfactory evidence of the best culture. The Jury very fittingly recognised the importance of this lady's exhibits by awarding her the gold medal offered by the town of Antwerp to the amateur who contributed most to the beauty of the Exhibition. Several of these groups were arranged together on one side of the pavilion, and formed the grandest bank of specimen plants that we have ever seen from one amateur, and Antwerp has every reason to be proud of its distinguished exhibitor. Gold medals were also awarded as first prizes in each of the following classes, in which Madame Le Grelle-Dhanis was the principal exhibitor:—A superb collection of fifty species or varieties of plants

flowering or foliage, gained for Madame Le Grelle the first prize of a gold medal, but the majority of the specimens were foliage plants; Marantas, Pothos, Anthuriums, Dieffenbachias, a grand specimen *Licuala grandis*, and a highly coloured *Heliconia aurea-striata* being the most noticeable. M. Moens, Lede, Antwerp, was placed second, and awarded a gold medal in this class for a very handsome group, in which *Maranta Warneri*, *Cycas siamensis*, *Tillandsia tessellata*, *Alocasia Sanderiana*, with Palms and Cycads, figured conspicuously. M. de Hemptinne, Ghent, was third with a varied and attractive group. The class for twenty-five species of ornamental plants comprised some very large Palms of many species, but the most remarkable plants were *Zamia Leyi*, with shining green graceful leaves 8 feet in length; *Aralia heteromorpha*, 12 feet high and in vigorous health; *Hæmalonema marantæfolia*, a handsome variegated plant, and *Phormium variegatum*, large and finely coloured. A similar award was granted for a collection of Marantas, which included all the finest varieties of these plants in cultivation, some plants, as *Kegeliana*, being 8 feet in diameter, with fresh healthy foliage, which in this form is very distinctly marked with green blotches on a silvery ground. Other good varieties were *Makoyana*, *Wagneri*, *vittata*, *Buchemiana*, *Porteana*, and *Kerchoveana*. A collection of Crotons from the same exhibitor were by far the best coloured in the Show, such forms as *Morti*, *magnoliæfolius*, and *Baron de Rothschild* being superb. A handsome collection of thirty species of Ferns, also from Madame Le Grelle-Dhanis, included good plants of the best *Adiantums* and *Gymnogrammas*, an uncommonly fine example of *Acrostichum squameum*, with white downy leaves an inch or two in diameter and 6 to 10 inches or more in length, forming a most effective central specimen. The twenty-five variegated foliage plants comprised some handsome *Dieffenbachias*, a particularly fine *Alocasia metallica*, with large superbly coloured leaves, a gigantic *Monstera deliciosa*, with *Pothos aurea*, *Cyrtodeira fulgida*, *Schismatoglottis Robelini*, Cycads, and Palms. These fine groups formed the greater part of the exhibits from Madame Le Grelle-Dhanis, and well deserved all the honours they obtained.

Next in order of the principal exhibitors came Mr. Louis Van Houtte, Ghent, who well maintained the high credit of the firm with a series of magnificent groups and collections, for which a gold medal of 200 francs was awarded as the most important contribution from nurserymen. The most important of these was the premier group of fifty species or varieties of plants, in which Mr. Van Houtte entered some of the best of his plants, deservedly winning the gold medal. In the centre of the group was an extraordinarily grand specimen of *Anthurium Veitchii* with about two dozen fine leaves 5 feet long, and of that peculiar rich green which distinguishes this handsome form. Another notable plant was *Dieffenbachia imperialis nobilis*, with large very dark green leaves spotted with a lighter shade—a most effective and strong-growing variety. *Licuala grandis*, 4 feet high and with thirteen leaves, was very handsome; *Zamia Mitcheli*, an elegant form with graceful leaves, the pinnae very narrow. A grand *Verschaffeltia splendida* was prominent in the centre behind the *Anthurium*, and other notable plants were *Schismatoglottis Robelini*, *Dracæna Lindenii*, *Cyanophyllum magnificum*, *Tillandsia tessellata* (very handsome), *Sphærogyne latifolia*, *Aralia Chabrieri*, *Anthurium Laucheum*, *Washingtonia robusta*, and *Phyllotanium Lindenii*. The second prize in this class (also a gold medal) was awarded to MM. Jacob-Makoy, Liege, who had an admirable group, comprising large handsome specimens of distinct plants. Very notable was a central specimen of *Eugenia glazioviana* over 6 feet high, an uncommon species with closely set leaves rather suggestive of *Boronia serrulata*, graceful in habit, the branches slightly drooping. *Vriesia Hillegeriana* was remarkably bold-looking; *Oreopanax dactylifolium*, with deeply and irregularly cut leaves, was distinct. *Maranta Lindenii* was in uncommonly fine condition. *Alocasia Putzeyi*, a handsome plant in the way of *A. Thibautiana*, was noticeable; as were also *Anthurium macrolobum*, with large irregular lobes, very bold and distinct; *Dracæna Massangeana*, tall and well variegated; *Anthurium roseum*, like a light-coloured *A. ferrierense*; and a fine pan of the bronze-coloured *Liparis elegantissima*, formed the chief features in this praiseworthy group.

Mr. Van Houtte was again the premier exhibitor in the class for twenty-five variegated foliage plants, which comprised magnificent examples of the following amongst many others of slightly smaller size, but scarcely less beautiful:—*Dieffenbachia magnifica*, *Alpinia vittata*, *Curculigo recurvata* variegata, *Maranta picturata*, *Dracæna Lindenii*, *Tillandsia fenestralis*, *Pothos anrea*, *Pandanus Veitchii*, and *Phyllotanium Lindenii*. A very close second in this class was M. A. D'Haene, Ghent, who had some well-grown plants, one of the most striking being a specimen of *Bertolonia Van Houttei*, which was in superb condition, the handsome foliage grandly coloured.

Nepenthes were shown by several exhibitors, and the leading collections were extremely fine, especially the dozen with which Mr. Van Houtte gained the first prize, a gold medal. These plants were all in vigorous health, and bearing in some cases several dozen pitchers, such forms as *Mastersi* and *sanguinea* being very highly coloured. The dozen comprised, in addition to the two named, *Hookeriana*, *hybrida maculata*, *Dominiana*, *Chelsoni*, *Outramiana*, *hybrida*, *Courti*, *intermedia*, *Wrigleyana*, and *Veitchii*. A first prize was also awarded to M. P. F. Boutmans, Lille, for a well-grown collection, the three finest plants being *Mastersi* with sixteen pitchers, leaves over 5 feet high with several dozen pitchers, and *ampullacea* similarly good. For a collection of miscellaneous Pitcher Plants, including *Nepenthes*, *Sarracenias*, and *Dionæas*, M. P. F. Boutmans was first, showing *Sarracenias flava*, *Tolliana*, *Swanniana*, and *Maddisoniana* in excellent condition. *Nepenthes Mastersiana*, *Morganæ*, *phyllamphora*, with two or three dozen pitchers, and *Dionæa muscipula* were all healthy plants. MM. Jacob-Makoy followed with *Darlingtonia californica* (very strong) and *Nepenthes Mastersiana* bearing eight large richly coloured pitchers. M. Van Houtte also exhibited new plants, as noted elsewhere, and in several other classes gained honours.

A gold medal was also awarded to M. A. D'Haene, Ghent, for the extent and beauty of his numerous groups, an honour which was extremely well merited; for all his plants were distinguished by a vigorous health that is indicative of the most skilful culture. M. D'Haene also has a rich collection of plants that is fast increasing in importance, and includes many choice and beautiful species and varieties, several of which were represented at the Show. M. D'Haene's courtesy as an official in connection with the Exhibition also deserves record, for he most willingly gave English visitors

all the assistance in his power, which proved most valuable in several difficulties.

NEW PLANTS.

An important and interesting feature in the Show was the large number of new plants exhibited, many of which were of recent introduction, and have not yet found their way to English gardens. As in the other sections the foliage plants predominated, and among them were several very striking novelties. The principal class, the first in the schedule, was for twenty-five new plants introduced into Belgium since 1882, the prizes being a gold medal offered by the King, a much-coveted honour, and a second-prize gold medal, value about £5. Three competitors entered, and the leading position was, after careful consideration, awarded to MM. L. Jacob-Makoy & Co., Liege, for an admirable collection of well-grown plants, representing the following:—*Philodendron Mamei*, a neat Aroid; the leaves 12 inches long by 8 wide, and irregularly blotched with white; introduced from Ecuador, 1883. *Selaginella cognata*, one of the frondose forms, with pretty, closely branched fronds of a bright green colour. *Caraguata Peacocki*, a bold Bromeliad, with channelled leaves 12 to 16 inches long and 1½ inch broad, curiously coloured with an intermixture of rosy purple and green; Brazil, 1885. *Odontoglossum vexillarium Wioti*, a white-flowered variety of good size and form. *Dichorisandra Sieberti*, leaves 15 inches long by 4 wide, oblanceolate, green, with white streaks; an elegant plant; Brazil, 1884. *Pandanus discolor*, chiefly distinguished by the brownish purple tint on the under side of the leaves, which were 2 to 2½ feet long; India, 1884. *Schismatoglottis decora Witteana*, a pretty variety, with heart-shaped leaves 4 inches long and 3 inches wide, matted with green and silvery white, of dense habit, and apparently well suited for growing in large pans in the stove; Borneo, 1885. *Alocasia Bernardi*, somewhat suggestive of *A. Veitchii* in shape, the leaves 12 inches to 2 feet long and 10 inches broad, green with silvery veins; a bold, handsome plant; Borneo, 1885. *Hoplophytum robustum variegatum*, an attractive variegated plant, introduced by the exhibitor from Brazil this year. It has narrow leaves, about 1 inch wide, but 18 inches or more in length, curving, and streaked from base to point with clear white. *Aralia Kerchoveana*, a strong but graceful species, with palmate leaves of ten deeply serrated leaflets, bright shining green in colour; South Sea Isles, 1883. *Carludovica rubricaulis*, a distinct Palm, with leaves 2 to 2½ feet long, divided into two lobes; the stalk of similar length, but the plant did not show the character indicated by the name. Introduced by MM. Jacob-Makoy from New Grenada, 1885. *Piper ornatum*, leaves cordate, green, with a silvery mottling and a slight rosy tint, a pretty form that will probably become a favourite stove plant. It is an introduction from Malacca this year. *Dieffenbachia Jenmani*, leaves light rich green, with parallel bars of white; a distinct effective form from British Guiana, 1884. *Caraguata Osyana*, a closely spreading Bromeliad, with green leaves, the centre leaves and bracts bright red, very showy; Ecuador, 1885. *Brochinia demeraraensis*, a bold Bromeliad, with leaves 3 to 4 feet long and 6 to 8 inches broad, light green, very strong in habit, and most effective; introduced from British Guiana by the exhibitor, 1885. *Alocasia Sanderiana*, sagittate leaves, dark green, with silvery veins and an irregularly sinuated silvery margin. *Cryptanthus Regeli*, a curious Bromeliad, with dull yellow and dark green mottled leaves, dwarf in habit; Brazil, 1885. *Alocasia Van Houttei*, bold bright green leaves, 2 feet long by 18 inches wide, heart-shaped, very strong, the petioles curiously mottled. *Leea amabilis splendens*, a highly coloured form of this handsome stove plant, which is now well known in England. *Maranta speciosa*, leaves elliptical, 6 inches long by 4 wide, green, with silvery streaks, a pretty introduction from Brazil by MM. Jacob-Makoy. *Croton Wetterianum*, leaves dark green, with a gold centre, scarcely in character, but appears distinct. *Kæmpferia Gilberti*, an elegant variegated plant, with narrow leaves, green, edged with white or yellow. *Philodendron Sodiroi*, a showy growing form, with leaves 12 inches long by 10 wide, green, with a slight silvery hue, introduced by the exhibitor from Ecuador, 1883. *Nidularium anethocates*, very distinct, the leaves broad and comparatively short, not exceeding a foot in length, the outer green, but the inner ones of a purplish violet tint; introduced by the exhibitor, Brazil, 1884. *Dieffenbachia reginæ*, leaves spotted and margined with green on a white or yellowish ground; a bold, handsome, and distinct plant.

M. Louis Van Houtte, Ghent, was awarded the second prize, a gold medal of 100 francs, also for a very fine collection, of which the following deserve special notice:—*Heliconia aureo-striata*, leaves veined with gold on a green ground; *Anthurium Schmidtscheni*, leaves heart-shaped, bold, 2 feet long by 1½ foot broad, bright green, with a velvety surface; *Massangea hieroglyphica*, leaves 12 to 18 inches long, 2 to 3 inches broad, bright green, with darker transverse bars, pretty; *Pandanus d'Haenei*, a species from Madagascar, with glaucous leaves and slight darker mottling, the dried leaves shown with the plant in another collection being 9½ inches wide by 4½ feet long; *Nepenthes Mastersi* had several good pitchers; *Phoenix gracillima*, a graceful Palm with narrow pinnae, something in the style of the *P. dactylifera* section; *Alsophila Rebeccæ*, a handsome Fern with pinnate fronds, the pinnae regularly undulated; *Philodendron Sodiroi*, already noted; *Pritchardia grandis*, with three fine leaves about 18 inches in diameter; *Alocasia Sanderiana* and *Dieffenbachia Jenmani*, both in the preceding collection; *Nidularium Echantei*, a fine Bromeliad with green channelled leaves margined with red; *Gymnogrammaschizophylla gloriosum*, a strong growing variety of this beautiful Fern, with fronds 2 feet long, drooping round the pot and quite hiding it; *Anthurium Gustavi*, leaves heart-shaped, green, 3 feet by 3, a magnificent Aroid, with five of the grand leaves, a most distinct and effective plant; *Piper ornatum*, *Alocasia reginæ*, *Dieffenbachia magnificum*, *Tillandsia Pastuchoffiana*, a handsome plant of good habit, the leaves channelled, 2 feet long by 3 inches broad, with dark green lines irregularly distributed over the surface, mostly transverse, but some longitudinal; *Schismatoglottis crispata*, *Anthurium splendidum*, *Selaginella grandis*, *Aglaonema picta*, *Heliconia metallica*, something like a *Canna*, the ribs and under surface reddish; and *Alocasia Van Houttei*.

M. Auguste Van Geert, Ghent, was third with the following plants, most of which have been noticed in the preceding collections:—*Pandanus d'Haenei*, *Panax Victoræ*, *Cyclanthus discolor*, *Alocasia reginæ*, *Dichorisandra Sieberti*, *Kæmpferia Gilberti*, *Pandanus discolor*, *Leea amabilis splendens*, *Alocasia Van Houttei*, *Nephrolepis Bausei*, and *Ptychocheilima Van Geerti*.

For six new plants MM. Jacob-Makoy & Co. were again the premier

exhibitors, showing several of similar character to those previously noted—namely *Dieffenbachia gemmata*, *Cryptanthus Lubbersi*, *Maranta Arreata*, *Alocasia Closoni*, *Dieffenbachia aureo-variegata*, and *Kaempferia spectabilis*. Mr. D'Haene had the best three new plants—*Pandanus D'Haenei*, *Croton Roetzlii*, with small elliptical leaves, yellow, red, and dark green, and *Pinanga kentiaeformis*, with pinnate leaves, the pinnae 1 to 2 inches broad, of strong habit. MM. Jacob-Makoy & Co. followed with *Schismatoglottis rotundifolia*, *Hoplophytum robustum variegatum*, a pretty variegated plant, the leaves streaked with green and white, and *Anthurium loricatum*, leaves triangular, dark green, velvety surface, very distinct and striking. Several other classes were devoted to new plants, M. Auguste Van Geert winning the leading prize for twelve new and rare Palms with a good collection, a few other exhibitors also showing single specimens.

ORCHIDS.

Several collections of these were staged, but the competition in the classes was not strong, and two of the best collections were those from Messrs. Peeters & Vuylsteke. There was only one collection of fifteen Orchids from an amateur, M. Cannart d'Hamale, Malines, who had some well grown plants, his *Vandas* being especially fine, and the collection of Orchids at Malines is famous for the large plants of this genus. *V. suavis Lindeni*, 7 to 8 feet high, had three fine spikes; *V. suavis* (Veitch's variety) had two spikes of ten flowers each, richly spotted, and *Vanda tricolor insignis* had two good spikes. Other notable plants were *Calanthe veratrilifolia*, with twelve spikes; *Epidendrum vitellinum*, twelve spikes. *Cypripedium Veitchii*, *C. Lawrenceanum*, and *C. barbatum superbum* were all good, the latter with forty flowers, and a specimen of *Oncidium superbium* had two large panicles of flowers. All these plants were in excellent health, and as fresh as could be wished by the most fastidious of orchidists. The same remark would also apply to the twelve *Cypripediums* with which Mr. Heye-Leysen, Ghent, gained the chief prize, for they formed a most creditable group, and were selected from a collection of ninety-three species and varieties, the exhibitor having made a speciality of the genus. Those represented were *Veitchianum*, seven flowers; *Lawreanum*, supercilare, *marmorophyllum*, *cananthum*, *Hookerae*, *Stonei*, *Ashburtoniae*, *Parishi*, *barbatum*, and *selligerum*.

An honorary gold medal was adjudged to M. Peeters, Brussels, for a large and handsome group of very choice and well-grown Orchids, one of the most notable of which was a plant of the beautiful *Cypripedium Morganiae*, with six flowers, the first which have opened in Belgium. *Phajus Humboldtii*, a pretty rosy flowered species, with a yellow blotch in the centre of the lip, had a spike of ten flowers, and was much admired. Numerous *Cypripediums*, *Odontoglossums*, and *Oncidium*s made up the bulk of the group; but there was a remarkable plant of *Cattleya guttata Leopoldi*, with a dense massive spike of about forty flowers, one of the finest we have seen. The pretty white *Dendrobium Dearei*, the rosy crimson *Phalenopsis Esmeraldi*, the bright yellow *Anguloa Clowesi*, with *Masdevallias*, *Disas*, and many others, constituted a group of exceptional merit, and proved how well the culture of Orchids is understood in Belgium, and the crowd of visitors round it on the opening day also showed how the popularity of these plants is extending. M. Vuylsteke was also awarded a medal for a collection chiefly composed of *Odontoglossums*, but containing a wonderful specimen of *Acineta Humboldtii*, with three spikes of ten dull red-spotted flowers.

Notes on several other classes, especially the *Bromeliads* and *Palms*, must be reserved for another week, and it can only now be further added that some of the principal exhibitors, in addition to those already mentioned, were—MM. Wartel Frères, De Griet Frères, Pynaert Van Geert, M. Dalliere, M. Spaë, M. Pauwels, M.M. Wallem fis, and M. Everaerts. Special awards were also granted to the *Compagnie Continentale d'Horticulture*, Ghent, for some extremely fine specimen *Palms*; to M. Van den Wonwer for a large group of miscellaneous plants, most tastefully arranged, and containing numerous handsome specimens; and to several other exhibitors for single plants or small groups.

Upon the opening day the Exhibition was crowded with visitors and there was also a good attendance on the succeeding days. The Banquet was held on Sunday evening at 6 p.m., and was attended by nearly all the Jury present at the Exhibition—over 100. The English representatives were Professor W. T. Dyer, Shirley Hibberd, Dr. R. Hogg, T. Rivers, and H. Turner; about a dozen others who were invited not being present.

THE BOTANICAL AND HORTICULTURAL CONGRESS.

There was a large attendance of the members of the Congress at the opening on Sunday at 10.30 in the Grand Hall of the Cercle Artistique, Rue d'Arenberg. Dr. Baillon of Paris made an interesting speech in announcing the programme and work for the Congress, and there were several notable personages present. During the afternoon a visit was paid to the celebrated Musée Plantin, when each member of the Congress was presented with a souvenir printed from the old type and on hand-made paper. For Monday, Tuesday, Wednesday, Thursday, and Friday a very complete programme was drawn up, which included, besides discussion upon a variety of botanical and horticultural subjects, visits to the principal places of interest in Antwerp, Ghent, and Brussels. The weather proved fine, not quite so hot as in the previous week, and the visitors were thus enabled to more thoroughly enjoy their short period of residence amongst a most hospitable and enterprising people.

SAWBRIDGEWORTH IN JULY.

In a great emporium of fruit trees such as the world-famed nurseries of Messrs. Thomas Rivers & Son, there is something worth seeing at all seasons of the year; in winter, methods of pruning, and the results in bristling buds; in the spring a magnificent display of blossom, really a grand undulated flower garden upwards of 150 acres in extent; in summer a wonderfully diversified collection of fruit, both as regards variety and the differing forms of trees. Hardy fruits of all kinds, trees nearly all sizes, from orchard standards in bearing to heavily laden pyramids and bushes, cordons double and single, horizontal, vertical, and

oblique, with forests of maidens, are all represented. Then under glass the miniature orchards of Peaches, Nectarines, Cherries and Oranges cannot fail to arrest attention; and not less so the long ranges devoted to the culture of Vines in pots and Vines in bearing, all of which will bear the most critical inspection, for the canes and the crops are of the first order of merit, representing, as they undoubtedly do, high excellence in cultivation, while in addition to these there is in July a great feast of Roses, the soil evidently being as suitable to these flowers, conducting both to sturdiness of growth and brilliancy of colour, as it is to the production of fruitful trees and superior fruit. The soil is a calcareous loam, medium to strong in texture, and contains distinct traces of iron, and this soil, with the full exposure, incites not sappy but sturdy growth, which appears to ripen as it is made, imparting to the trees early and marked fertility. Sawbridgeworth, then, both as regards soil and position, possesses great natural advantages for fruit culture, and when to this is added the aggregation of professional skill through three or four generations of Rivers', something good may reasonably be expected, and a great deal that is excellent is produced. The nurseries are continually expanding, field after field being added, and if the progress continues, as no doubt it will, 200 acres will soon be covered with trees. It will be convenient and perhaps not uninteresting to refer briefly to the leading departments.

PEACHES AND NECTARINES.

These are grown in pots mainly, but some, that may be termed standard orchard trees, are planted out in great plain glazed structures, wooden sheds they may be termed, roofed with glass, with wide side lids for ventilation, and ventilators next the ridges over the doors at each end of the houses. That this provision for changing the air suffices is evident by the condition of the trees, for they are as healthy as can be imagined, nourish no red spider, but perfect abundant crops of superior fruit. The soil in which the trees are planted is as hard as a floor could be made with rammers, those in pots having similarly firm soil, and top-dressed with kiln dust and horse-droppings saturated with liquid manure. There is no better material than this for the purpose, and it will, perhaps, on a future occasion be more fully referred to, as many persons have procured and used the wrong material—the dried sproutings of barley from the germinating chambers of malt kilns, which is not "kiln dust" as used by Mr. Rivers and other persons who know what they are about.

With the exception of two American varieties, the Alexander and Hales' Early, the best early and late Peaches in cultivation have originated in the establishment under notice, and delicious fruits can now be gathered without forcing yet with the aid of glass, from the middle of July till November. Alexander was gathered in the middle of July, and Early Beatrice was being gathered daily—a fine crop of medium-sized highly coloured and delicious fruits; Early Louise, Hales' Early, Early Rivers (pale, but good), and Rivers' Early York following closely in succession; then follow the Condor and Dr. Hogg, Early Grosse Mignonne, all good in colour and quality, with the old favourites Grosse Mignonne, Royal George, Noblesse, Bellegarde, and others not sufficiently known, such as Goshawk, Sea Eagle, and the Princess of Wales, and Gladstone, all of the first size and quality. They are worthy of trial wherever convenience is afforded. The yellow-fruited American Peaches are good in appearance, but there is no certainty of their flavour being developed in this country. Pyramid trees, from 6 feet to 9 feet high in the houses, are very handsome when laden with fruit, and numbers are bearing at half that height. Thousands of trees are prepared in pots either for shifting into larger or planting out as may be desired, and, well managed, are certain to bear freely, for they are studded with blossom buds.

Great attention is given to Nectarines, in fact this fruit has been practically revolutionised at Sawbridgeworth, and it is only right to say by the present proprietor, Mr. T. Francis Rivers, from careful fertilisation in his younger days, and years of patient waiting and testing, for varieties are fruited for years before the public hears anything about them. The earliest of all Nectarines is Advance; it is of medium size and superior quality. Then comes Lord Napier, an excellent grower and bearer of large fruit, which well produced is quite first-rate in quality, and, exposed to the sun, good in colour. It may be fairly described as one of the most valuable Nectarines ever raised. Then follow Stanwick Elruge, and the poets' Nectarines—Byron, Newton, Milton, and Spenser, all fine—the last-named wonderful in colour, with Albert Victor, Pine Apple, and Victoria, the excellence of which will be admitted when produced in good condition, and they are all good growers and bearers. All these are natives of Sawbridgeworth, as are other good sorts, but only one can be mentioned, the new Goldoni, that has recently been certificated. It is quite distinct in every way, brilliant in colour, orange scarlet, and exceedingly rich; the tree is, moreover, a free grower and bearer, and the fruits are of good size. Its merit has been severely tested, and now it is introduced to the public. Let it have a fair trial. Of this it is worthy, and it is not likely to disappoint. Possibly the name, that of an Italian poet, expressive also of the colour of the fruit, may have led some persons to imagine this variety to be of continental origin. Something to that effect having reached Mr. Rivers, he has put the matter right in the following historical note.

"The 'Goldoni' Nectarine is rather mixed in its parentage. It is a seedling from a stone of a seedling white Nectarine which was raised from a stone of the 'Galande Noire' Peach. The register of these successive seedlings is carefully kept. The seedling tree is here in a cool orchard house, where it ripens about the 28th August. I have tested it for some years, and have not introduced it until I was quite sure of its high excellence. Rumour in this case is a 'false thief.' There are a very

few continental Nectarines worth eating." That is conclusive, and very fittingly closes these notes on Nectarines.

CHERRIES.

The Cherry house at Sawbridgeworth is as plain and cheap a structure as can be imagined. It is a long span-roof, 12 feet wide, with boarded sides about 4 feet high, with a continuous ventilating shutter about 2 feet wide, but nearly always open, the space being covered with fixed wire netting for excluding birds. There is a path down the centre and two rows of trees in large pots plunged in the borders on each side—in all four rows. They bear prodigiously, and such fruit is rarely seen. It is splendid in size, fruits of the *Géant de Heltinghem* being nearly 4 inches in circumference. It is also superior, as others are in quality, all far surpassing fruit ripened in the open air, and it is not surprising the examples at the Royal Botanic Society's Show tempted the Royal visitors, who "never tasted such Cherries before." There is a new treat in store for persons who may decide to grow such Cherries as these, as thousands may do, and by a good selection of varieties may have handsome dishes for three months. It is passing strange that a Cherry house is not erected in any otherwise well-appointed garden where choice fruits are cherished. As an example of the productiveness of the trees a bunch of the *Early Rivers* is illustrated first. It is not adequately represented, as it had necessarily to be reduced. It was a fine cluster of between sixty and seventy superior fruits of one of the most valuable Cherries in cultivation. Other superior varieties are accurately described in the catalogue of the firm, and need not therefore be enumerated here. No structure in the establishment gives greater satisfaction to the proprietor than this plain and profitable house of Cherries. It is not heated.

VINES.

The extensive and successful culture of Vines in pots in this nursery is widely known. Year after year the rows of pipes running along the front of long low houses form the base for thousands of them. It is astonishing where they all go, but that they do "go" is certain, and they are not likely to disappoint, for they are in every respect excellent, clean, sturdy, and mature. Not less satisfactory is the crop of Grapes on established Vines, all the leading varieties being well grown, the Vines planted in the ordinary soil of the nursery, trenched, and enriched with a heavy surface covering of manure. The value of trenching is firmly believed in at Sawbridgeworth, for the simple reason that without it so many and such good trees could not be produced on given plots of ground, nor such fine crops of Grapes in the houses. The weight of fruit is wonderful, and no rods are more heavily laden than those of the *Gros Maroc*, especially young rods; and it is pretty certain that a greater number of fine bunches of this beautiful Grape can be had by working the Vines on the long-rod than the short-spur system. No finer crops of any Grape could be desired than may be seen of *Gros Maroc*. The weight of fruit is far greater and the bunches finer on young canes than on old rods. It is the same with the *Duke of Buccleuch*, though only a few rods of it are grown, but that it can be grown at Sawbridgeworth is evident, for out of several thousands of canes one produced by the *Duke* surpasses them all, and it is doubtful if a finer has ever been seen of any variety of Grape.

IN THE GROUNDS.

We have been under glass so far, and might tarry longer, but must have a quick run through the grounds. In one quarter we see batches of fruit trees in pots, Pears bearing heavy crops and others in preparation for them. Peaches and Nectarines from which crops have been gathered and the wood now ripening, and smaller trees innumerable also ripening, and which will bear their first crop next year, with Apricots, Apples, Plums, Cherries, and Figs all grown in the same way, and all grown well.

In the open quarters the number of trees and varieties are bewildering. Old favourite Plums appear to be grown as extensively as ever, while the new ones, such as *The Czar* and *Grand Duke*, must be in great demand to necessitate such a bountiful supply, and it is confidently expected that the demand will go on increasing as the merits of the varieties become more widely known for supplying the markets with fruit at a time, early and late, when fine Plums are not commonly plentiful.

A plantation of what may be termed pyramid or vertical cordon Apple trees for bearing, with pyramid Gooseberries between the rows, is worthy of note. There are some 3000 trees in this plot, the Apples studded with spurs from the ground to the summit, and the Gooseberries laden with fruit. The Apple trees are not "summer pruned" to any material extent, Mr. Rivers having modified his views somewhat on that practice, which he is of opinion may be easily overdone or imperfectly conducted. If a branch threatens to go too far ahead of its fellows it is not cut back, but just the point is nipped off, and in that way the balance of the trees is maintained and their fruitfulness induced, while their vigour is not impaired. It is very apparent, however, that nothing approaching to overcrowding of the growths is permitted, but each shoot stands as it were alone, the leaves not being within touch of those on other shoots. That after all is the great secret of fruitfulness; and when summer pruning is so conducted as to result in a multiplicity of branches crushing against each other, it is an evil and not a benefit. Thousands of growths require to be thinned out of thousands of young trees in gardens of this country in order that those remaining may be rendered fertile.

Among Pears the seedling *Fertility* continues to merit its name, for the trees are crowded with fruit. This variety has been fruited for years, and never yet failed, therefore its raiser is justified in introducing it as a

market Pear of real usefulness, and not as a high-class imposing fruit for choice desserts.

Filberts and *Cob Nuts* are grown largely as standards, being inarched on stems 7 feet or so high, and in this way they form large, round, productive heads, with no troublesome suckers springing from the base, as fruiting examples in the pleasure grounds testify. In this form the trees are both ornamental and useful, as are a number of other trees of various kinds in this great establishment.—A VISITOR.

DRY WEATHER AND SHALLOW SOIL.

Not long ago when deep *versus* shallow working of the soil was being discussed in these pages we said nothing for or against either system, but had good reason to practise and advise deep digging. In cool damp weather shallow soils may give a fairly good return, but in excessively hot and dry times they are found wanting. Let those who only believe in surface scratching note the state of their crops at the present time. They are in a shrivelled and flavourless condition. The crops come in all at once, and are over quickly. The greatest help anyone can have in the kitchen garden in times of drought is a deep soil; while the most difficult matter to contend against is shallow-worked ground and surface-rooted plants. Now is the time to test the value of the systems.—A SCOTCH GARDENER.

THE SPOT ON PELARGONIUMS.

WHAT is the spot? Those who have really got the spot on a plant will be in no danger of not knowing what they have got. They who have never seen it, or are uncertain about it, may form a very good idea of the appearance it presents if they could conceive of a quantity of lead shot, from the size of pin-heads to that of small peas, heated as much as possible, and then retained in a scattered manner on the surface of the leaf, until the parts on which they rested were heated and scalded through. The petiole, or footstalk, of the leaf is frequently marked in a similar manner, and in very bad cases the young shoots are also similarly affected. It generally makes its appearance first on the oldest and most succulent leaves, and from small dots continues to spread until the leaves become unsightly, and in extreme cases fine flowers may be seen on plants pretty well as naked as a fowl would be that had lost most of its feathers.

Is the spot infectious? Some say, Yes; and would as soon allow one spotted plant to remain in their collection as a farmer would permit a diseased sheep to taint a flock. My own limited experience does not lead me to this conclusion. I think those plants will only be affected that have been individually submitted to the predisposing causes. True, it may often happen that after one plant becomes spotted, others in its vicinity will become spotted likewise; but that is no proof of infection, though it may be a reminder that all these have been subjected to unfavourable influences. That amid such spotted plants there should be some vigorous and healthy would not be conclusive evidence either way, as the natural constitution of the plant might be stronger to resist the taint; or, as we believe, that strength of constitution might be able to resist the deleterious influences that injured others; or, what is as likely, these influences were not brought to bear upon them in a similar manner, as a very little difference in the treatment, even as respects dryness and moisture, would make a great difference in the result. To make sure, however, and to act on the safe side, if the plant that gave the first signs of the spot was of no value I would counsel getting rid of it; if valuable and desirable, I would not do so, but keep it a little by itself.

Does the disease become inherent and constitutional in the plant? Here, again, many say, Yes! and if so, the keeping of such plants, or propagating young plants from them, would merely be doing all we can to propagate a disease. Unless the plants are much injured indeed, so as to affect the stems as well as the leaves, I should be under no alarm of the disease spreading; in other words, I do not consider the disease inherent and constitutional, because I have found that plants that were spotted one year were free from spot on the following year, and that the cuttings taken from them were also clean, green, and healthy. This result must be attributed to the disease existing chiefly in the foliage, and when that is wholly removed and the plants cut down the new leaves and shoots that are formed will give new and healthy vigour to the plants. Here, however, as in the last case, merely as a security, if I had healthy plants of the same kinds as these diseased, I would throw the latter away and grow from the former. But unless the shoots were injured very much I should be loath to throw away a good and scarce variety. In general cases I believe that the spot in the plants of this year need not be seen on the same plants next year.

What is the cause of the spot? Here the theories are endless; every grower, as he has a perfect right to do, assigning what, no doubt, appears to himself a satisfactory reason. I wish

I could here do the same. The following is what experience and observation have led me to consider as the causes, but I by no means consider them fully satisfactory. The main cause I attribute to a close, cold, stagnant, moist atmosphere, especially in winter. The injurious influence is farther increased when in these circumstances the soil about the roots is wet rather than dry; and again, these influences are farther increased when the

thing is attempted beyond keeping them, and the failures that then must be calculated on at times. Anything like growing in the first months of winter, by keeping them warm and closish, will receive a sad change when they must be shut up to keep out the cold. In such cases much may be done by preventing growth when the weather is mild by abundance of air, and comparative dryness at the roots. But then these would be circumstances

Fig. 20.—RIVERS' EARLY PROLIFIC CHERRY, from a tree in a pot.

plants had been previously growing in a highish average temperature, with only a small amount of sunshine; while after this cooling and damping process the sun shines rather bright for a few days, and we hastily think that the plants will be so fond of it after their cooling, that we never dream of giving them the slightest shade. Hence the difficulty of keeping the more tender of the Pelargonium section, fancy or florist, in cold pits, if any-

different from what we have supposed to be predisposing causes.

Let us glance at an imaginary case, the parallels for which may not unfrequently be found. These Pelargoniums after standing, as was quite right, in the sun until the wood has hardened, giving them but little water in the meantime, were cut down at the end of July, were placed in a shady place, and a

spare sash thrown over them until the spurs and horns left pushed out young shoots for their buds. Then they were taken to the potting shed, the old earth shaken from the roots, these roots pruned in a little if they wanted it, and then potted in fresh soil, and very likely in pots a size smaller than they stood in before. The owner wishes to get them forward, and keeps the plants rather close and moist in the warm months of autumn. They are transferred in good time to the greenhouse, and the same means of getting them to grow are persevered with. The grower has been told that 45° is the lowest the plants should see at night, and November being warm, the natural and artificial climate combined is generally nearer 50° to 55° at night, while the days, though warm, are but sparingly brightened by sunshine. The plants are rather extra watered as a matter of course, and leaves get large and fine, and as the old saying has it, "as green as Leeks." In December and January a sudden change comes, the weather becomes misty and cold, the plants are saturated with moisture, all the lights are kept shut, and as visions of economy in fuel, combined with inattention, obtrude upon the scene, the plants are considered perfectly safe if the thermometer is only a little above freezing point—nothing is thought of the danger of extremes. No account is taken of the amount of watery fluid stuffed into the plant in warmer dull weather, and which now can neither undergo elaboration, nor yet be got rid of by perspiration; and when, after a week, or a month, or a number of days of such treatment in such circumstances, the mist having disappeared, the cold black frosts having said for a time good-bye, and the sun having once more appeared strong and bright in the heavens, not a doubt is entertained but these squashy leaves would rejoice in his light, and hold up their fronts as boldly as if they had never luxuriated save in his presence, and had not been starved and swilled by turns in his absence; and great is the outcry when the rays penetrate and scald all the softest watery places.

The presence of the sun in such circumstances, though it accelerates, is not indispensably necessary to such an issue. Continued moisture at the roots, with a stagnant, moist, cold atmosphere around them, will, from the debility thus occasioned, alone predispose this disease in the leaves, and that will be only accelerated in its manifestation when from such coldness and moisture the plants are hastily transferred, or allowed to remain in an atmosphere as kiln-dried as it was at saturation point before. How often are glasses shut in a mild day in winter, when the exciting influence of a moist atmosphere should have been counteracted with a free current of air; while the same glasses are freely opened in a sunny frosty day, though the air is dry enough to crack and scorch the lips and cheeks of the hardiest beauty. It never strikes many of us that there could be any analogy in such circumstances between our own skin and the leaves of tender plants.

What are the palliatives for, and the preventions necessary against the disease? First, as respects palliatives, there can be little done with large plants that are blooming early. Nothing remains but to remove the worst leaves after they get very unsightly; and as soon as the flowers begin to fade set the plants to dry in the sun, and prune back earlier than usual, thus getting rid at once of all the spotted foliage. This, of course, will be followed only by those who do not consider the disease to be constitutional to the plant. No means that I have heard of will ever make a spotted-leaf green again. Young plants that are not expected to bloom for a month or two may be grown out of the spot. Almost every affected leaf should be removed at once. If the plants are kept rather close during the day, and with air at night, shaded or syringed during sunshine to prevent a too rapid perspiration, young foliage will soon be formed, and unless the smaller leaves left had previously been affected, there will be little manifestation of it on these young plants. A check to healthy growth was the predisposing cause, and an encouragement to free and active growth must now be resorted to, to get rid of its appearance. A highish temperature during the day, a cooler and airier atmosphere at night, will best promote this object. It would be of little use resorting to such a palliative until gentle April had come.

Secondly, preventing the manifestation of the disease may be gathered from what has already been said. In one word, it must be accomplished by attending to all the points of good culture, and especially guarding against sudden extremes of heat and cold, moisture and dryness, and more particularly guarding against a great degree of cold visiting the plants while the roots are soaked with water and the atmosphere not far from the dew point. A number of our friends contrive to grow these plants by keeping them for the most of the winter in cold pits and frames, where they can apply no artificial dry heat, and where they succeed well, as they often do, so much greater is the

honour. From such we have numberless inquiries as respects this very subject, and the advice we would give is simply this: Get your plants potted as early as you can, and use pots small rather than otherwise, and soil light rather than rich, and grow the plants pretty freely until the end of October, when the pots will be pretty well filled with roots. From that time until the end of February be more anxious to keep your plants than to grow them. Give them as much air as possible in mild weather, and as little water at the roots as will just keep the leaves from flagging. If a bright sun should come with mild weather expose your plants as much as possible, but even then be careful of watering overmuch. If the foliage seems distressed, and on examining the soil you find there is still moisture about it, just lessen evaporation from the foliage by dewing the leaves with the syringe, taking care to do it as gently as not to damp the place. If sunny days come attended with a keen, dry, frosty air, give but little air, repeat the dewing process; the leaves will not be weakened in such circumstances by a little heat—sun heat, for short intervals, will not draw the plants, and then, with a little air behind, the beams of the sun will dry and make all comfortable inside. If the plants show extra signs of suffering, prefer a little shade to opening the lights in such circumstances. By following this plan the plants will be stiff and hardy, scarcely larger on the first day of March than they were on the first day of November; but the leaves, though small, will be firm and tough, instead of soft and squashy. By the end of February advantage may be taken of fine days to give the plant an impetus to grow, as long dull weather after March sets in does not often dangerously trouble us. By April the plants may be shifted if desirable, if not, manure water should be given; and shifted or not shifted, that manure water communicated after the flower buds are peeping will give you fine trusses of bloom, accompanied with small healthy foliage, instead of large leaves and small trusses.

I need not mention that similar treatment will be requisite in greenhouses or Pelargonium houses, but the difficulty will be greatly lessened, as the artificial heat enables us to avoid all extremes of temperature and of moisture and dryness in the atmosphere. For instance, in continued muggy weather we have no resource in a cold pit, but a small fire would at once dissipate the mist and promote circulation in the greenhouse. The more care that is taken of the watering pot, however, during winter, the less the likelihood of spot appearing, even though the average temperature should be rather low at times. Keeping Pelargonium plants, those not actually blooming I mean, rather dry in winter and spring is the great main secret of successful culture. The next is giving them all the air possible consistent with an atmosphere not too cold nor too moist. From 43° to 48° may be considered a fair average temperature for such plants at night. The Fancies should not remain long below 45° , though a night or two at a time a little lower will do them no harm. If from some of the most successful exhibitors of these plants, whether Fancies or the old florist kinds, you could learn the real means how they obtained such masses of bloom with just enough of healthy foliage to act as a pleasant counterfoil, they would tell you that their plants got but little water until the flower buds appeared.—F. J. R.

EARLY PEACHES.

THE climate in which Mr. Muir ripened Hale's Early Peach must be much more forcing than Hertfordshire, as the Hale's Early Peach is now (July 29th) ripening and ripe. In 1868 it ripened on the 20th July, but it has not to my knowledge ever ripened before this time. The Alexander would probably ripen about the 4th June in Mr. Muir's house. I should advise him to plant it on a large scale for profit.

Here the Alexander ripens in a cool house about the 1st to 4th July, and is followed by the Early Beatrice, generally from the 6th to the 10th, Early Louise on the 16th, Early Rivers 20th. This is immediately followed by the Hale's Early, nearly a month behind Mr. Muir. The climate of this district must therefore differ in a very pronounced degree, and it is not a little singular that such a variation exists. It is said to be keen and harsh to weak constitutions, possessing, however, a kindly ripening power, giving strength to good men and flavour to good fruits.—T. FRANCIS RIVERS, *Sawbridgeworth*.

HORTICULTURAL SHOWS.

ROYAL SOUTHAMPTON HORTICULTURAL SOCIETY.

AUGUST 1ST AND 3RD.

THE Exhibition of plants, cut flowers, fruits, and vegetables, which was opened on Saturday and continued over Bank Holiday, must be described as one of the best as regards the number and quality of the exhibits and the attendance of visitors which this flourishing and eminently well-managed Society has held for many years. There is no confusion in the directing and staging of exhibits, but the work is conducted with smooth regularity.

The arrangement of the various specimen plants and groups was very effective.

PLANTS.—For the best twelve stove or greenhouse plants, six in bloom, six foliage, distinct, the veteran grower Mr. J. Cypher of Cheltenham was easily first out of three lots staged with grand, even, fresh plants, including well-coloured Crotons Sunset (6 feet through) and Queen Victoria (about the same size), *Phenocoma prolifera* Barnesii (5 feet through and grandly flowered), *Allamanda Hendersoni*, *Dipladenia Brearleyana*, *Dasy-lirion acrotrichum*, *Erica Thompsoni*, *Encephalartos villosus* (having fronds 10 feet long), and *Stephanotis floribunda*. Mr. Rann, Handcross Park, Crawley, was second, his best plants being a superbly flowered *Statice profusa* and a highly coloured *Croton interruptus* (9 feet over), with C. Warreni nearly as large. Mr. Tudgey of Waltham Cross followed, his best plants being *Ixora Williamsi* and *Ericas tricolor superba* and *Wilsoni*. For a like number of plants not open to exhibitors in the preceding class Mr. J. Mould, Pewsey, had the best collection, staging among others good plants of *Allamanda Hendersoni*, *Dipladenia Brearleyana*, *Erica insignis*, *Allamanda nobilis*, *Statice profusa*, *Dracena Goldiana* (good), and *Croton Queen Victoria*. Messrs. Ransom, nurserymen, Hill Lane, Southampton, were a good second, showing good plants of *Statice profusa* and *Ixora Williamsi*; third, Messrs. Oakley and Watling, nurserymen, St. Mary's Road, Southampton. In a class for a like number of plants for gardeners only, Mr. Wills, gardener to Mrs. Pearce, The Firs, Bassett, was a good first, showing among others good plants of *Phenocoma prolifera* Barnesii, *Clerodendron Balfourianum*, *Erica Parmentieriana rosea*, *Bougainvillea glabra*, and *Kalosanthes coccinea*. Mr. N. Blandford, gardener to Mrs. Haselfoot, Moor Hill, West End, Southampton, was a very good second, his best plants being *Clerodendron Balfourianum* and *Allamanda Hendersoni*. Third, Mr. Amys, gardener to the Hon. Mrs. York Elliot, Hamble Cliff, Southampton. The class for nine miscellaneous plants, not less than three to be in flower, brought out some good examples. First, Mr. Molyneux, gardener to W. H. Myers, Esq., Swanmore Park, Bishops Waltham. Second, Mr. Budd, gardener to F. G. Dalgely, Esq., Lockerby Hall, Romsey. Third, Mr. Reynolds, gardener to Colonel the Hon. H. Crichton, Netley Castle, Southampton. Fourth, Mr. Peel, gardener to Miss Todd, Sidford Lodge, Shirley. Mr. Molyneux's collection included finely coloured Crotons variegatus and Queen Victoria, *Alocasia macrorrhiza variegata*, having large well-developed blotched leaves; *Chamaedorea glaucifolia*, a very graceful plant; *Begonia Emperor* having large fresh flowers, and *Trachelium cœruleum*, a hardy plant not subject to pot culture so much as it deserves to be.

Groups of miscellaneous plants arranged for effect are always strong features at the Southampton shows, and the present ones proved no less attractive or meritorious than those of previous years. First, Mr. Wills; second, Messrs. Ransom; third, Mr. Reynolds, the fourth going to Mr. N. Blandford. There were five groups arranged in the amateurs' section, which compared favourably with them. There was only one entry for a collection of Orchids—Mr. N. Blandford, who was awarded a second prize for a very neat fresh lot of little plants, including *Odontoglossum vexillarium*, *O. Roezlii*, and *Saccolabium Blumei*. Messrs. Oakley & Watling had the best miscellaneous collection of nursery stock, Mrs. Kingsbury the second best, Mr. G. Windebank third, Messrs. Ransom fourth, Mr. W. Rogers, Red Lodge Nursery, receiving an extra prize. Messrs. Elcombe & Son, Romsey, contributed a similar lot in an extra class, which was highly commended.

Mr. Wills was first in the class for six Begonias, distinct, in flower; Mr. Osborne, Wilton House, Southampton, second; Mr. Blandford, third; and Mr. Windebank, Bevis Mount Nursery, Southampton, fourth. There were two lots of four double Begonias staged by Messrs. Wills and Osborn, who obtained the prizes in that order. There were three lots of six stove or greenhouse Ferns staged by Messrs. Wills, Amys, and Peel, who secured the prizes in the order in which their names appear. Mr. Wills' plants of *Davallia divaricata*, *Dicksonia antarctica*, *Nephrolepis davallioides*, *Microlepia hispida*, and *Adiantum farleyense* were even, clear, fresh, and well grown. There was only one entry in the nurserymen's class for four stove or greenhouse Ferns, distinct, and the prize went to Mr. J. Mould for a rather weak lot; and in a similar class for gardeners there were three lots staged: First, Mr. N. Blandford with nicely trained plants of *Lygodium scandens*, *Adiantum cuneatum*, *A. concinnum*, and *Davallia Mooreana*. Second Mr. Budd, whose best plants were *Davallia bullata* and *Dicksonia antarctica*. Third Mr. Reynolds. Mr. Wills had the best six Fuchsias, and Mr. Joy the second best; and Mr. Betteridge had the four best in the corresponding class. For six Pelargoniums, Zonal or Nosegay, Mr. Windebank was first, Mr. Wills second, and Mr. Blandford third. In the corresponding class for six double or semi-double, Messrs. Ransom were first, closely followed by Messrs. Wills and Windebank. Out of two lots of four plants of the description given in the two preceding classes, Mr. Betteridge and Mr. R. West, Northlands, Salisbury, were first and second respectively. In the next class for two Golden Tricolor, two Bronze, one Silver Tricolor, and one Silver-edged Pelargonium, distinct, collections were staged by Messrs. Wills and R. West, who received the awards in that order. Four good lots of six plants of *Celosia pyramidalis* of an excellent strain were staged. Messrs. Amys, Osborne, and Wills secured the awards in that order, all showing well. Three very good pans of fresh well-flowered *Achimenes* in six distinct varieties were staged by Messrs. Osborne, Wills, and Amys, to whom the prizes were awarded. Mr. J. Allen, gardener to J. Baily, Esq., Elmfield, Southampton, was the only exhibitor of eight Gloxinias, and a first prize was deservedly awarded to him. Three lots in six varieties of *Coleus pyramidalis* trained were staged by Messrs. Wills, R. West, and Amys, who secured the prizes in that order; and for a like number of *Selaginellas*, distinct, there were two competitors. First Mr. G. Busby, gardener to F. Williams, Esq., Thornhill Park, Bittern, with good pans of denticulate, variegata, densa, Martensi, formosa, coesia, and robusta; Mr. Wills being a close second. In the class for six plants suitable for dinner-table decoration, distinct, the prizes went to Messrs. Wills, Budd, Reynolds, and F. Thomson in that order. Mr. Wills was first in the class for a specimen Orchid. There were five specimen foliage plants shown, Mr. Rann being first with a grandly coloured *Croton Youngii* 8 feet over; second Mrs. Kingsbury with *Latania borbonica*, third Mr. Wills with *Croton Queen Victoria*; and out of a like number of specimen flowering plants Mr. Blandford was a good first with *Allamanda Schottii*, second Mr. Osborne with *Anthrrium Andre-*

anum (a well-grown plant), third Mr. James Cypher with *Ixora floribunda* nana. Mr. Wills had the best specimen Fuchsia, showing a fine plant of elegans 9 feet high and well flowered; second Mr. Osborne; third Mr. W. Joy, Shirley. Mr. Wills was the only exhibitor of hardy Ferns, and he was awarded a first prize. There were three lots of six Petunias shown, all being neat well-grown plants. First Mr. Wills, second Mr. Amys, third Mr. Osborne. There were five exhibitors of six plants of Mignonette; first Mr. Amys, second Mr. Allen, third Mr. Reynolds, all showing dwarf well-flowered plants. There was only one lot of Cockscombs staged, for which Mr. Osborne obtained a second prize.

Table Decorations.—Four very effectively arranged tables were arranged in competition for the liberal prizes which the Society offered in this class, Grasses being judiciously used with flowers. Mr. J. Cypher was first, followed closely by Mr. J. R. Chard, Floral Depot, Clapham Common, and Miss Bessie Flight, Winchester. Mr. Cypher was also first for the best epergne decoration, in the base of which *Dipladenias*, *Eucharis*, *Lapagerias* alba and rosea were used with good effect. Second, Mr. J. F. Chamberlain. Third, Miss Flight. Fourth, Mr. Chard. In the class for a group of three stands or vases, arranged with foliage and flower, for table, Miss Flight and Miss Chamberlain were placed first and second in that order.

Cut Flowers.—For the most tastefully arranged basket of cut flowers (ladies' class), Miss Stratton, Northcroft, Portswood, was first. Second, Mrs. Thomson, Norman Court, Salisbury. Third, Miss Flight. For a basket of wild flowers and Grasses, first, Miss Stratton; second, Miss Flight; third, Miss Hobday, Shirley Road. Mr. Cypher had the most elegant ball bouquet, which, like the second best (Mr. Chard's), was composed of choice Orchids, Tuberoses, *Stephanotis*, *Pancratiums*, and buds of *Maréchal Niel* Rose, &c. Messrs. Keynes, Williams & Co., Salisbury, were a good third. Mr. Chard had the best bridal bouquet, which evinced an artistic arrangement of choice flowers, as also did the second, third, and fourth-prize ones, shown respectively by Mr. Cypher, Messrs. Keynes, Williams & Co., and Mr. Chas. Warden, gardener to Sir F. H. Bathurst, Bart., Clarendon Park, Salisbury. Mr. Chard was placed first for six buttonhole bouquets, Mr. E. Chamberlain second, and Miss Hobday third. For twelve bunches of cut flowers, distinct, Mr. Budd was put first, Mr. Thomson second, and Mr. Amys third. For twelve varieties of hardy herbaceous cut flowers Mr. Molyneux was a good first with an even fresh lot; Mr. Guillaume, Oriental Place, Southampton, second; and Mr. Pope, gardener to the Earl of Carnarvon, Highclere Castle, third. Mr. Molyneux was again first in the class for twelve trusses of Pelargoniums, distinct, second Mr. Warden, third Mr. Windebank; and in the corresponding class for a like number of trusses of double or semi-double, distinct, Mr. Molyneux took first honours, and Mr. Windebank second. Mr. Fiford secured first place for twelve Dahlias, distinct, second Mr. Windebank, third Mr. West. In the open class for Roses there were only two contestants—Messrs. Keynes, Williams & Co., and Messrs. Cross & Steir, Salisbury, who took the prizes in that order; and in the next class for twelve blooms Mr. Warden was easily first, showing fresh even blooms. Second, Mr. Flight, Twyford, Winchester. Third, Mr. West.

FRUIT.—Fruit, according to the opinion of the Judges—past and present members of the Fruit Committee of the Royal Horticultural Society of London—and the writer, was shown better as regards quantity and quality than at any previous exhibition of this Show or in London, during the present year. These remarks apply more directly to the collections and three and single-bunch classes of Grapes. There were three very good collections of eight kinds of fruit staged, the first (Mr. F. Thomson's) and second (Mr. H. W. Ward's, Longford Castle, Salisbury), being very close in point of merit. Mr. Budd was third. The first-prize lot consisted of good bunches of Muscat of Alexandria Grapes, but rather green, and Madresfield Court Grapes, Elruge Nectarine, Barrington Peach, Moor Park Apricot, White Marseilles Figs, Blenheim Orange Melon, and Smooth Cayenne Pine, all good. Mr. Ward's best dishes were his Black Hamburg, Lord Napier Nectarine, and a fruit of Captain Larks Melon, weighing 11½ lbs. Mr. Budd's strongest point was his Muscat of Alexandria Grapes, good, well-coloured bunches. In the class for six kinds (Pine excluded) there was only one entry—Mr. Molyneux, who was deservedly awarded first place for good Elruge Nectarines, Royal George Peach, Madresfield Court (good), and Muscat of Alexandria Grapes, Golden Perfection Melon, and Morello Cherries, a good even lot, which it would be hard to beat.

Grapes.—In the class for three bunches of black Grapes seven good lots were staged. First Mr. H. W. Ward with Madresfield Court, second Mr. Warden with good well-finished medium-sized bunches of Black Hamburg, Mr. Molyneux being a close third with the same variety, and Mr. Thomson a good fourth with fairly well finished Madresfield Court. In the corresponding class for three bunches of white Mr. Budd was first with Muscat of Alexandria, Mr. Molyneux being a good second, and Mr. Thompson third with rather green bunches; and Mr. Halls, East Cowes Castle, Isle of Wight, was fourth. There were only four competitors in this class, all showing Muscat of Alexandria. In the two-bunch classes (white and black) there were five entries in each. First Mr. Axford with Black Hamburg; second Mr. Allan; third Mr. Cox, Corhampton House Gardens, Bishops Waltham, with Madresfield Court; fourth Mr. Pope. White.—First Mr. Pope with good even bunches of Muscat of Alexandria, second Mr. Osborne with the same variety, third Mr. Axford, fourth Mr. Amys with Foster's Seedling. There were seven single bunches of black Grapes shown and six lots of white. In the former class Mr. Ward was first with Madresfield Court, Mr. Molyneux second with same variety, Mr. Allen third, and Mr. Saunders fourth. In the white class Mr. Budd was first with a neat well coloured bunch of Mrs. Pearson, second Mr. Thomson with Muscat of Alexandria, wanting in colour; third Mr. Saunders; fourth Mr. Ward with the same varieties, also deficient in colour. There were only two Pine Apples shown, and for which the exhibitors, Messrs. Ward and Thomson, were awarded second and third prizes in that order.

Mr. Saunders and Mr. Ward were first and second respectively with Blenheim Orange Melon, the third going to Mr. J. Axford, gardener to C. M. Shipley, Esq., Twyford Moors, Winchester. In the corresponding class for a green-fleshed variety Mr. Thomson was first with Victory of Bath; Mr. Saunders second with Eastnor Castle; Mr. W. Cotton, Hamilton Nursery, third with Green Hall Gems; and Mr. Ward fourth with Cox's Golden Gem. Peaches.—First Mr. Windebank with even highly coloured

fruits of Chancellor, second Mr. Thomson with Grosse Mignonne, third Mr. Cotton. Five dishes of good Nectarines were staged. First Mr. W. Cotton with Lord Napier, second Mr. Budd with Violette Hâtive, and third Mr. Ward. The classes for Apples and other hardy fruits were fairly well contested.

VEGETABLES.—Mr. Richards, gardener to the Earl of Normanton, Somerley House, Ringwood, was a good first out of three collections of vegetables, twelve distinct kinds, staged in admirable condition and with good taste; second Mr. Saunders, third Mr. Pope. Mr. Richards' collection included grand samples of White Elephant Onion, Canadian Wonder Bean, Reading Russet, International Kidney Potatoes, &c. Mr. Saunders' best dishes were his Cream Marrow, International Kidney Potatoes, and Tomatoes. There were ten collections of nine kinds staged, Mr. Molyneux being easily first with a fine clean even lot; Mr. Allen second, Mr. Axford third, and Mr. Busby fourth. In the class for eight varieties of Potatoes, four kidney and four round, Mr. R. West was first, Mr. Saunders second, Mr. E. Axford third, and Mr. Ward fourth. For twelve spring-sown Onions Mr. Allen was first, Mr. Ward second, Mr. Busby third, and Mr. Saunders fourth; and in the class for a like number of autumn-sown bulbs Mr. Richards was a good first with Giant Rocca, Mr. Reynolds second, and Mr. Allen third. Mr. Molyneux was first for a neat, fresh, even brace of Telegraph Cucumbers, second Mr. Richards with Purley Park, third Mr. Amys with Telegraph, fourth Mr. Ward with Purley Park. Cottagers' produce was admirably represented for the season.

LIVERPOOL.

AUGUST 1ST.

THE annual exhibitions of the Liverpool Horticultural Association rank amongst the best that are held in the kingdom, and the one now to be noticed was a credit to the Association and the exhibitors. Nothing approaching a full and detailed report can be given, all that is practicable being to describe the character of the Show and to particularise the leading exhibits. The schedule was divided into four sections—plants, cut flowers, vegetables, and fruit, and contained ninety-eight classes, nearly all of them open, the prizes being very good throughout, and the competition in many classes exceedingly keen.

PLANTS.—In the premier class (twelve stove and greenhouse plants, six foliage and six flowering,) two magnificent collections were staged, as may be imagined when the ubiquitous and formidable Mr. Cypher of Cheltenham was fairly defeated by Mr. W. Mease, gardener to C. W. Newmann, Esq., Wyncote, Allerton. This exhibitor, to whom it is impossible to accord too much praise, staged amongst others perhaps the finest Crotons that have been seen in this country—namely, Weismanni and Queen Victoria, quite 8 feet high and the same in diameter, Disraeli being nearly as large, and all in superb condition. His other foliage plants were a huge *Latania borbonica*, a remarkably fine *Pritchardia pacifica*, and a very good *Gleichenia Mendellii*. The flowering plants were less striking—in fact, some rather weak. They comprised *Ericas* *Ne Plus Ultra* and *amula* (4 feet in diameter and both good), a *Clerodendron*, 5 feet in diameter, with a *Stephanotis*, *Bougainvillea*, and *Allamanda*. Mr. Cypher was stronger in flowering plants, yet nevertheless was quite overweighed. He, however, turned the tables on his rival in the class for six plants in bloom with fresh and beautiful examples of *Erica* *ampullacea* *Barnesi*, *Ixora regina*, *Allamanda nobilis*, a *Dipladenia*, and *Phenocoma*. Mr. Mease's second-prize plants were larger, but some of them a week too young—the flowers not fully expanded. In the local class for ten plants the first prize was well won by Mr. R. A. Cox, gardener to H. Watts, Esq., Glen Hall, Wavertree, who is evidently a first-class cultivator. He staged in this class *Ixora Dixiana*, an oval of 5 feet high, with two hundred trusses of brilliant flowers; *I. coccinea superba* and *I. regina*, with very fine trusses; *Allamanda Hendersoni*, profusely flowered; and *Statice Butcheri*, his foliage plants being also very good. Mr. Jellico, gardener to F. G. Gossage, Esq., Woolton, was second with a very good collection. In the class for six plants in pots not exceeding 12 inches in diameter Mr. Cox was again in the foremost place with admirable examples of culture; also for four plants. Mr. Mease staged the best single specimen stove plant, a vigorously grown *Anthurium Andreanum*, followed by Messrs. Butler, Moreno House, Aigburth; and Cubbon, gardener to Mrs. Johnson, Woolton. The best greenhouse plant was staged by Mr. Gordon, gardener to James Cunningham, Esq., Linton Lodge, Aigburth—*Kalanthes coccinea*, a magnificent bouquet of flowers, 5 to 6 feet in diameter. Mr. Mease was the premier exhibitor in the class for four *Ericas* with good examples of *Parmentieriana rosea*, *amula*, *metulæflora*, and *profusa*.

Fine-foliage plants were wonderfully good. In the open class for eight plants Mr. Mease secured the first position, staging among others *Croton Countess*, somewhat resembling *Johannis*, and very beautiful; *C. Prince of Wales*, handsome; *C. Morti*, grand. Mr. Cubbon was an excellent second. In the local class for six plants Mr. Jellico was the leading exhibitor, his group containing a remarkably well-grown plant of *Maranta Veitchii*; Mr. Foster, gardener to J. Brancker, Esq., Wavertree, second with creditable plants. Mr. Cubbon was first with *Palms*. Ferns were extremely well exhibited. In the open class for eight plants Mr. G. Rhodes, gardener to Mr. Horsfall, Grassendale, secured the first prize, *Davallia bullata* being particularly good, Mr. Cox following closely with neat examples. Still finer were the specimens staged in the local class for six plants, in which Mr. Gowan was first with *Davallia Mooreana*, 8 feet in diameter; *Goniophlebium subauriculatum*, *Adiantum farleyense*, fresh and vigorous; *Gleichenia spelunca*, *Pteris scaberula*, excellent; and *Adiantum Veitchii*. Mr. Cubbon was a close second, his *Microlepia hirta cristata* being of great merit, and all the rest good. Mr. Barber, St. Michael's Hamlet, Aigburth, was the foremost exhibitor in the class for six hardy Ferns with *Athyrium Filix-foemina*, *A. F. Victoria*, *Lastrea Filix-mas cristata*, *Onoclea sensibilis*, *Polystichum angulare*, and *Scolopendrium cristatum*, the remaining prizes being adjudged to Messrs. Foster and Cubbon, both exhibiting well. Mr. Foster exhibited *Lycopods*.

Mr. Mease staged very fine Tuberous Begonias, being first in the class for these brilliant plants, also for *Caladiums*, Mr. Butler for *Fuchsias*, 7 to 8 feet high and well furnished; Mr. Gowan and Messrs. Fleming & Son, Maghull, *Zonal Pelargoniums*, and they had also a special prize for pyramid Ivy-leaved varieties 8 feet high. The best double *Petunias* were exhibited

by Mr. Rhodes, and singles by Mr. Hurst, Mr. Manley receiving the chief prize for *Liliums*.

Orchids were not numerous, but those staged were very good, and that successful exhibitor, Mr. W. Mease, was to the fore for four plants with *Tbunia Marshalliana*, *Cypripedium Lawrencianum*, *Saccolabium Blumei majus*, and *Cattleya Gaskelliana*, Mr. J. Cypher being a good second. For one plant Mr. R. Cubbon was first with *Cattleya Leopoldii* with one very fine spike, Mr. T. Foster second, and Mr. J. Edwards, gardener to Shadford Walker, Esq., Rodney Street.

Table plants were shown in the usual good style as generally seen at the exhibitions of this Society. For six plants Mr. T. Fleetwood, gardener to T. F. Harrison, Esq., Holmfield, Aigburth, was first with neat, clean, well-grown examples of *Cocos Weddelliana*, *Dracæna* *Mrs. Bause*, *D. gracilis*, *Pandanus Veitchii*, *Aralia Veitchii*, and *Croton aigburthensis*. Mr. J. Agnew, gardener to Mrs. Watts, Grassendale Park, Woolton, second; and Mr. Cubbon third. The prizewinners for one Palm were Messrs. J. Hurst, G. Butler, and R. Cubbon. For one Tree Fern Messrs. R. Cubbon, J. Lowndes, and G. Butler. *Achimenes* were moderately good, and the most successful competitors were Messrs. T. Gowan, W. Mease, and J. Hurst.

Groups arranged for effect were wonderfully effective and attracted considerable attention. In the open class Messrs. R. P. Ker & Sons were deservedly accorded the first position for a most tastefully arranged and imposing circular group covering a space of 250 square feet. Mr. Francis, Green Bank, Wavertree, was placed second, being the only other competitor. In the amateurs' class, circular group to cover a space of 150 square feet, Mr. W. Mease was well first with a light and very pretty arrangement, Mr. A. R. Cox being a good second, his arrangement being less light and rather too green. Mr. J. Jellico was awarded the remaining prize.

CUT FLOWERS.—The display of these were very large and the quality first-class, especially the *Roses*, which were not only numerous but really superb—decidedly better than has before been the case at this Society's exhibition. In the class for forty-eight distinct *Roses* no less than seven collections were staged, and the work of judging was very difficult, as may be gathered from the fact that none of the exhibits contained a faulty bloom. Messrs. Harkness & Sons, nurserymen, Bedale, secured the premier position by two points only; the blooms being slightly smaller in this than in the second collection staged by Messrs. J. Cocker & Sons, Sunny Park Nursery, Aberdeen, but were a trifle brighter. Mr. A. Crosbie, gardener to T. B. Hall, Esq., Larchwood, Rock Ferry, and Messrs. R. Mack & Sons, Catterick Bridge, Yorkshire, were placed equal third, both having staged remarkably fine collections. The first lot contained very good *Le Havre*, *Madame Hausman*, *Tea Madame Hippolyte Jamain*, *Prince Arthur*, *Reynolds Hole*, *Emile Hausburg*, *Beauty of Waltham*, *Alfred Colomb*, *Mons. E. Y. Teas*, *Sultan of Zanzibar*, *Louis Van Houtte*, *Comtesse de Serenye*, *John Bright*, *Marie Verdier*, *Duke of Teck*, *Dr. Andry*, and *Duke of Connaught*. All the dark blooms in this collection were the most prominent, while the second one contained a larger quantity of good light flowers. Four collections were staged in the class for twelve *Tea*, *Hybrid Tea*, or *Noisette Roses*. Mr. T. B. Hall took the lead with nice blooms of *Anna Ollivier*, *Lady Mary Fitzwilliam*, *Souvenir d'un Ami*, *Souvenir d'Elise*, *Souvenir de Madame Pernet*, *Etoile de Lyon*, and *Madame Lambert*. Messrs. Harkness & Sons and Perkins & Sons, Coventry, were second and third respectively. In the amateurs' class for twenty-four blooms Mr. T. B. Hall took the lead with some superb blooms, followed closely by Mr. R. G. Waterman, gardener to A. Tate, Esq., Roseleigh, Woolton. For twelve blooms the prizewinners were Messrs. T. M. Green, A. Eaton, and W. E. Hall. For twelve blooms, dark variety, no less than nine lots were staged, and every one worthy of an award. Messrs. R. Mack & Sons were, however, placed first with *Alfred Colomb*, remarkably good; second, Mr. May, Bedale, with the same variety, also very fine; and third Messrs. A. Dickson and Sons, Newtownards, Co. Down, also staging the same variety. For the same number of blooms for one light variety Messrs. J. Cocker & Sons were first with *Merveille de Lyon*, very good. Messrs. Mack & Sons followed with *Baroness Rothschild*; Messrs. A. Dickson & Sons the remaining prize with *La France*. Seven lots were staged in this class. For the most tastefully arranged box of *Roses* Mr. R. G. Waterman was placed first, being lighter and more effectively arranged than the second, staged by Mr. T. B. Hall, which contained the best blooms. Probably the brightest scarlet bloom, although small, in the Exhibition was *Eclair*, shown by Messrs. Perkins & Sons in their collection of forty-eight. Messrs. A. Dickson & Sons staged blooms of a seedling *Tea* variety named *Miss Ethel Brownlow*, evidently a seedling between *Madame Lambert* and *Catherine Mermet*, which the Judges considered worthy of being again seen with more particulars respecting its habit and vigour. For the best collection of stove and greenhouse cut flowers, eighteen varieties, Mr. W. Mease was well to the front with a superb collection, consisting of *Allamanda grandiflora*, *A. Hendersoni*, *Anthurium Schertzerianum*, *A. Ferrierense* (very large spathes), *Cypripedium Veitchii*, *Gloriosa superba*, *Oncidium Lanceanum*, *Kalosanthes coccinea*, *Ixora Dixiana*, *I. Williamsi*, *Disa grandiflora*, and bunches of *Dipladenia amabilis*, *Stephanotis*, *Begonia Chesterfield*, and *Ball of Fire*. Mr. W. Bustard was placed second. For twelve varieties the prizetakers were Mr. A. R. Cox and J. Vaughan, gardener to R. Callart, Esq. The collections of herbaceous cut flowers were also very fine, especially the first collections in the class for eighteen varieties staged by Mr. W. Mease, and contained the following:—*Gladiolus brechleyensis*, *Vicia sylvatica*, *Spiræa palmata*, *Agrostemma flos-Jovis*, *A. The Queen*, *Spiræa Ulmaria fl.-pl.*, *Phlox Mrs. Downie*, *P. Venus*, *Campanula Hendersoni*, *Delphinium mollissimum*, *Lilium testaceum*, *L. auratum*, *L. candidum*, *Helenium pumilum*, *Telekia speciosissima*, *Achillea multifolia*, *Geranium sylvaticum*, *Geum coccineum*, *Dianthus Napoleon III.*, *Pentstemon Sir William Forbes*, and *Lychnis vespertina plena*. Messrs. J. Dickson and Sons, Newton Nurseries, Chester, second; and Mr. W. Bustard third. For twelve varieties Messrs. G. Eaton, R. G. Waterman, and A. Crosbie were the prizetakers in the order named. Pansies, Carnations, Dahlias were very well staged, but space forbids the enumeration of the prizewinners in the classes devoted to these cut flowers. Bouquets were remarkably good. For two Mr. J. Cypher took the lead with a handsome pair, followed by Messrs. Perkins & Sons and G. Downes, Lodge Lane, Liverpool. For one Mr. A. Crosbie was placed first; Mr. T. Robinson, Mossley Hill, second; and

Mr. H. Mercer third. The exhibits in the class for one vase or epergne were not extra good, and need no special mention.

Miscellaneous exhibits were numerous. The Horticultural Company (John Cowan), Garston, contributed largely to the effective display of one tent by staging two large circular groups of Tea Roses in bloom in 5-inch pots, and a similar group of varieties of *Lilium lancifolium*, while two others were composed of a general assortment of foliage plants, such as Crotons and Ferns, with large *Dendrobium Dalhousiana* and *D. Parishii* profusely flowered, arranged in the centre. A collection of Petunias and pot Vines were also on view. Messrs. R. P. Ker & Sons staged an imposing assortment of flowering and foliage plants, which included many new and rare kinds. Messrs. F. and A. Dickson & Sons also contributed a similar collection of plants; Messrs. Perkins & Sons, Coventry, plants of *Pelargonium Volonté Nationale* alba; and Mr. J. R. Pearson, Chilwell, Nottingham, a collection of Zonal Pelargoniums. The Horticultural Company also staged *Lagerstremia indica* in small pots, well bloomed, with pretty neat small pink flowers. Messrs. R. P. Ker & Sons were awarded certificates of merit for *Davallia fœniculosa*, *Vriesia hieroglyphica*, *Adiantum Caledoniæ*, and *Plumaria odoratissima* (Frangipani), very rarely seen in flower, and produces a sweet white *Tabernamontana*-like flower.

FRUIT.

The display of fruit was remarkably good, especially the collections in the open classes and those devoted to Grapes, while there was a slight falling off in the number of Peaches and Nectarines. In the open class for eight dishes, distinct, Mr. J. Edwards, gardener to the Duke of St. Albans, Bestwood, Nottingham, took the lead with examples of Muscat of Alexandria and Black Hamburg Grapes, good in every respect except size of berry, being rather small; Bellegarde Peaches remarkably fine, Elruge Nectarine good, Brown Turkey Figs, Cherries, a good Queen Pine, and a scarlet Premier Melon. Mr. J. Ward, gardener to T. H. Oakes, Esq., Riddings House, Alfreton, was the only other competitor in this class, and was deservedly placed second, having good Black Hamburg Grapes, Cherries, Bellegarde Peaches, Transparent Gage Plums, and a good Melon, the same variety as in the previous collection. In the class for six dishes, Pine excluded, six collections were staged, Mr. T. Elsworthy, gardener to A. R. Gladstone, Esq., Conrt Hey, Liverpool, took the lead with good Black Hamburg and fair Muscat of Alexandria Grapes, Bellegarde Peaches good Pine Apple Nectarine, very fine; Negro Largo Figs, and a fair Melon. Mr. J. Edwards was a close second, having remarkably large fruits of Chancellor Peaches, Elruge Nectarines, and Best of All Melon; Mr. W. Mease being third with good Grapes, Muscats being scarcely ripe, large Brown Turkey Figs, and a very fine netted fruit of Hero of Lockinge Melon. Pines were not numerous, and the fruits staged were scarcely up to the average. The finest in the class for two were staged by Mr. J. Bennett, gardener to the Hon. C. H. Wynne, Rug Corwen, North Wales; Mr. M. Hartwell, gardener to Lord Newborough, being second. For one fruit the first-mentioned exhibitor was again first, and Mr. J. Edmonds second.

Grapes on the whole were wonderfully good, being large in the bunch, well coloured, and with berries of a remarkably large size. Six or seven collections were staged in the class for four bunches, two white and two black varieties. Mr. C. Young, gardener to J. Evans, Esq., Hurst House, Prescott, gained the premier award with large bunches of Muscat of Alexandria, Madresfield Court, Black Hamburg, and Foster's Seedling. Mr. G. Middleton, gardener to R. Pilkington, Esq., Rainford Hall, was placed second, and had good Black Hamburg, Madresfield Court, and Buckland Sweetwater. Mr. J. Edmonds was awarded the remaining prize, having good Trebbiano. For two bunches of Black Hamburgs thirteen lots were staged for competition and the successful exhibitor was Mr. J. Barker, gardener to Alderman Rayner, Rock Ferry, who staged faultless examples. Mr. R. Brownbill, gardener to J. Hargraves, Esq., Ravenswood, Rock Ferry, and Mr. J. Hurst, gardener to W. B. Bowering, Esq., Beechwood, Aigburth, were the remaining prizewinners, both staging very fine examples. For two bunches of Muscat of Alexandria Grapes Mr. G. Middleton took the lead, followed by Mr. T. Dilworth, gardener to G. Holland, Esq., Liscard, New Brighton, and Mr. T. Jones, gardener to W. C. Clarke, Esq., Orleans House, Sefton Park, the bunches in each case being good and throughout the various exhibits, but scarcely ripe. For two bunches of black Grapes (Black Hamburgs excluded) several collections were staged. Mr. J. Barker was well first with large finely finished examples of Madresfield Court; Mr. J. Ward second with the same variety, and Mr. C. Young third, also showing the same kind. For two bunches of whites (Muscats excluded) the Duke of Buccleuch was the variety that gained the first, second, and third positions, and was very good in each instance, the exhibitors being Messrs. J. Bennett; J. Lowndes, gardener to S. S. Parker, Esq., Sudley Road, Aigburth; and Mr. J. Wallis, gardener to Rev. Walter Sneyd, Keele Hall, Staffordshire.

Peaches and Nectarines were very good, the fruit being extra large in several instances, but was not exhibited in such large numbers as has been the case in previous exhibitions. For one dish of Peaches Mr. W. Hannagan, gardener to R. C. Naylor, Esq., Hooton Hall, was first with wonderfully fine fruits of Royal George; Mr. T. Elsworthy second with good Bellegarde; and Mr. Ward third with the same variety as the first-mentioned competitor. For one dish, from which competitors in the previous class were excluded, Mr. J. Edmonds was well first with Chancellor in good condition; Mr. J. Storey, gardener to Sir Thomas Earle, Allerton Towers, second with Grosse Mignonne, good; and Mr. Burgess, gardener to H. R. Marsden, Esq., Errington Lodge, Aigburth, third with Early Albert. For one dish of Nectarines Mr. J. Bennett was placed first with *Violette Hâtive*; Mr. T. Elsworthy second with Elruge, third Mr. J. Wallis. In the corresponding class for one dish, exhibitors in the previous one being excluded, Mr. J. Hurst was first with Pine Apple; Mr. J. Edmonds and Mr. C. Copple, gardener to T. S. Rogerson, Esq., second and third, the former staging Elruge.

For the six prizes offered for Melons the competition was very good, and fruits were staged better than any we have seen this year. For one green-fleshed variety Mr. G. Rhodes was first with The Queen; Mr. J. Stevenson, The Hazels, Prescott, second with Hero of Lockinge; and Mr. T. Elsworthy third with Dickson's Exquisite. For one scarlet-fleshed kind Mr. T. Ferguson, gardener to Mrs. Patterson, Rock Ferry, took the lead with Scarlet Perfection; Messrs. S. Lyon and M. Hartwell being second and third

respectively. For Strawberries Mr. T. Foster was the principal prizewinner with British Queen, while Mr. T. Elsworthy took the lead with Cherries. For six dishes of hardy fruit, which was very good, and the prizes offered were well contested, Mr. W. Hannagan was placed second, and Mr. J. Wallis third. The first-prize collection contained no prize card, but we heard it belonged to Mr. J. Lambert. Prizes were offered by Mr. John Webster, horticultural builder, Wavertree, for the best basket of miscellaneous fruit arranged for effect, Pines excluded. Only two exhibitors contested for the prizes offered, Mr. W. Mease being placed first with an effectively arranged basket, and Mr. T. Elsworthy second with better fruit but not so tastefully arranged.

VEGETABLES

Were staged in quantity, and on the whole were of first-class quality; very rarely, if ever, do we remember having seen them in better condition at this Society's Exhibition. For a collection of twelve distinct varieties four or five competitors staged for the prizes offered. Mr. J. Lambert, gardener to Col. Wingfield, Onslow Hall, Shrewsbury, was deservedly placed first with very fine examples of Ayton Castle Leeks, Culverwell's Green Marrow Peas, Early London Cauliflowers, Silver Ball Onions, Nutting's Beet, Snowball Turnips, James's Intermediate Carrots, Telegraph Cucumbers, Trophy Tomatoes (good), Major Clarke's Celery, and Sutton's Prizetaker Potatoes. Mr. G. Conder, gardener to W. Chambers, Esq., second; and Mr. J. Oldfield, gardener to R. M. Ruddulph, Esq., Chirk Castle, Ruabon, third. In the corresponding class for the same number of varieties, open only to exhibitors within ten miles of Liverpool, Mr. W. Mease was accorded the premier position with Turnip-rooted Beet, Jersey Lily Turnips, Carters' Solid Ivory Celery, King of the Cauliflowers, International Potatoes, Moore's Cream Marrow, Globe Artichokes, Perfection Tomatoes, New Crimmon Vesuvius Onion, Osborn's Forcing Beans, and Duke of Albany Peas. Mr. J. Rainford and Mr. J. Storey being placed second and third, six collections being staged. For a collection of six varieties, from which competitors in the two previous

Fig. 21.

classes were excluded, ten collections were staged, Mr. A. R. Cox was placed first, Mr. J. Burgess second, and Mr. J. Elsworthy third. For six dishes of Peas the prizewinners were Messrs. J. Stevenson and J. Edmonds. For three dishes Messrs. W. Hosker, R. Haynan, and J. Rainford. For two dishes Mr. J. Bounds was the principal prizewinner. Potatoes were very fine, clean, and of a fair size. For six dishes Mr. W. Mease was placed first with Ashleaf Fluke, Reading Russet, Lady Truscott, Cosmopolitan, International, and Vicar of Laleham; Mr. S. T. Turner, Woodslee, Bromborough, and Mr. J. Storey being second and third. For four dishes the successful competitors were Messrs. J. Rainford and W. Hosker. For two Mr. J. Lowndes took the lead. Tomatoes were wonderfully fine, large and shapely, and the competition good. In the class for three dishes Mr. G. Middleton was well ahead with grand examples of Dedham Favourite, Stamfordian, and Hathaway's Excelsior; Mr. T. Foster being a good second, and Mr. J. Lambert third. For one dish Mr. G. Middleton took the lead with Dedham Favourite, followed by the same exhibitors as in the previous class, and in the same order. Cucumbers were of fair quality, and the winners were Messrs. M. Hartwell, J. Lambert, and J. Davies, Bromborough Hall.

IMPLEMENTS of various kinds were largely displayed. Mr. J. Bramham, 104, Dale Street, Liverpool, exhibited his Allerton Priory boiler, a quantity of wirework, water-cans, &c., a certificate of merit being awarded for the former, and a similar award to Messrs. F. & J. Mee, Wood Street. Gold medal to Messrs. Foster & Pearson for a curvilinear-roofed conservatory with patent ventilating gear. A certificate of merit was awarded Mr. J. Webster, Wavertree, for houses and a span-roofed frame ventilated on an improved system. Certificates of merit were also awarded to F. T. Drummond, Bridge North, Salop, for his turf-cutting machine, and Mr. W. E. Bennett, Thurston, Leyland, Preston, for Rose ligatures and a pot-washing machine that should be in all gardens where pots in large quantities require washing (see fig. 21). Messrs. W. Lowe & Sons, Edinburgh, also exhibited span-roofed greenhouses; Messrs. W. Glassey & Co., Victoria Street, Liverpool, a large display of all kinds of garden seats and chairs; Mr. P. B. Harkin, Dutton Street, Bamboo canes, Orchid baskets, and large teak tubs of various sizes. The Horticultural Company also contributed greenhouses and boilers to the general display.

HAWKHURST.

THE fourteenth annual Exhibition of the Hawkhurst Horticultural Society was recently held in Fowler's Park, and was in every respect a

decided success. The district comprised is situated principally in the fertile Weald of Kent, and the Society is well supported by the gentry who dwell in this very beautiful neighbourhood. At the Hawkhurst shows fruits and vegetables are invariably shown in large quantities and fine quality, the cottagers' productions being surprisingly good. Plants in variety are also well represented, and many of them would find favour with the judges at still more pretentious shows. The best stove and greenhouse flowering plants were shown by Mr. C. Nicholls, gardener to J. C. Fisher, Esq., and this experienced grower was also first for *Ericas* and other plants. Mr. J. Gilmour, gardener to the Right Hon. J. G. Goschen, M.P., was remarkably successful in various classes, notably for fine-foliage plants, *Fuchsias*, *Caladiums*, *Lycopodiums*, *Balsams*, *Coleus*, group of plants, &c. Mr. J. Knapp, gardener to H. Maynard, Esq., took the lead with *Zonal Pelargoniums*, *Cockscombs*, *Gloxinias*, fine-foliage and flowering plants, &c.; and other prominent exhibitors of plants were Messrs. G. Rummery, gardener to Sir E. P. Hardings, Bart.; F. Hodgkin, gardener to A. Oakes, Esq.; and L. Barnes, gardener to Lieut.-Col. Herschel. The same exhibitors were also the principal prizetakers for cut flowers.

The best collection of fruit was staged by Mr. H. Curtis, gardener to the Hon. J. Gathorne Hardy, M.P.; Mr. L. Barnes being second, and Mr. G. Rummery third. The best collection of hardy fruit was exhibited by Mr. J. Iggulden, gardener to the Rev. Canon Jeffreys, who was also first in both classes for Melons, the remaining prizes going to Messrs. Gilmour, J. Austen (gardener to Dr. W. Hamer), F. Hodgkin, and J. Rummery. Black Grapes were well shown by Messrs. B. Reeks (gardener to Mrs. Robert Watson Smith), L. Barnes, and J. Knapp; and white Grapes by Messrs. G. Catt, gardener to G. French, Esq.; L. Barnes, and G. Rummery, the prizes in each instance going in the order the names are placed.

The most successful in the different classes for vegetables, including those in which the prizes were provided by Messrs. Sutton & Sons, James Carter & Co., and Daniels Bros. were Messrs. Gilmour (who had three firsts), G. Rummery, L. Barnes, H. Lambert (gardener to Captain Swiney), J. Iggulden, J. Knapp, and W. H. Oxford, gardener to Col. W. H. Money-penny, the exhibits being generally most praiseworthy.

Altogether the Society has every reason to feel proud of the marked success attending its efforts.

THE SPLITTING OF FRUIT.

WHEN I last wrote under this heading (page 62) I referred to a letter of Mr. Henderson (page 526 last vol.) that I considered eminently worthy of consideration, but for the reason stated I could not reply to at the time. Your correspondent has not waited for the completion of my letter, but has thrown a sort of red herring communication into the controversy, and has, in my opinion, weakened his position very considerably. Mr. Henderson can, I perceive, move with circumstances. When I adjoined immersed Fern fronds continuing fresh with their stalks in the air I was met by the rejoinder that this was because their juices could not escape by evaporation, as if moisture could not and did not pass through the leaves. When, in reply, I asked that withering Pansy flowers, also Rose leaves and buds, be immersed to test the matter, as I had tested it, I am met with the remark that he did not for a moment think that anything he had said could imply a denial of the action of endosmosis "through the leaves and petals of flowers and vegetables." Way, then, did he seek to attribute the freshness of the Ferns simply to an arrest of evaporation? But let that pass, I am quite content to see him advancing so far as to make the important admission just quoted. He now admits the action of endosmosis on everything but fruit.

I think I may fairly say that Mr. Henderson has invented a new philosophy—namely, of partiality in the applicability of a natural law, for the principle of osmosis is as much a natural law as is that of gravitation, and is that partial? I am convinced that the new doctrine is fallacious and the position of its author untenable.

Your correspondent also entertains peculiar views on vegetable physiology. He admits that "endosmosis acts direct through animal and vegetable membranes," but not through the skins of Grapes, because these vegetable membranes are not porous. Not porous! How, then, does moisture escape through them by evaporation until they become raisins? If Mr. Henderson has some sensitive scales, delicate weights, and partially shrivelled Grapes, and will immerse the fruit after weighing it carefully, in water for a few hours, then weigh it again, he will find it has distinctly gained weight and plumpness by the transmission of the fluid through the "vegetable membrane;" and further, he will find if the Grapes are ripe and thin-skinned, they will very quickly split, so will ripe delicate-skinned Gooseberries.

I am taken to task by saying that a high temperature is not requisite for setting up the action of endosmosis in fruit to the extent of causing it to split, or why did I experiment with Grapes in a close damp box in a warm house? That is almost like catching at a straw. If that was all the evidence I have I should certainly not have written a line on this subject; it was a mere trifling experiment, but just worth mentioning. I have seen a hundred times more Grapes split in a damp unheated vinery in October, the roots of the Vines inside, no water given to them for months, the laterals allowed to grow in their own way to "take the sap from the fruit." Yet the crop was ruined; but that was of no consequence, it was an experimental house, and nothing else, and the Grapes split by the transmission of moisture through the skin. Another experiment I am acquainted with on a still larger scale, and the Vines all grown in pots, the soil purposely kept dry so that the leaves flagged, but the air damp, and the splitting was complete, and shanking too, but the damp air alone did not cause the shanking. Delicate-skinned Grapes will crack, and no one can prevent it if they are surrounded with damp air at a critical time. So will some varieties of Melons whether on or off the plants. Why does

damp air cause, say, the Midresfield Court Grapes to crack, as it undoubtedly does, if the moisture does not pass through the skin?

I am asked how I have arrived at the conclusion that ten times more moisture was conveyed by the roots to the Grapes that were hanging on the Vines at Hutton Hall than passed from the atmosphere through the stems of the bunches in the Manchester tent.

I know Mr. McIndoe's Grapes very well, and am not ignorant of his method of culture, but have had no communication whatever with him on this subject. As knowing more than either myself or my critic on the point in question I am willing to submit to Mr. McIndoe's decision as to whether I over-stated the case or not. In the meantime I emphasise my assertion.

Lastly, it is suggested by Mr. Henderson that I am "under the impression that I am bringing to light a principle of whose existence gardeners had been quite unaware." If he will turn to page 371 of the last volume (May 7th), he may observe that I quoted the "principle" from a scientific work there named, and of which I gave the date (1827). When your correspondent quotes an authority fifty-eight years old, and I imply he is setting up a claim to which he is not entitled, it will be open to him to remind me of the misfortune of having a treacherous memory. I am not even the originator of the application of the "principle" to fruit, though I do not know that there is much on the subject in print previous to this discussion.—A THINKER.

REVIEWS OF BOOKS.

Wild Flowers worth Notice. By MRS. LANKESTER. London: W. H. Allen & Co., 13, Waterloo Place.

Books devoted to the flora of Great Britain, and treating the subject both scientifically and popularly, are very numerous; but additions are continually being made to their number, and one of the most recent is the subject of this notice. The authoress is well known for several other works of a similar character, particularly for her "Plain and Easy Account of British Ferns" and the popular and interesting description in Sowerby's "English Botany." The chief object of the treatise on wild flowers is to give a selection of the most attractive of British plants with a condensed account of their uses and history, with such brief description that with the aid of the coloured figures the plants can be recognised. The figures mentioned are from drawings by J. E. Sowerby, 108 being given, and though they are small the majority faithfully depict the plants they represent.

In the course of an interesting preface referring to the advantages derived from a knowledge of wild plants rendering country walks more agreeable, the following passage concerning an amateur botanist in the Manchester district is worth perusal:—

"Let it not be supposed, however, that this search after wild flowers need be confined to such as have at their disposal all the appliances of science. The poorest inhabitant of a cottage has within her reach the same delight from this pursuit as the lady of the mansion, and we have many instances of the successful cultivation of botany by those who have to labour hard for their daily bread. Among the hills which surround the great manufacturing city of the north, Manchester, and even within the very atmosphere of its smoke, there exists at this day a club of working naturalists—chiefly botanists. All of them are artisans in some one of the great factories of the district. An account published by one of themselves of their weekly botanical excursions, their field-days, and the healthful and exhilarating effect on the minds and bodies of the members of this club, is most encouraging and delightful. The actual longevity of these humble naturalists is very remarkable. Old Crowther, one of the earliest workers in this direction, died at the age of 79; he was a simple-hearted man, willing to travel any distance and undergo any fatigue so that he secured his flower. As one of his old companions said, 'he was not *learned*, but he was very *loving*.' He never touched his wages for the purpose of botanical pleasure, but took home every penny, and trusted to fortunate accidents for the means of supplying his scientific wants. An account of the life and labours of another of this noble fraternity, the late Samuel Gibson, of Hebden Bridge, appeared in the *Manchester Guardian* of the 30th May, 1849. His herbarium of plants was sold after his death for the sum of £75, and many portions of his collection are now to be seen in the Peel Park Museum, Salford. In 1858 an annual meeting of these working-men naturalists took place near Manchester, at which there mustered not less than two hundred zealous and well-informed botanists, all, with the exception of four or five, of the artisan class. The one striking feature of this meeting seems to have been the hale and hearty appearance of the men already advanced in life; they were fine specimens of youth carried on into old age. There is evidently something in natural history wonderfully promotive of length of days. Men never step into the presence of Nature with affection and reverence, but they come back blessed and strengthened with a reward."

As an example of the style adopted in the body of the work we reproduce the following chapter on the White Water Lily (*Nymphaea alba*). After describing the flower the authoress proceeds:—

"The doctrine that all the parts of a plant are modifications of the leaves may be aptly illustrated by tracing the gradual changes which take place in the floral envelopes of this plant. Begin with the outermost whorl of sepals, and trace the leaf-like character gradually lessening until they become changed into perfect stamens, with petal-like anthers attached to them. The flower-stems are porous and succulent, but rapidly lose their moisture if removed from the water. The Water Lily may be transplanted from its native home by placing the thick stems in baskets of earth, and fastening stones to them so as to keep them well under water. These stems have a bitter, astringent taste, but are quite free from any of the poisonous acrid principle of the last family of plants we met with. They have been used in dyeing a dark brown colour. Goats and swine will eat them, and

they have been used medicinally. It is, however, as an object of beauty that the Water Lily claims our attention; and nothing can be more lovely than a calm lake on whose bosom may be seen floating numbers of these snowy nymphs. On Loch Lomond acres are covered with them; and in all the northern English lakes they are more or less abundant. Like the sacred Lotus of the Nile, the flowers rise and expand as the sun gains strength, and close again in the evening; sleeping as it were through the hours of darkness until called into life again by the warm rays of light.

"Moore poetically describes this natural process—

Those virgin Lilies all the night
Bathing their beauties in the lake,
That they may rise more fresh and bright
When their beloved sun's awake."

The stimulus of the sun's rays seems to have relation to the fertilisation of the plant. The pollen, if scattered beneath the water, would be washed away and decomposed, while on the expanded raised flower it is received without injury. This is truly the object for which—

The Water Lily to the light,
Her chalice rears of silver white."

And as it is with poets in sentiment, so it should be in our everyday life; each daily duty, if viewed aright, contains in it the elements of poetry, which might be made to surround the most prosaic acts of existence with beauty."

The nomenclature is generally accurate, but the adoption of capital initial letters for the specific names is a disfigurement, and the Cowslip is erroneously termed *Primula officinalis* instead of *P. veris*. A few literal errors occur, as in *Glanceum*, which should be *Glaucium*. It is a readable little book, and is most elegantly bound.

Where to Find Ferns. By FRANCIS GEORGE HEATH. London: Society for Promoting Christian Knowledge.

ONE very striking character of this little work is the large number of illustrations with which its pages are lightened, and as the majority of these are photographic reductions of the plates in the "Fern Portfolio" by the same author, and representing choice bits of scenery where Ferns abound, some idea can be formed of their character. For these alone the book is very cheap, and to many persons probably the matter will also be welcome. The author has endeavoured to avoid giving precise indication of the localities where the different species of Ferns are found, to prevent any of these being exterminated by enthusiastic collectors; but in this he appears to have defeated the object of the book as indicated in the title. For instance, we are told that *Allosorus crispus* is found in Chester, Cumberland, Derby, Devon, Durham, and other counties, and in most other cases no more precise indication is furnished. In a few, however, of the rarest, and those therefore most likely to be sought for, the exact positions are recorded. Mr. Heath thus states his object and the advantages of Fern-seeking in the explanatory chapter:—

"Fern-hunting to lovers of Ferns is one of the most delightful of pastimes. It gives zest to any country walk, because it adds the attraction of a hobby to the pleasure of being out of doors. Life in the present age is far too sedentary, and there exists too great a tendency to sit in rooms with closed doors and windows. Some people seem almost to dread air in motion, and they become, in time, so little used to it, that at length the body itself is brought into a morbid state, currents of air become 'draughts,' and cold and illness are the result. The air is the best friend we have, and in seeking outdoor pastimes in the country we obtain it in its best and purest form. The seeker after Ferns must ride his hobby into the wildest and most out-of-the-way districts, and into the most delicious nooks of greenery—must climb hills, wind through valleys, plunge into woods, follow the course of streams, search rocks, hedgebanks, and forest clumps, examine old walls and tree-forks, and look everywhere, in short, where green life has a chance of existence."

Chapters are devoted to the definition of terms, Fern habitats, the cultivation of Ferns, and the Ferns around London, and being neatly bound the book will undoubtedly find many purchasers.

FRUIT CROPS AND THE DROUGHT.

A RIDE through some parts of Wiltshire and the north-eastern borders of Somerset discloses the fact that Apples and Pears are by no means so plentiful as at one time it was thought they would be. Probably the crop was never more variable; some trees being overloaded, while others adjoining are nearly or quite bare. It would appear that those Apples which possess strong constitutions and those which did not perfect any fruit last season are the most fruitful this year, such sorts as Keswick and Gants Codlins, Lord Suffield, Hawthornden, Stirling Castle, Tower of Mankis, King of the Pippins, Warner's King, Damelow's Seedling, Cellini, and Cox's Orange Pippin being about the heaviest croppers. Large quantities are dropping off the trees, fortunately so in many cases; but whether this is the result of long-continued drought or not I cannot determine, though there is no doubt the drought will injuriously affect the size of the majority of those hanging.

Pears are also very abundant on some of the trees, but these do not seem disposed to drop; and unless freely thinned are certain to be small and poor in quality. All alike blossomed well, but the exposed trees have, as a rule, set the smallest crops. In many places the trees are almost smothered with honeydew, and the hot sun has burnt the foliage badly. Filberts, wherever slightly sheltered, appear to be bearing extraordinarily heavy crops, and Walnuts are fairly plentiful.

Morello Cherry trees appear to be fast dying back, and I do not remember having before seen so many strong trees losing so many branches. This strange disease, or whatever it is that is working the mischief, would appear to be also prevalent in other districts, and one

friend informs me that in a garden in Sussex the Morellos are dying back wholesale. Young and old trees appear to be similarly affected, and apparently there is no remedy for this most damaging disease.—W. I.

KITCHEN GARDEN.

Watering.—This has become very necessary with many crops. Peas coming into bloom or pod, as well as those which are later, must not be allowed to droop through dryness at the root or the crop will deteriorate. Water all of value thoroughly every three days or so, Celery will take copious supplies. Runner Beans will soon cease bearing if too dry; and where hands and means will allow general waterings should now be the chief part of the vegetable garden work. Weeds have stopped growing, small fruits are mostly gathered, and the grass in the pleasure grounds does not require much cutting now, so we have more time for watering, which we regard as profitable employment such times as these. There is no use in thinking whether watering can be best done in the morning or afternoon. We often go on all day, and on no account should it be neglected if a succession of good produce has to be kept up. Liquid manure is beneficial to all crops, but we do not pay so much attention to this in hot weather as getting the crops watered in any form. We dissolve a handful of guano in every four gallons of water, and give it after the plants have been first watered with clean water. We only give complete soakings, no surface waterings are tolerated.

Old Vegetables.—These are turning in fast. Peas and Broad Beans which were green and in full health a fortnight or so ago are now yellow and useless, and the sooner they are cleared off the better. Use the stakes which come from the Pea rows to hold up the later ones which now require support. Spinach and Lettuce are running fast to seed, and are cleared off to make room for rising crops. Lettuce stems are cut into lengths of from 1 inch to 2 inches, and preserved in syrup to be used by-and-by at dessert. They are very good; few could say they were eating wasted stems of Lettuce when partaking of this delicacy.

A Succession of Vegetables.—This tests the skill of a grower more than anything. We often see a remarkably good crop of one vegetable in at a particular time, and it is very satisfactory while it lasts; but when there is nothing more to follow, complaints from the kitchen and dining-room are certain. It is at midseason when we have experienced the greatest difficulty, and we now take the precaution to sow often of crops which are coming into use about that time. We can say nothing to remedy any mistake for this season, but we would urge cultivators, more especially young growers, to make a note of any deficiency and guard against it in time to come. No one has any cause to grumble about our supplies just now, but we have been making a note to sow our seeds deeper and further from the dry surface in time to come than we have hitherto done.

Spinach.—Just between the finishing of the summer Spinach and the coming-in of the winter crop, there is a danger of none being had, and where this really useful vegetable is valued, a gap in the supply will not do. A good and last sowing of the round-seeded variety should be made at once. Let the soil be rich, have the drills 15 inches apart, and sow thinly.

Turnips.—Those sown for autumn use have come up quick and well, and require thinning; this should not be delayed too long. Dwarf sturdy plants can only be secured by timely attention in this respect. Let them have plenty of room; it is the only way to secure fine bulbs in the short days. Seed of both early and late varieties may still be sown. The culture advised for the Spinach will suit them admirably.

Ripe Potatoes.—While the dry weather has been against many things of late it has certainly been in favour of early Potatoes, and our crops are excellent. The early and midseason ones are quite ripe, and will be lifted and stored forthwith. We have Brussels Sprouts, Savoys, and other winter vegetables growing between the Potatoes, and as it is difficult to get the tubers dug out clean when the leaves of the greens are meeting we are all the more anxious to take advantage of the present weather to put both the Potatoes and the greens straight.

French Beans.—Osborn's has been ready for some weeks in the open, and there are now plenty of tender pods of Canadian Wonder; and Laxton's Girtford Giant Runner gave us some good pods the last week in July. They are all very tender, and a nice change from the Peas. A late sowing of dwarfs may still be made in warm localities, but they must be put along the bottom of a south wall or in a position where they will be well sheltered in October, as this is the time they will be in bloom and fruit. When any kind of French Beans bears more pods than can be used they should be gathered before they become too old, as this causes the plants to cease producing young pods quicker than anything we know. We would rather gather the pods and throw them away than allow them to remain to spoil the successional fruiting of the rows.

FRUIT FORCING.

Figs.—*Early-forced Pot Trees.*—Figs that have been bearing in pots since the end of April will still be affording an abundance of fruit, with

a prospect of its continuance. It will not be advisable to continue syringing; indeed, it cannot be practised over the fruit when it is ripening without considerable risk of damaging it, causing it to crack, and impairing its flavour; but the air should be kept reasonably moist by syringing available surfaces, at the same time ventilating judiciously; also moderate the supply of tepid liquid to the roots. All the side shoots should now be closely stopped, so as to admit of a free circulation of air, and next year's fruiting wood must be thoroughly ripened before the trees go to rest. Under ordinary circumstances the trees should be in a fit condition for the removal of the roof lights early in September.

Succession Houses.—Trees from which a second crop is to be gathered will require fire heat, with a little air at night to prevent the atmosphere becoming stagnant, regulating the supply of moisture by the weather, the density of the foliage, and the situation of the house. In low situations and on cold heavy soils it is advisable to train in wood thinly, and to use water sparingly in dull periods, making up for quantity by improving the quality of the stimulating matter supplied to the roots, which ought to be entirely inside. In elevated sites, where there is the advantage of light and a dry atmosphere, water may be more freely used, but in the most favoured situations the heat and moisture must be so regulated by circumstances so as to secure the main point in successful Fig culture—viz., firm, short-jointed, and thoroughly ripened wood.

STRAWBERRIES IN POTS.—The runners that were layered in small pots some time ago and duly attended to with water will be well rooted, and, being detached and stood on the north side of a wall for a few days, should be potted into the fruiting pots without much further delay. A selection should be made of the plants, placing the stronger into 6-inch, whilst those that are less vigorous may have 5-inch pots. The compost most suitable is good turfy loam, with a fifth of well-decayed manure added, though we prefer to stack the manure with the loam from three to six months, and then chop down from one end, making moderately fine. Under ordinary circumstances it is in good potting condition, but if wet weather prevail it may be necessary to have it under cover for a few days, so as to part with any excess of moisture, as it is necessary the soil be in a condition to admit of being rammed firmly in the pots. To every barrowful of the loam we add a quart of soot, a similar quantity of Clay's or Beeson's manure, or about a quart of the mixture per bushel of loam, and incorporate thoroughly. The pots should be well drained, and the plants kept rather high in preference to low in the centre of the pots, sufficient space being allowed for watering. We prefer the space for a 6-inch pot to be about three-quarters of an inch, and to mulch the surface with some fresh horse droppings rubbed through the hands, which keeps the soil from leaving the sides of the pots, and encourages surface roots.

The plants after potting should be on a hard bottom, impervious to worms, and though they may be placed somewhat close in the first instance, they must be given space so as to allow for the full development of the foliage from all points. In addition to never being allowed to want for water at the roots, the plants may be sprinkled in the evening of hot days. It ought never to be lost sight of that the Strawberry delights in nothing so much as a cool moist condition at the roots, but it is equally necessary to bear in mind that if the plants are not to suffer by lack of water that a supply can be of no use when the soil is saturated, and ought not to be given until it becomes necessary.

Another important matter is to keep the foliage free from weeds, and never allow a runner to show without pinching it off. Another matter too often considered unimportant is to keep the plants to single crowns, which is particularly valuable in the case of plants for early work, as it hastens their development as compared with those that are permitted to form as many crowns as they will. Some kinds are not much given to form a number of crowns, amongst which may be instanced *La Grosse Sucrée*, *Pauline*, *Sir Harry*, *President*, *Dr. Hogg*, and *Cockscomb*, but even those form finer centre crowns when the sides ones are rubbed off directly they form. On the other hand, *Vicomtesse Hericart de Thury*, *Keen's Seedling*, *Mr. Radclyffe*, and *Sir Charles Napier* are liable to send up clusters of crowns, and it follows that when only one is taken the flower spikes are less numerous but very much stronger, and the flowers are consequently finer—the foundation of large fruits, which set well, swell off well, and finish handsomely. There may not be much difference between a plant carrying a dozen or more fruits in the weight collectively, but there is a great difference when we get the same weight in four to six fruits on another plant, not only in appearance but in quality, for a forced Strawberry is nothing unless it be large, of even shape and good in colour—a glowing red. Six-inch pots are suitable for all-round work, but for late work and strong growers they may have an inch larger size of pot. Besides keeping the plants free from aphides and red spider, a sharp look-out should be kept for caterpillars.

PLANT HOUSES.

Chrysanthemums.—Plants in from 3 to 6-inch pots are very useful for furnishing purposes during autumn and winter. To have these in really good condition strong cuttings from the tops of shoots that have been allowed to grow without stopping for some time should be selected and inserted at once. Good cuttings will be plentiful if previous directions have been carried out. The large-flowering kinds, such as *Elaine*, *James Salter*, *Peter the Great*, *Queen of England*, *Jardin des Plantes*, *Princess of Teck*, and others should be inserted singly in the smallest size pots, placing a little sand in the centre of the pot for the base of the cutting to rest upon. Pompon and small-flowering varieties should be inserted, a number together, in 5 or 6-inch pots. Some of these are remarkably fine in small pots if allowed to grow and branch into three shoots, carrying

one flower on the end of each. These plants will do this without stopping, for soon after they are rooted they will produce a crown bud and then branch into three shoots from below, the crown buds being removed.

Those inserted together in larger pots should be allowed to grow naturally without stopping or disbudding. The large-flowering kinds in small pots are allowed to carry only one bloom, and the crown bud produced is in most cases selected, except when it is necessary to make the early-flowering varieties a little later; such, for instance, as *James Salter*, *Elaine*, and *Early Red Dragon* have the crown buds removed, and one of the growths that starts from the base is allowed to grow and the flower is taken from the end of it, all other flower buds that surround it being removed. It is surprising how beautiful these miniature plants are, carrying one good bloom each, when elevated above other flowering plants, for they can be used where it is impossible to use plants in larger pots. The cuttings will root freely in a cold frame in any position where the sun cannot strike upon them. They should be well watered after insertion, and the frame kept close. Directly they are rooted they must be gradually hardened and stood outside with the rest of the stock, being careful that they are kept well watered at their roots.

Zonal Pelargoniums.—All plants intended for winter flowering must be outside in a sunny position to ripen and harden their wood, for this is the secret of their abundance of flowers through the whole of the winter. The only attention necessary while they are outside is pinching the shoots, removing flowers and dead leaves, besides supplying them liberally with water and weak stimulants when the pots are full of roots. A good batch of cuttings rooted now in 2 and 3-inch pots will be useful where quantities of plants are required in a small state for furnishing rooms. They should remain in the pots in which they are rooted, and are very handsome with one or two trusses on each for association with small Ferns, Mosses, Crotons, Roman Hyacinths, and other plants that may be employed. Free-flowering sorts only should be used, the semi-doubles lasting better for this purpose than the singles. Wonderful and *Madame Thibaut* are two of the most useful varieties. After the plants are rooted they may stand outside until the autumn. A good batch of both singles and doubles should now be rooted for early flowering in spring. As soon as these are rooted they must be pinched and placed into 4-inch pots, in which they will be wintered close to the glass. These if well looked after will be hardy, sturdy specimens, ready for 6-inch pots at the turn of the year.

French and Fanny Pelargoniums.—The earliest cuttings will now be rooted, and should have their points taken out; as soon as they have broken again into growth they should be transferred into 4-inch pots and grown in a cold frame with abundance of air until autumn. Good loam, one-seventh of manure and sand, will suit these plants, and if pressed firmly into the pots will insure dwarf sturdy growth. The shoots should be pinched until the end of September, but not afterwards, if required to flower as early as possible. It is a good plan when housing them to place them in their flowering pots, if ready, as they then become established before the winter. Old plants from which these cuttings were taken should now be pruned close back and placed in a cold frame, where they can be kept well syringed and close until they break again into growth, when they may be turned out, the old balls reduced, and the plants repotted into smaller pots. After potting, the frame should be kept close for ten days or a fortnight, and the plants watered with great care. If possible, the soil should be kept moist by syringing until root-action has well commenced. All late batches as they cease flowering should be well ripened by placing them in a sunny position outside, keeping them on the dry side until the wood is hard and firm, when they may be pruned back and treated as advised above.

Lilium candidum.—This is, perhaps, the best of all Lilies for cultivation in pots, as it can be trained to develop its pearly white fragrant flowers at Christmas and in succession until they can be had outside during the month of July. Those anxious to grow this Lily in pots should purchase at once, for imported bulbs can always be had by the middle of July or a week later. We have had many of these bulbs, and have always found them start into growth freely and do well even the first season. The bulbs should be potted into 6 or 7-inch pots, according to their size, in a compost of loam, one-seventh of decayed manure, and a little sand. After potting they should be stood in a frame, and the pots covered with about 2 inches of fine coal ash, cocoa-nut fibre refuse, or similar material, and the frame shaded until they push their leaves through. Water will not then be needed until a good quantity of roots has been formed. Plenty of air should be given as soon as growth is visible, and when it is fairly developed the pots can be plunged outside until the approach of frost. They can be allowed to remain in a cold frame until the turn of the new year, when they may be started into growth in a vinery or Peach house just started.

If wanted in flower as early as possible give greenhouse treatment, and no lower temperature at night than 45°, and the flower spikes will soon commence to push; in fact, they will continue to grow slowly all the winter. After the new year they will come forward rapidly in an intermediate temperature, where a good circulation of air can be maintained. Plants treated as described will flower towards the end of March, and if kept indoors after blooming until the weather is sufficiently genial to turn them outside, they will flower again about Christmas. Soon after flowering new growth at the base will be visible, when the old stem may be removed, and the plants either potted without disturbing their roots, or top-dressed with rich material and fed afterwards with weak stimulants or two or three applications of artificial manure. By care and good attention after flowering, with rich top-dressings and repotting occasionally, this Lily may be kept in perfect health in pots for many years.

THE FLOWER GARDEN AND PLEASURE GROUND.

Budding Roses.—The month of August we consider quite early enough for hudding these, as we prefer that the buds should lie dormant till the following spring, when they make much stronger growth than they usually do when they have formed a shoot the same summer they are inserted. The common Briar or Dog Rose is still the stock most generally relied upon, and it is as well adapted for dwarfs as standards. During showery seasons the operation of budding is a simple one, the beginner oftentimes being as successful as an expert, but the case will be very different this summer, as buds will not "run" freely, neither will the Briar shoots "open" properly. In order to improve both the buds and the stocks, the plants from which the former are to be taken, as well as the stocks, should receive several soakings of water, hudding not being attempted till it is found that the sap is risen in each case. Unless this is done the success will be very doubtful. Those who are unable to get any good buds from their own stock of Roses can procure them at a cheap rate from various nurserymen. The shoots with the buds attached should be packed in moistened moss, and ought never to become dry from the time they are cut, or the buds will not separate from the wood. We like to insert the buds as close to the stems of the Briars as possible, and they then soon become very firmly attached to the stems. The buds should also be closely shaded till they are attached to the wood of the stock.

Layering Carnations and Picotees.—No time should be lost in completing this work, layering being the best way of procuring strong young plants for flowering next season. The soil around the old plants should be loosened, a good soaking of water be given, a few hours after which a liberal dressing of sandy or gritty soil should be stirred into the surface. Trim off the lower leaves of the shoots to be layered, next cut the stems half through with a sharp knife immediately under a joint, and after cutting upwards through the joint, peg them down firmly into the soil. Should the present hot weather continue it is advisable to lightly shade the beds or single plants with branches of trees, and occasional waterings through a fine-rose pot will also benefit them, the layered pieces not to be separated from the old plants till well rooted, when the choicest of them may be potted and wintered in frames, and the remainder planted out where they are to flower next season.

Spring-bedding Plants.—These are making very poor progress, and many that have been freely divided are in a poor plight. Wallflowers, Sweet Williams, and Stocks are, if not pricked out, spoiling. The driest of plots may, if watered freely overnight, be finely broken down the next morning, and if the seed beds are also well soaked with water the plants may be lifted readily. After they are firmly dibbled out they should be watered in, and then shaded with branches of evergreens or other trees. This with light waterings in the evening will keep them alive, and directly growing weather is experienced the plants will make rapid progress. Seedling plants of Campanulas of sorts must also be attended to, or they will not become strong enough to flower well next season. Many of them have been very beautiful this year, but the old plants, if preserved, rarely flower well the following season. Polyanthus, Primroses, Daisies, Arabises, Alyssums, and other somewhat similar bedding plants that have been divided and replanted will require to be watered occasionally, and if in a hot position should also be temporarily shaded. The middle of August is quite early enough for sowing the seeds of such spring flowering annuals as Alyssum maritimum, Collinsia grandiflora, Lasthenia californica, Limnanthes Douglasii, Saponaria calabrica, Virginian Stocks, and in warm localities a week later would do. Silene pendula and the white variety should be sown on an open border at once, as these do not grow so rapidly as the above-named sorts.

Violets.—The hot weather has greatly interfered with the growth of these, and unless red spider is checked and free growth encouraged the flowering crowns will be very weak. The surface of the beds should be stirred with a Dutch hoe, and a good watering given, this being supplemented with a mulching of short manure or leaf soil, and nightly sprinklings will further assist them.

Lawns.—But little mowing is now needed, and in all cases it is best to do this without the receiving box being attached to the machine. Newly laid turf will be cracking very badly, and should have, if possible, a thorough soaking with water, followed with a top-dressing of fine soil, much of which may be worked into the cracks. This will serve to keep the grass alive, and when rainy weather sets in the turf will soon present a much better appearance.

THE BEE-KEEPER.

A WORD IN SEASON.

HONEY is now abundant in every pasture field. The thousands of heads of delicate White Clover and the sweet-scented Lime betoken a glorious time for the bees; but, and no pleasure is without its alloy, unless bees are taken to the Heather—the thought is often in my mind that each day is surely bringing the season to an end, and that by the 1st August in all probability there will be but little work to engage the attention of the bees beyond preparing their hives for another winter's storms. I, too, begin to meditate over the most desirable way to proceed in order to obtain for another year stocks of superior

strength to take advantage of the earliest flow of honey in the spring of the year 1886.

Generally speaking, there is no department in apiculture so little attended to and so much overlooked as this, one of the most important factors conducing to future success, the setting aside of the most fitting and strongest both in honey and in numbers, of the stocks to stand the winter and form the apiary. There are many different modes of management in order to ensure strong stocks in early spring, but probably nine out of ten bee-keepers will find the best and most expeditious way to be one of the two here given. In early September, if the bees are in large hives, add to each at least 5 lbs. of bees, and leave honey sufficient to last until the end of April without extraneous help, say 30 lbs. If there is not this weight of honey in each stock, a syrup made of sugar and water in the proportion of 3 lbs. of sugar to 2 lbs. of water, will prove just as serviceable. Such stocks strengthened by so numerous an addition with stores in abundance need only to be kept free from damp, and the severest winter of our climate may be looked forward to without any misgiving, and without much attention beyond when snow is upon the ground, either shading the entrances or closing them altogether with a slide of perforated zinc. Can any plan be simpler than the one above described? There need be no trouble about the queens, for the rule of the survival of the fittest will leave, in nine cases out of ten, the stronger queen and the one possessing the greater vitality at the head of the stock.

This plan, however, is not the one I generally follow, for to me the more profitable mode of procedure seems to be this, the second system. Early in August, the earlier the better after the honey season is at an end, drive the bees out of all the hives and join two lots together, always uniting those contiguous to one another. Where this system is pursued two hives are always placed side by side at swarming time in order to facilitate union. In the course, then, of the next three weeks give each hive 60 lbs. of syrup made of sugar and water in the above proportions. What is the result? A margin of profit for the honey, after the expense of the sugar has been met, taken from the old hive, stocks filled with new sweet comb with plenteous stores and cells all ready in the spring for the great number of eggs then deposited, and a sufficiency of pollen to last until the new supply begins, and a considerable batch of young bees to live till early summer. The advantages of the system are, I maintain, that all the honey in the hives that have stood the summer is ready for sale; if foul brood cells existed they are destroyed; if pollen-bound the cells are useless, and therefore the new ones are an advantage, and if the wax moth has gained an entrance her larvae are prevented from mining the stock. What can be urged against the plan? Well, I only know one, and that is that Dzierzon says that stocks do not winter so well in new comb because the older is warmer and more comfortable. I am convinced that in England such stocks can be wintered without misgiving. Let each one try a single stock this year for himself, the result will be quite satisfactory.

I must conclude by asking those who do try this system to give it a fair trial, carrying out the instructions in full, letting each hive, if a large one, have at least 8 or 10 lbs. of bees, and taking three weeks to give them the requisite amount of syrup. If anyone then fails—but they won't.—FELIX.

EXTRACTING HONEY.

SINCE writing to you I have read your article on taking off supers, and I must say that I have succeeded admirably. I did not use the carbolised paper rightly until your last remarks appeared, therefore my "wail" has changed with my success. I removed five 2 lb. sections, and took off the frame of empty sections, and also removed two bars of honey from the body hive without getting a sting. I find, however, many young bees in an early stage in most of the other frames—bottom part of the frames—and I thought it was wise not to extract until the young bees were matured. I put back an extracted frame next day, and found the bees were making wax on a frame of foundation and storing honey. There are now in that hive, I think, nine frames of honey and young bees. Will it kill the young ones to extract the honey? How many bars (14½ inches long 9 inches deep) would you leave in for the winter? Or would you extract all and give syrup? I have just examined the supers on the hive I told you I had not taken any sections from, and find the bees very busy, and one or two sections are being filled very nicely. Intended taking away the frame of sections to-day and extract all the honey I could, but as the bees were so busy, and young ones still in the frames, I desisted, and have done nothing to hinder their onward progress. I fancy the bees are busy on the second crop of Clover in the fields close by.

Kindly inform me how many frames of honey to leave in the hive for winter, and any information you can give me respecting the final manipulation before winter will oblige. I cannot quite understand how the "outside case" is fastened to the hive which you so kindly described last

week. Many thanks for your advice in the past. I might say that I find your journal more helpful than any other. I wish you could add weekly hints.—BASIL.

[Bees will work out comb foundation quicker than repair broken extracted combs. Do not extract honey from combs containing brood; it injures the bees and spoils the honey. Supering is the proper course to obtain surplus honey of good quality. About five frames of honey now will be required to keep the bees at rest during winter and tide them over till spring, but be sure and give more frames than nine of that size by April. I prefer the bees to have honey of their own gathering, they breed better on it, although syrup keeps them healthy during winter. You might take part and feed up—the most commendable way. There are various ways of fastening outside cases. They should be fastened to the floor proper of the case; a little hoop turning down on a rod of iron passing from side to side of the floor does very well. I should be very glad to add weekly hints, but unfortunately these cannot always be acted up to unless we know the state of bees and what the weather is likely to be. In an early article I will give some notes from my own apiary, which may serve a good purpose if note is taken of them. Where old queens are still regnant they should be deposed and young ones take their place. One frame with bees adhering, and containing brood and queen cell, does perfectly well for a nucleus. In my own apiary I have a stock hive divided in this fashion, with a comb of foundation on each side, and each has a frame feeder, recently described, so that in a short time they will be nice stocks, and when they have their hives completely filled with frames of brood and honey from healthy ones in September, will stand untouched until I put on supers next June, if spared. Now is the time to have hives filled with comb for next season. Condemned bees can be made to serve this good purpose.—A LANARKSHIRE BEE-KEEPER.]

THE SEASON—NOTES ON BEES.

DURING the whole of this month (July) up to the 18th, the temperature has been comparatively low in the north, and accompanied with strong withering winds, the average night temperature being 40°, and the day 60°, giving a mean of 50°—too low for honey secretion or gathering. Vegetation has suffered from the drought up to St. Swithin's day, when rain came, and it has been showery since.

In consequence of the low temperature bees remain in the condition they were in at the end of June, heavy with nearly finished supers. A few days' fine weather would enable the bees to finish a yield above the average. The first three weeks of June is the best time here for the Clover, and if the temperature would rise and the weather become fine, owing to the lateness of the season a large harvest would result. Farther south the yield from the white Clover has been good. The Heather will be later this season, and unless the weather improves soon there is not likely to be a large harvest from it. Those intending taking their bees to it should, however, have strong stocks only, as very often there are only a few days favourable to honey-gathering, and only strong stocks will do any good.

There are two ways of strengthening stocks: one is by joining swarms, the other by removing from hives the honeycombs that are sealed, and substitute those containing brood from others if healthy. If the weather is cold feed a little to encourage the bees to breed and hatch out that are already in the hives. Strong hives that have young queens will require no such manipulation. All my own are of this nature, and will, according to precedent, if a favourable opportunity occurs, gather at least 10 lbs. daily. When the supers at present on them are removed I will make a slight examination of some of the frames, and if they are extra heavy in honey will remove some and fill up with brood from a hive or hives set apart for that purpose.

A contemporary advises the extracting of all honey before sending to the Heather. Worse advice could not be given. It is most important that the body of the hive be filled with both honey and brood, otherwise supers will be very rare. With an empty house below, the bees will not enter supers; so I always endeavour to have all my stocks in a state to enter supers at once, if not already in them before they are removed.

Straw hives can either be strengthened with driven bees or two-tiered. Stewerton hives are admirably adapted for such, as the sections containing the brood of one can take the place of those containing honey removed. By this means the stock is reduced to what we wish, while those kept are put by the manipulation into the highest state of perfection for collecting a large quantity of honey and filling supers, while those with extracted and empty combs below may not enter supers at all, and as the nights in August and September are likely to get colder attention should be given towards keeping the supers well wrapped up.

A sufficient number of queens should be raised now to take the place of aged and unsatisfactory ones in September. Hives having young prolific queens are those that are to be depended on next season. Queens, even if only one year old, and that have done service in a non-swarmed hive, are liable to be deposed in April, when a successor might not be fertilised; whereas they are the only ones that can be depended on in hives not intended for swarming, while they are in every respect the best for swarming ones. Where small, consequently unprofitable, hives are kept queens last longer, but it is desirable with bees as with everything else to make the most of them; we tax their laying powers the first season as much as possible. Then queens reared now are better able to keep the large-hive system going than one hatched in May, which has laid much through the summer. Not one of my hives intended as non-swarmers lived this year, while over the hedge my neighbour with two-year-old queens and hives a bird less in size than mine have swarmed. I have something to say on

varieties of bees and swarming vagaries, but will defer it until another time.—A LANARKSHIRE BEE-KEEPER.

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (T. C.).—Miss Hassard's book, to which you refer, is published by Macmillan & Co., but we do not know the price of it, nor of any other work to suit you better.

Cones on Araucarias (R. C. W.).—Many Araucarias have produced cones in this country, and seedlings have been raised, but not in any great number. If you refer to the number of this Journal dated August 21st, 1884, you will find male and female cones illustrated as grown at Dropmore.

Fungus on Mint (J. S., Prestwich).—We are not able to explain the cause of the presence of the fungus in the stem of the Mint, but have usually observed it on plants that have been long established in a bed and hence impoverished the soil. We should plant healthy rooted slips in spring in fresh soil some distance from the present infected bed. We regret the publication of this reply has been accidentally delayed.

Seedling Verbena (J. B. Gaskell).—The trusses you have sent are good, and the colour—crimson scarlet—rich and bright, and as you say the habit of the plant, both in pots and beds, is all that can be desired, you may regard the variety as a very good one, and worthy of a name. We do not know how far it differs from the Hampton Court Crimson, as this can only be determined by seeing growing plants; if you should visit London this autumn you might go down to Hampton Court, taking a handful of your seedling with you, and compare for yourself; or if you were to send flowers, with a letter, to Mr. Graham, he would no doubt tell you in what respect, if any, your seedling differs from his.

Coloured Water Lilies—Filmy Ferns (A. C.).—The Blue Water Lily will not stand out of doors during the winter; it may, however, be grown in a large pan in a comparatively cool house. The red ones—*N. alba rosea* and *N. odorata rubra*—both of which would answer your purpose, are perfectly hardy, and will flourish freely in any tank or pond where they get plenty of sun. They may both be had true from Messrs. Backhouse & Sons, York, or from Mr. T. S. Ware, Tottenham, from whom prices can be obtained. Effective Filmy Ferns are *Todea superba*, *T. hymenophylloides*, *Hymenophyllum pulcherrimum*, *H. trichodeum*, *H. tunbridgensis*, and *Trichomanes radicans* and varieties. We know of no work specially devoted to their cultivation.

Lilium candidum (H. M.).—The best time for dividing bulbs of this *Lilium* is as soon as the stems commence withering after flowering, not waiting till they have entirely died down. The bulbs then commence rooting at once, produce a good growth of foliage before winter, and the plants that are strong enough will flower next year. We shall divide a number next week. It will be necessary for us to receive a spray with foliage, as well as a flower of the yellow Composite, for determining its name, and it should be packed in damp moss to arrive fresh. The flower you have sent in a dry box is totally withered.

Cucumbers Failing (Medicus).—We have seen Cucumbers successfully grown without ventilation of the house, but have never advised amateurs to adopt this method except experimentally. If you can raise the night temperature of the house to 70° or even 75° we advise you to do so, ventilating at 80° and closing at 85° or 90°. If you cannot do this you had better apply water less liberally, as the plants do not appear to be able to deal with the moisture that is supplied by the roots in the process of elaboration. Are you sure there is no red spider or other insects on the leaves? If there is not, and an improvement does not follow an increase of temperature, we should then fear your plants are overtaken with a disease that is practically incurable.

Stephanotis floribunda (R. H.).—You may pot your plant at once, and then it will have ample time to become well established before winter. It would have been better if you had done so some months ago. Potting may excite the plant into growth, and if so you must use every endeavour to thoroughly ripen the wood before winter. If it does not ripen well prune the unripened wood well back in spring before you start the plant into growth again. Encourage the extension of the roots into the new soil by plunging the pot in slight bottom heat, while the top of the plant is kept in a little lower temperature to prevent it from making fresh growth. If you do this and you rest the plant well during the winter it will start away luxuriantly another season. This plant does well in a compost of equal parts of fibry loam and peat, to which you may add a sprinkling of bone dust, a little crushed charcoal, and a liberal dash of coarse sand. The only manual on Orchids that would be suitable for you is the "Orchid Grower's Manual" by Mr. B. S. Williams.

Late Entries at Exhibitions (J. F., Hants).—As we have never had a similar case to yours submitted to us we print your letter:—"At a recent show I exhibited a collection of plants for a cup. Through an oversight no entry was made; but the plants were accepted, exhibited, and won first prize, the card put up and then taken down, the Committee having decided that as no entry was made the prize should be withheld. I entered a protest, saying that the Committee had no right to withhold the cup after the Secretary had allowed the plants to be exhibited and judged, and that I would hold them responsible for the cup. Am I right or wrong?" We can only say in reply that we have never known an award repudiated after the acceptance of an exhibit to which a prize has been awarded and the prize card attached, on the grounds indicated. If the card were not removed before the admittance of the public we suspect the Committee would have some difficulty in maintaining their position in a court of law; but we do not advise you to take action in the matter without consulting a solicitor. If you forgot to enter the plants at the prescribed time the Secretary would have been justified in refusing them, and if he had done so you would, perhaps, have felt yourself harshly treated. Whatever fault may have been committed you have contributed thereto by your "oversight," and this would not be overlooked. If the inadvertence of the Secretary were discovered and the prize card removed before the Show was open to the public we suspect your case would be considerably weakened. It would be imprudent to press your claim without good legal advice.

Hardy Climbers (S. S.).—We advise you first to incorporate some soil of a lighter nature with that surrounding your house. Leaf mould and a good quantity of coarse sand would be very suitable in which to give the plants for covering the walls a good start. After planting, mulch them with leaf mould or decayed manure, which arrests evaporation and prevents the ground cracking. Any of the following would be suitable for you:—*Clematis montana*, *C. flammula*, *Solanum jasminoides*, with *Passiflora corallina* and *Berberidopsis corallina*, if the locality is good. Some of the Ayrshire Roses, such as Dundee Rambler and Madame d'Arbly, *Jasminum nudiflorum*, *Lonicera flexuosum*, *Ceanothus azureus*, *C. dentatus*; *Ampelopsis Veitchii* would also grow rapidly, the latter clinging as well as Ivy without any nailing, and in autumn is most beautiful with its crimson foliage. You will be able to grow *Maréchal Niel* Rose very well at the back of your greenhouse, but you must bear in mind that this variety is very liable to canker and go off after a few years. There are solitary examples of plants surviving and doing well for a great number of years, but the majority canker badly when about six or seven years of age. It nevertheless is well worth a trial, for growth is rapid, and the flowers produced from well ripened wood are numerous. Therefore, if the plant is only short-lived, they abundantly repay for any care and trouble that may be required. We advise you to plant this Rose on its roots if you can obtain good strong plants; if not, on the seedling Briar. If on the latter, when planting bury the union of the stock and Rose well beneath the soil, so that it may root from the union and in time become independent of the stock. You may grow successfully all ordinary kinds of greenhouse plants in your house with this Rose, for we know numbers of greenhouses in which this Rose is planted that are also furnished with a general collection of plants.

Vines Unhealthy (H. O.).—We have examined the leaves and roots carefully, and can find no evidence of the attacks of the phylloxera. The Vines appear to be in a very enfeebled state indeed, and you did not renew the border soon enough. We observe they improved the first year after being lifted, but are now as bad as ever again, yet they have "not been heavily cropped." We suspect they have, as what would be considered a very light crop for healthy Vines would be really a heavy one for Vines in such a weak state as yours evidently are, and they would have been better now if they had borne no Grapes at all the year after removal. You do not say whether the Vines have been in charge of the same individual since they were originally planted. They appear to be quite exhausted, and certainly the root-action is defective. As the soil was procured from the same place as before, we assume there is no corroding matter in it. Considering their weakness, you cropped them too heavily last year and previously, and started them too early this, drawing the sap from the stems before the roots were able to act freely and supply the nourishment that was required for continuing the growth. Remove the crop, which can be of no value, and encourage the Vines to make all the lateral growth possible, syringing them and maintaining a genial atmosphere. There can be no free root-extension without more and better growth to incite it. If, after all you can do, they refuse to grow, we should cut them down in early winter, and there is a possibility that they would break in the spring and produce fairly good canes next year. We doubt if there is any other way in which their lost vigour can be regained, and even this may fail. They have been badly managed for some time past, and the last and greatest mistake was in forcing them into growth too soon this spring, draining the rods of what little vitality there was in them while the already too feeble roots were in a torpid state.

Choice Carnations and Picotees (A. C.).—As you do not state how many varieties you require we cannot do better than name six in each section, arranged in the order of merit as determined in an election conducted by the leading florists. The new varieties are included up to last year. Some of the yellow Picotees are excellent, some of the best varieties being named in our report of the Carnation Society's Show last week:—**CARNATIONS.**—*Scarlet Bizarres.*—Admiral Curzon (Easom), Fred (Dodwell), George (Dodwell), Robert Lord (Dodwell), Edward Adams (Dodwell), Arthur Medhurst (Dodwell). *Crimson Bizarres.*—Master Fred (Hewitt), J. D. Hextall (Simonite), Harrison Weir (Dodwell), Thomas Moore (Dodwell), Eccentric Jack (Ely), John Simonite (Simonite). *Pink and Purple Bizarres.*—Sarah Payne (Ward), Falconbridge (May), Squire Llewelyn (Dodwell), James Taylor (Gibbons), William Skirving (Gorton), Unexpected (Turner). *Purple Flakes.*—James Douglas (Simonite), Dr. Foster (Foster), Squire Meynell (Brahbin), Mayor of Nottingham (Taylor), Juno (Baildon), Squire Whithorn (Dodwell). *Scarlet Flakes.*—Clipper (Fletcher), Sportsman (Hedderley), John Ball (Dodwell), Dan Godfrey (Holmes), Annihilator (Jackson), Thomas Tomes (Dodwell). *Rose Flakes.*—John Keet (White, head), Sybil (Holmes), James Merryweather (Wood), Mrs. Dodwell (Lord), Jessica (Turner), Rob Roy (Gorton). **PICOTEES.**—*Heavy Red.*—John Smith (Bower), J. B. Bryant (Ingram). *Brunette* (Kirtland), Master Norman

(Norman), Mrs. Dodwell (Turner), Dr. Epps (Smith). *Light Red.*—Thomas William (Flowdy), Violet Douglas (Simonite), Mrs. Bower (Bower), Elsie Grace (Dodwell), Mrs. Gorton (Simonite), Clara (Bower). *Heavy Purple.*—Zerlina (Lord), Mrs. A. Chancellor (Turner), Alliance (Fellows), Tinnio (Dodwell), Muriel (Hewitt), Mrs. Summers (Simonite). *Light Purple.*—Ann Lord (Lord), Clara Penson (Willmer), Her Majesty (Addis), Minnie (Lord), Mary (Simonite), Nymph (Lord). *Heavy Rose and Scarlet.*—Mrs. Payne (Fellows), Miss Horner (Lord), Fanny Helen (Niven), Edith Dombrain (Turner), Royal Visit (Ahercrombie), Mrs. Rudd (Rudd). *Light Rose or Scarlet.*—Mrs. Allcroft (Turner), Miss Wood (Wood), Nellie (Rudd), Miss Gorton (Dodwell), Bertha (Morris), Mrs. Nicholl (Simonite).

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should contain spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once. (*G. F. R.*)—As the flowers of *Ixoras* change with age we cannot with certainty name the truss you have sent, but it resembles *I. Williamsi*. (*W. H.*)—*Athyrium Filix-femina*, var. (*E. H.*)—1, *Agapanthus umbellatus*; 2, *Tradescantia discolor*; 3, *Nephrolepis cordifolia*; 4, *Dyckia rariflora*; 5, *Chamaerops humilis*; 6, *Pteris incisae*. (*Young Hand*).—1, *Campanula Raineri*; 2, *Spiraea callosa* var; 3, *Spiraea Nobleana*; 4, *Spiraea salicifolia*; 5, *Abies nobilis*; 6, *Phillyrea media*.

Preserving Bees—Supers (J. E.).—If bees are wanted they are worth preserving after the honey is taken, if not later than end of September. If they are not required they are worth preserving for strengthening other stocks. It is quite customary amongst bee-keepers to feed driven bees after they are brought from the Heather. The breadth of the top bars for stock hives should be 1½ inch, with a quarter-inch space, or 1½ inch from centre to centre. Supers have broader bars 2 inches from centre to centre, bars 1½ inch broad. As some prefer sections, but find them objectionable in some respects, we will publish particulars of a simple method of fixing sections in a common super which answers the purpose of both crate and rack.

COVENT GARDEN MARKET.—AUGUST 5TH.

THERE is no noteworthy alteration in the state of the market.

THE CLERGYMAN'S FARM.

(Continued from page 102.)

BARLEY, Beans, and Peas afford valuable additions to our mixed corn diet for all the animals of the farm, as well as being useful alone. Barley and Peas may be grown with success upon all soils that are not heavy and wet; but then it may be asked, Ought any farm land to be so much neglected as to be undrained and to lack mechanical division? Certainly it must be acknowledged that it ought not, but the fact remains that much of it is still to be found in an unsatisfactory condition. For the clergyman's farm we do not advise a heavy outlay at the outset, but rather an annual and gradual improvement; drainage, paring, burning, dressing with lime and ashes each being done in its proper season, how much each year being really a question of ways and

means. Undoubtedly if a farm could be taken in hand immediately after harvest, foul land pared, and burned if necessary, or ploughed, hoed, harrowed thoroughly, cleansed from noxious weeds, and all necessary drainage done, it would sooner be brought into a high state of cultivation; which in other words may be explained as efficient drainage, mechanical division, abundant fertility, and freedom from couch grass, thistles, docks, nettles, and other perennial weeds.

To realise fully what is the actual difference in results from good and bad culture we should look closely into the ripening crops of grain now to be found upon different farms, see the root crops, the green crops upon arable land; examine hayricks, drawing careful comparisons, and striving to see for ourselves the causes of failure and success. That the best soil for Barley is a tolerably light, rich, and well-pulverised one is undoubtedly true, and when we attempt its cultivation we should to render the soil as near to this condition as may be. An average crop of Barley is estimated at 48 bushels per acre, which at 55 lbs. per bushel amounts in the aggregate to 2640 lbs., and the straw and chaff have been estimated at 3300 lbs., or 1½ times heavier than the grain. Both as whole and ground corn Barley should be used much more extensively than it is generally, and it should be made to help us avoid the heavy outlay for Maize so common to many farms. The Chevalier Barley is generally considered the best because of its superiority for malting purposes, and about 3 bushels of seed is usually sown to the acre. Thin seeding is infinitely preferable to thick seeding, the straw then coming sturdy and so robust that there is little risk of the crop being beaten down by heavy rain, yet it is notorious that Barley generally is very much lodged this season. This will render much of the grain unfit for malting purposes, and more of it than usual will probably be used for cattle food.

For Beans preference is wisely given to deep rich soil, for it is an exhausting crop, and the land is highly manured for it. Winter Beans are generally considered preferable to spring Beans; but late spring frost is often fatal to the blossom of winter Beans, as was the case this year, many a field of Beans having suffered so much that the crop is worthless. To apply the teaching of this severe lesson to practice we must let the situation of each farm and its degree of exposure or otherwise guide us in our decision as to whether we shall sow winter or spring Beans, a moderate quantity only being grown in proportion to other crops. Bean meal mixed with the best linseed cake is used by many farmers for old sheep now being folded upon the second growth of Clover and mixed seeds, and it is found highly valuable in promoting a plump lusty condition and early ripening for market. It contains 25 per cent. of albuminoids and 44 per cent. of carbohydrates. Crushed Beans are also both nourishing and strengthening food for cattle and horses. Peas may be regarded as more generally useful, and more land is devoted to this crop. We like to have a stack of unthreshed Peas in cut for pigs during winter, both Peas and straw being nourishing food, and the meal may be mixed advantageously with other corn for all animals. This mixing of home-grown corn for home consumption is most desirable, not only from the real benefit derived from it by the animals, but also as a means of keeping down bills for oilcake and corn. Before all things let us strive to render the farm self-supporting, avoiding expenditure of capital altogether if we can after the farm is cropped and stocked, using only the profits arising from the money invested in the land.

How to crop and how to stock is daily becoming a more serious consideration; but the clergyman using his land for the production of farm produce chiefly for home consumption is not so much affected by it as a tenant farmer, yet when the surplus farm produce has to be disposed of it is important that that surplus should be a marketable commodity commanding a prompt sale. Perhaps the best course is always to aim at the production of first-class crops, to keep well-bred

animals—not necessarily of pedigree strains, but rather compact sturdy animals calculated to fatten quickly, and not big coarse animals, loose-limbed and of slow growth. For example, there is much difference even among pigs in this respect, and we have always found thick chubby pigs of close compact growth answer best for home use, as well as for bringing to early maturity as porkers for the London market, when they command a special price, always higher than that given for larger pigs.

(To be continued.)

WORK ON THE HOME FARM.

Between the hay and corn harvest the men have been set to hedge-clipping, trimming the sides of ditches, mowing the litter upon headlands, and clearing out stock yards. Several hundred cartloads of ditch scourings, the accumulation of several years' scourings, upon a neglected farm had become overrun with couch grass, and lay in the form of a wide ridge alongside several fields. It has now been carted into large heaps and burnt to destroy the foul grass and to afford a valuable supply of burnt earth and ashes for some land to be sown with Oats next season. A foul layer in process of being broken up and rendered clean for Wheat has been drained. This land is heavy, and much wanted draining; we had men to spare for the work, an old Whitethorn hedge left untrimmed for years afforded an ample supply of stout bushes close at hand, and so we have made bush drains 2 feet deep and 20 feet apart. Pea harvest and the mowing of Winter Oats and Barley is upon us. Peas have to be watched closely as growth ceases, and cutting is begun soon after the pods and haulm begin changing colour, for if this is not done till the seed is fully ripe much of it will be shaken out of the pods in the loading and carting to the ricks. Corn in the southern counties is fast ripening, and the harvest will soon become general. Would it not be well beforehand to consider if some of the ricks might not be made alongside the fields if there is a sound road close by? This would save much carting at this busy season of the year, and the threshing of the corn could be done in due course upon a fine day.

Avoid the expenditure of money upon young cattle unless they are exceptionally well bred, and can be had at reasonable rates; for it is probable that the importation of beef will increase rather than diminish. It is reported that the Marquis de Mores, who is slaughtering and forwarding dressed beef from various points on the Northern Pacific Railroad, offers to supply by way of the Lakes and the Grand Trunk of Canada 1000 carcasses weekly, to be delivered in Montreal at 3½d. per lb. A halfpenny per lb. more will pay steamer and refrigerator charges to Liverpool or the Thames, so that this practically amounts to an offer of beef wholesale in England at 4d. per lb. on board ship. It must not, however, be thought that the actual consumer will obtain this beef at much below 8d. per lb., for the middleman will inevitably step in between him and the ship's side, and the matter is only mentioned as one of many that are likely to tell against the farmer's interests. For our own part we regard sheep as a much safer investment, and we have recently purchased some full-mouthed ewes for folding upon the second growth of Clover. These sheep cost 25s. apiece; they are large animals, somewhat reduced by having been kept late with the lambs; but with a plentiful diet of Clover and mixed corn we may reasonably hope both to improve the land and to sell the sheep fat to the butcher at a profit.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

26th.—A very hot cloudless summer day.
27th.—Hot, bright morning, some cloud in afternoon; cool evening.
28th.—Cool and cloudy, but beautifully bright afternoon.
29th.—Cloudy and cool, but some sun.
30th.—Dull till 11 A.M.; fine afternoon; cloudy evening.
31st.—Dull early; fine midday; cloudy evening.

1st.—Generally dull and cooler.
The temperature on Sunday was unusually high. During recent years temperatures of 90° have occurred only as follows:—

1884, August 11th	92.0 degrees.
1881, July 15th	94.6 "
" " 5th	92.7 "
1876, August 14th	92.1 "
" " 13th	92.3 "
" " July 15th	92.6 "
1874, " 20th	92.6 "
" " 9th	90.8 "

As the latter part of the week was cool the mean for the week not remarkably
The continued entire absence of rain is becoming serious.—G. . SYMONS.

HYPERICUMS.

DURING June, July, and August one or other of the St. John's Worts gladdens the eye with their bright golden flowers, which are large salver-shaped, albeit there is such a centre-filling of anthers that the flowers appear almost globular, and being borne for the most part in dense corymbs or clusters have a telling effect in the summer sun, the effect being enhanced by their ample, somewhat yellow, rich green foliage.

Though they appear well at the time when the sun is strongest, yet they are in a certain sense shade-loving plants, but they are not seen to advantage under large deciduous trees that leave little moisture to minister to the ample foliage and profuse-flowering properties of the Hypericums. Shade of this description they do not thrive in; but if they can have a position where trees from a distance afford shade whilst their roots do not deprive the soil of moisture, so as to interfere with the growth of the Hypericums, then I readily grant they will do exceedingly well, and the bloom be longer than in the full sun. For shady places they are unique, but the less there is of it overhead the better. Hypericums no doubt like moisture in summer, but that they suffer more than other moisture-loving plants in a hot dry time is not admitted. The sum and substance of the matter is that they are low-growing shrubs, and as such are always better by being associated with their taller growing kindred in front of them to the north or south, or so that they will have their sheltering if not fostering aid.

Under ordinary circumstances the open border or shrubbery is the best place for them, and fine they are. They grow freely in any soil not cold and stagnant from water lodging in it, but succeed best in a light or free soil overlying good drainage or gravel, and if enriched with leaf soil or decayed vegetable matter it is better. They form very beautiful bushes in the front of shrubberies, and so choice are they that no herbaceous border kept in a semi-natural state is complete without them; indeed I can see that we must make a great departure in our arrangement of these plants if we desire to see them in all their natural loveliness, with symmetry added by the thoughtful cultivator.

Our soil is light overlying gravel, and Hypericums thrive capitally: they grow well, bloom freely, and spread rapidly. The richer the soil is made the better they seem to like it, but it is safe to opine that in a naturally rich soil they would make too soft late growth, and be liable to be cut down by severe weather. Indeed a good soil needs no addition to have them fine if it is properly prepared by digging or trenching before planting, with an addition of any manurial matter that can be spared as a top-dressing occasionally. Our shrubberies have every particle of decayed matter removed, and rarely does it or its equivalent find its way back as a surface mulching to protect the roots from the winter frost or the summer heat and enrich the soil. But shrubberies are as a rule neglected. They get nothing, not even timely attention in thinning and pruning. They get crowded, and

so become unsightly; but where the shrubbery is cultivated I question if there is any other part of a garden or grounds that with as little care and expense affords such a variety of objects of beauty and interest over so lengthened a period with every shrub given its due amount of space for development. I mention this more particularly to guard others against falling into the common error of planting shrubs without considering that they will need space for development.

Of the many forms of the genus under notice *H. calycinum* forms a dense mass of foliage about 1 foot high, and when covered with its large bright golden flowers is charming, and is admirable for a front position. *H. olympicum* forms a neat symmetrical bush about 15 inches high, not nearly so bold in aspect as *H. calycinum*, as the stems are slender, yet it spreads quickly, a bush 2 or 3 feet across covered with its numerous flowers, and in succession for six weeks, being beautiful. *H. uralum* attains to a height of 2 feet—I have it nearly 3 feet—and is of graceful habit, and the flowers are borne in clusters of about eight, and having great substance last some time, and are very effective. *H. nepalense* is similar to the last, being equally graceful and certainly as profuse flowering, the flowers being a rich golden yellow. Of the same type as the two last named is *H. triflorum*, which grows about the same height, or 2 to 3 feet, the shoots being long and slender and the flower heads depend or droop, which give it a graceful appearance; the flowers are large, over 2 inches, some nearly 3 inches across. It is from Java, and I cannot answer for its hardiness other than on a south border in light soil about 5 feet from a wall 10 feet high, and it ought to be stated that *H. uralum* and *H. nepalense* are in similar positions, and that they are herbaceous, as also is *H. olympicum*. *H. hircinum* is of shrubby habit, and forms a large bush 3 or 4 feet high, which when covered with its clusters of bright yellow flowers, as it is profusely in July or early August, is remarkably effective, and is not at all particular about position, doing well in any ordinary shrubbery. There is a variegated form of *H. hircinum* that is beautiful in foliage as well as flower.

As flowers in shrubberies are not over-plentiful in summer, the claims of this distinct and attractive family of plants appear to merit general consideration.—G. ABBEY.

GRAPE-GROWING AT BATH.

WHAT will some day become a noted vinery has already been described in these pages, but as most of us who are either personally acquainted with Mr. W. Taylor, or have profited by the many excellent instructive remarks upon various topics which he contributed when at Longleat, are doubtless much interested in his present undertaking, further information will not be unacceptable. Mr. Taylor, it will be remembered, has started Grape-growing for Mr. Alderman J. Chaffin, and a grand vinery, in addition to others already established, has been erected in that gentleman's pretty grounds at Larkhall, near Bath. The position chosen is on a rather sharp declivity with a south-west aspect, a great amount of excavation being necessary before the vinery could be built; but there is no doubt the site is highly suitable for Grape-growing, and as Mr. Taylor has long been an expert in ventilating there is no doubt he will fully utilise what might otherwise have proved a source of danger. The structure, though not quite so large as that at Longleat, may be said to be an improvement on that noted vinery, notably with regard to the substitution of top lap ventilators for the more expensive lantern method adopted at Longleat. The length of the house, which is span-roofed, is 140 feet, and the width 30 feet. It is glazed on an excellent imperishable system invented and patented by Mr. Chaffin.

There are three compartments, the central one much the larger. This is the only division yet wholly occupied with Vines. These were struck from eyes in March last year, and planted early in July. The whole of the sunniest side of the

house is planted with Muscat of Alexandria, and opposite to these all the best black sorts in cultivation are being grown. All made most satisfactory progress, but the Muscats grew much the strongest, and in nearly every instance the rods of these at pruning time were left 7 feet long. This season each rod is perfecting two large bunches, besides forming five stout and short-jointed canes. All the black Grapes were cut down to within 14 inches of the ground, and the Vines are carrying one or more bunches, some of which nearly touch the ground. Some of the bunches of Muscats weigh close upon 4 lbs., while Gros Maroc is about 2 lbs., Black Alicante 3 lbs. in weight, Madresfield Court, Alnwick Seedling, Mrs. Pince, Lady Downe's, and Gros Colman being equally good. The Vines are cropped in this young state—that is to say, before they have been planted twelve months, by way of a check to over-luxuriance, and this in preference to allowing the free extension of lateral growth, which plan finds favour with some growers. Every Vine has a lateral space of about 6 feet, and this they will ultimately thinly fill, but at present they are somewhat closely stopped, leader as well as laterals, the length of each rod being about 14 feet, and the consequence will be the formation of grand well ripened rods that will receive little or no shortening back at pruning time.

Another compartment is at present devoted to Tomatoes and fruiting Vines in pots, the latter having attained rather startling dimensions. One of these, a Muscat of Alexandria, I had the curiosity to measure. It was then fifteen months old, and was being fruited in a 19-inch pot. The circumference of the stem near the soil was $3\frac{1}{2}$ inches and $2\frac{1}{2}$ inches at a height of 3 feet, and in addition to perfecting a heavy crop of Grapes had made surprisingly strong leading and lateral growths. The largest bunch, perfectly set, measured 10 inches across the shoulders, 12 inches in depth, and would weigh close upon 4 lbs. Alnwick Seedling was also doing equally well, and this also was perfectly set.

The third compartment is planted with Tea Roses, and these are now large healthy specimens, producing great quantities of bloom during the winter months, which fetch very remunerative prices. Another house is also devoted to Tea Roses, and these, in spite of the very hot and trying weather, were in the cleanest and healthiest state imaginable. The favourite varieties are Isabella Sprunt, Catherine Mermet, Souvenir d'un Ami, Anna Ollivier, Comtesse de Nadaillac, Devoniensis, Jean Ducher, Madame Falcot, Marie Van Houtte, Perle des Jardins, Niphotos, and Souvenir d'Elise.

The Vines in the two other useful structures from which Mr. Chaffin has cut many winning stands of Grapes were, when taken in hand by Mr. Taylor, in rather a poor plight; but thanks to the masterly measures adopted, are now in excellent condition, and bearing heavy crops of medium sized, well set, and otherwise perfect bunches. The borders in this case are outside the house, and no restriction being placed on the roots, these had wandered to a great distance, the principal portion being found fully 40 feet from the house. Under such circumstances it would have been impossible to grow good Grapes, and a severe shortening of the roots was practised, this being done, if I remember rightly, in October, 1883, or while the Vines were in full leafage. A trench was cut at about 6 feet from the stems, nothing but woody old fibreless roots being found. The whole of these were unhesitatingly cut through and relaid in a breadth of fresh compost. The foliage being shaded from bright sunshine, and frequently syringed, was well preserved, and this was the means of inducing the formation of a number of rootlets on the old stumps, with the result of a marked improvement of the crops secured in 1884, and if the Vines continue to improve, as I have no doubt they will do, these also will perfect examples hard to surpass. These renovated Vines also include all the best black Grapes, as well as Muscat of Alexandria, and very serviceable they now are, affording ample proof of the wisdom of the apparently extra severe steps taken to recover them.

The borders of the large new house being wholly inside, they naturally require, and do already receive, great quantities of water; but supplying this, instead of being a laborious operation, is, by an ingenious contrivance of Mr. Taylor's, quite an easy matter. On the upper side of the houses two immense tubs are fixed, both of which hold several hogsheads of water, and one or both of these can be heated by a miniature boiler, to which they are simply connected by a flow-and-return pipe. A good supply of water is constantly at hand or running in, and at a most trifling cost for fuel the whole can be heated to the temperature suited to the borders, and which is conveyed to the different houses through small connecting pipes and distributed with a portable hose. Then, when liquid manure is required, this can also be added to the water in the large tubs and duly run through the houses, and, on the whole a more labour-saving invention could not well be added to this or other establishments requiring plentiful supplies of warm water. That Mr. Chaffin's vinery will eventually become famous I have not the slightest doubt, and all who are acquainted with Mr. Taylor will join with me in wishing him complete success.—W. I.

TEACHINGS OF THE DROUGHT.

THE lengthened and excessive drought of the present season has brought its own lessons, which are worthy of attention. On a couple of these lessons only I would ask permission to say something, and both of these have been learned long ago by old-fashioned gardeners, though perhaps not so much taken to heart nowadays as they ought to be by the younger men. The one is that we cannot succeed in a season like the present unless a system of deep cultivation is carried out; and the other, that farmyard manure is a necessity in this country, whatever it may be in other more favoured lands.

We might have imagined that the benefit of a deep tilth well cultivated would in itself be so apparent that this old-fashioned practice would never be called in question. However, it has been more than once considered an unnecessary feature of garden management. However, those who have for any length of time systematically abstained from cultivating their subsoils, or done nothing to make a good subsoil, must have had enlightenment on the subject in the present year. In our own case we have certain borders and portions of ground which are never trenched, and certain quarters which are duly trenched, and without exception the different treatment the soils receive in these several portions have been as faithfully indicated by the behaviour of the crops as if each had been labelled. And it is not so much a question of degree—the crop on the dug portions just a little worse than that on the trenched ground—but a question of success and failure; for crops have just been as good on trenched ground this year as in previous years. Peas, Beans, Potatoes, young Strawberries, Onions, &c., we have never had better. But, on the other hand, Peas, Potatoes, and very old plantations of Strawberries have been failures on dug ground. Fruit trees tell the same tale, and so do flowers. Roses though short-lived have been fine; Dahlias, in some places making no growth, are here making marvellous plants for the time of year. In only one case have we employed water, and that for the latest sowing of Peas, the ground in this instance having been moistened in order to insure the germination of the seed and again when the young plants were a few inches high. In the case of these and all other vegetables which have been sown or planted we have merely taken the precaution of sowing or planting deep enough for the seeds or roots to get at once out of reach of the dried upper strata of soil. The roots have naturally kept where the moisture was most abundant.

A somewhat curious phenomenon is apparent in the case of trenched ground as compared with ground which has been merely dug, and it is this. In the case of the dug ground the soil became absolutely dry from the surface downwards, while in the case of ground regularly trenched, with the exception of about a couple of inches on the surface, the soil underneath did not become dry to any appreciable extent. In both instances the hoe was duly employed, and no doubt in the latter case it may be presumed to have played an important part in conserving the moisture in the soil, although in the former it had no apparent effect.

The use of farmyard manure may be said to be not so much a gardener's question as one for the farmers, and that is so. But at the same time there can be no doubt that gardeners are inclining more and more to the employment of so-called artificial manures, and against an enlightened use of these we have nothing

to say. They play a most important part in producing good crops. However, we may be allowed once again to point out the danger (which the present summer has done so much to emphasise) of relying entirely upon these as so many farmers do. It would be safe to say that not 10 per cent. of the artificial manure put into agricultural land in this district will ever be returned to the farmer. For the want of rain to present it to the roots in an acceptable form on the one hand, and on the other from the want of roots to make use of the manure—though these points are reciprocal—the greater portion of bought manures have been practically lost. One of the most alluring inducements for farmers to use these has been the promise that, given a certain amount of plant food in the autumn or spring in the shape of these manures, and you are certain to recover their value with increase in the coming crop. The same inducement has been present to gardeners who employ them. The only danger is when farmyard manure is excluded to the reception of these. As I have just said, in a season like the present artificial manures are practically valueless unless water is artificially applied. On the other hand, farmyard manure, especially the more solid portions of it, are of a very great value. Wherever ground has been highly manured for a series of years, that ground has received an addition to its normal constituents, which in addition to other benefits confers the all-important one of retaining moisture in continued drought. And this part, which is played alike by fresh manure and the remaining portion of manure which has in the course of many years been applied to soils, is a fact which strikes at another modern idea, which with a good deal to commend it does not at the same time convey the whole truth in the matter. I refer to the advice often given not to waste manure by placing it out of reach of surface roots. For my own part I would freely advise people who do not trench their ground not only not to bury their manure deeply, but to go so far as to employ the most of it in the form of a mulching to be afterwards dug in; but where a system of trenching is carried out the whole of the operation becomes changed. We are not obliged to confine the roots of vegetables to a few inches of surface soil, susceptible to changes of season, but rather we have provided for them a vast resource out of reach of disturbing elements.—B.

ESTIMATES OF VEGETABLES:

VEGETABLE MARROWS.

In forming an estimate of the different vegetables I think it can only be arrived at by growing them under identical circumstances, and by taking an estimate of their relative value from some clearly defined standpoint. The conditions most valued in vegetables are quality and quantity of crop, the supply being early and prolonged—a certainty of crop of marketable produce. Someone may remark, "But some kinds of vegetables grown in gardens are valued for quality irrespective of crop." I admit taste in private gardens is very often fastidious, capricious, and arbitrary, and has little bearing on the value of crops from a commercial point of view. I think if the latter were to obtain in the values of vegetables prior to their introduction we should have fewer varieties—shorter lists—admitting of easier selection and manifest advantage in cultivation.

I have a piece of ground on which I decided to make a trial of Marrows, testing their values from the prices secured in the market, and although the season is young the results are so pronounced as to render an exposition not unwarrantable. The varieties were sown at one time and in every respect treated alike, with the result that Long White (short-jointed) is a long way ahead, and certainly is the best for market and general use. Next to this comes Moore's Vegetable Cream, the race being close, if, indeed, we ought not to pronounce a dead heat between that variety and Muir's Prolific Hybrid. Neither can compare with Long White, as they have not the taking size, and the number does not compensate for the discrepancy. Beyond Prince Albert, a green variety, there is nothing further worth to note in what may be styled the long or oval varieties; and to sum up these, Long White is very much the best, first through hardiness, second early and continued successional free cropping, and, third, size, quality, and marketable value, in comparison with which the others are nowhere; but from its being large and common is not so much grown in private gardens as its merits demand.

Novelty is something, often everything for the private grower. Because some new variety is different in shape and of small size it is thought to be "tender and delicious," very different to the long "big things" the gardener has grown for years and still persists in growing simply because reliable. Well, novelty is a very good thing in its way, but when it is had at the expense of

something else that answers much better, then I question the propriety of lauding things which, putting novelty aside, have little to recommend them, indeed are indifferent croppers and of so little commercial value as not to be worth growing. What, not Custard? No. Nor yet Pen-y-byd? Then it belies its name—the Best in the World. Of course I shall be set down as prejudiced against everything but what is big and coarse—a lot for little money. This is not the way the grower nor yet the consumer looks at things. They have an identity of purpose—viz., to obtain the most satisfaction to themselves. The grower seeks a crop that will afford the highest market value with certainty, or the least possible risk of failure through adverse climatic conditions; and the consumer is satisfied only with that combining the most for the money along with quality, for there is no more mistaken idea than that anything will take in the market. I have come to the conclusion that consumers are the best judges, setting values upon produce much in the same manner as is done at exhibitions—viz., the finest specimens possessing the highest quality carry off the prizes, and these bring the highest prices in the market. Estimate the Custard, Hibberd's Prolific, Cluster, Bush or Chusan, and Pen-y-byd by the monetary returns, and it will only take a sending or two to convince the most sceptical of the erroneous estimate formed of the value of many things in private gardens from a consumer's point of view, and of no marketable value.

I make no comparison from the other point of view. Those growing for home use may be satisfied with a Lady Apple better than with a Normanton Wonder, with a Golden Harvey as with a Ribston Pippin; but I hardly see the parallel of the comparison, for if we get a dozen small Apples where we get the big one we have a dozen cores and skins to one of the other, decreasing the value of the first relatively to its circumference, whilst the other is increased proportionately in utility.

I ought to say that I put out the Marrow plants in early May under handlights and in the open early in June of all the varieties enumerated, except Custard, and July's returns are taken as the estimate, and so conclusive is it that I could not forbear making it known. What a difference there is between growing for market and for private use—i.e., between growing to pay and to please. Only fancy getting 3s. 6d. per dozen for Long White and 1s. for Pen-y-byd, and more of the former in number than of the latter; and what is most remarkable of all is the Long White so long despised is now considered the best for table use. Is this a forecast that we are going to cast prejudices to the winds and have a thorough weeding out of many things that only perplex in name or number and cumber ground in gardens? Anyway, I am a thorough convert to utilitarianism in gardens, and hope to give you an estimate of other things from a like point of view, contingent, of course, on your finding a place for this first attempt of—UTILITARIAN.

MR. JAMES CUTBUSH.

I AM sure the severe shock I received on reading of the sudden death of my valued friend, Mr. Cutbush, will be shared by all who knew him, and that will be by a very large circle indeed, for no man was more widely known. For myself, I can truly say that among the many friends whom it is my privilege to count amongst professional horticulturists there is no one whom I have more learned to value and esteem, and no one whom I shall more sorely miss. I have had the pleasure of his friendship for a great many years. We have been associated together in many things, and the feeling that I shall never again be able to return his ever cheery greeting is to me a very painful one.

For a long number of years he has been associated with the successful culture of the Hyacinth, and in years gone by his name almost always headed the list of prizeholders, and he was, I believe, the originator of what has become a very common practice now—having exhibitions at his own nursery when his bulbs were in full bloom; but although these were the most noted portions of his culture, his nurseries were always up to the mark and all his plants well cared for.

In his private life no one was more thoroughly esteemed. A staunch member of the Church of England, and with a kindly feeling towards Christians of all denominations, he was ever ready for any good work which had for its object the welfare of those around him. A warm friend and a cheery companion, he always brightened any company into which he was cast; and although of late years delicacy of health, anxiety about business, and the increasing infirmity of deafness tended to chasten his exuberant spirits, yet they did not rob him of his pleasant and genial ways.

He was a loving husband and affectionate father, and his death must have been a heavy blow to his family, but for himself what more happy one could there be? He was engaged in one of those works of kindness in which he always took delight. He had frequently expressed to me his opinion that his life was very precarious, and I do not think it would have been a surprise to him that death was at hand. This year has been fatal to horticulture; George Baker, Charles Turner, and James Cutbush are

no common loss to the cause the readers of this Journal have so much at heart.—D., *Dial*.

PUSCHKINIA LIBANOTICA COMPACTA.

THIS small genus of Liliaceæ according to Baker's monograph includes only two species—*i.e.*, *P. scilloides* and *P. hyacinthoides*. They are closely allied to *Scillas* on the one hand and *Ornithogalums* on the other, the habit and general appearance of the plants coming much nearer the former.

P. scilloides, under which is included *libanotica*, typical, the variety illustrated in the accompanying drawing, and also *scilla* figured in the "Flore des Serres," is amongst the most welcome of our early spring-flowering bulbs, coming in early in March and lasting until the end of April, a time when flowers are most wanted. *P. libanotica* is not unlike *Scilla amoena* in habit, about 6 inches high, throwing up two or three radical narrow lanceolate leaves, and sheathing the flower stem a third of their length. The flowers are collected in a loose cluster or corymbose head, a little larger and deeper in colour than the ordinary *P. scilloides*.

Fig. 22.—*Puschkinia libanotica compacta*.

In the variety *compacta* the head is dense, flowers more numerous, and having a more distinct blue-coloured midrib running up each segment. Dotted here and there on the rockery or mixed border, they look very gay during their season, and we hope to see them treated in the same way as the *Crocus* and *Daffodils* in the woodlands.

Like several other bulbs of similar habit the *Puschkinias* can also be grown in pots with advantage, and if introduced into the conservatory or greenhouse they are useful for arranging in the front of the shelves or stages. When treated in this way they are preferably grown several in a pot, like the *Scillas*, for otherwise they do not produce so good an effect.—M.

PEACHES OUTDOORS.

WE may fairly suppose that the young shoots have gone through the processes of "thinning out" and training; also, that gross shoots have been pinched or stopped. In the early part of the month the fruit commences its last swelling, or, in southern counties, in the latter part of July; and this is the time I select for what may be termed a general stopping of the young sprays. This I have practised for years, and see no reason to depart from it. One effect speedily follows this procedure; that portion of the foliage which had been but recently produced attains a full development, and, of course, is in a position to add to the productive stores of the tree instead of taking from them. We all know that good

Vine-dressers do not encourage the very latest growth on their Vines; they pick them away, for reasons very similar to those urged for the Peach and Nectarine.

It may be readily imagined that stopping the enlargement or extension of a deciduous tree, in July or August, by checking all excessive demands for the ascending sap, must tend to a solidification of the wood; and the latter we call ripening. Since, however, it is seldom that all portions of a fruit tree are equally balanced as to strength, this is the very occasion to establish an equilibrium as far as art can effect it. It so happens that this stopping is highly conducive to this end, when managed judiciously, as I have often proved. Of course, as a general principle, the pinching a shoot in full growth has a direct tendency to stop its enlargement. If anyone doubt this, let him take some plant or tree on which to try the experiment; let him select two boughs, and pinch the one, and leave the other unpinched—such, followed up through a couple of years, will soon convince him of the truthfulness of this point.

Now, judicious "stopping" I have for many years made the groundwork of all attempts at equalising the power of the branches of Peach and other fruit trees. We have stopped the point of every shoot which needed no farther enlargement, and have equally refrained from stopping those which required an accession of sap, to bring them into a position to compete with the superior branches. I urge that all pains be taken to ripen the wood as well as fruit during the month of August. It is scarcely too much to affirm that on this month, more than any other, depends the success of the ensuing year.—E. R.

THE HISTORY OF THE CHRYSANTHEMUM.

(Continued from page 105.)

RETURNING to Mr. Salter, we learn that at the period first mentioned in this chapter (1850) the flowers most frequently seen in the exhibitions which are still with us were *Annie Salter*, *Beauty*, *Christine*, *Nonpareil*, *Phidias*, *Queen of England*, &c., and that a great improvement had taken place in the interval of some fifteen years after that date.

Among the principal attractions in the great metropolis during the late autumn months the exhibitions of the *Chrysanthemum* at the Inner Temple must not be omitted. Here there are some thousands of these plants handsomely and effectively arranged in the two glass houses under the respective care of Mr. Newton and Mr. Wright. The former is well known among all *Chrysanthemum* growers as the able successor of Mr. Broome, while the latter occupies the position formerly held by Mr. Dale; and although it is generally believed that Mr. Wright is a comparatively young grower, it is a matter of fact that the extent of his show and the number and quality of his flowers were, last season, quite on a par and as well deserving of complimentary notice as those of his rival. In 1859 the number of varieties grown at the Temple are stated to have been 500, but this is probably a very much smaller number than that which the two exhibitions comprise nowadays.

The collection possessed by Mr. Salter in 1860 amounted to 750 distinct varieties, of which no less than two-thirds were large-flowering kinds, 150 of them having been raised in England, and the remaining one-third were *Pompons*, mostly of French origin.

The chief events in the history of the *Chrysanthemum* have now been brought down to something like a recent date, and as yet the florists of England, France, and the Channel Islands had by careful cultivation produced varieties of a far superior type to anything yet imported from the far east. As a matter of fact, it is extremely doubtful whether it had been considered necessary for the past thirty years or so to introduce anything of the kind from China or Japan excepting the two small-flowering *Pompon* kinds introduced by Mr. Fortune. There was, however, in Mr. Salter's opinion still room for further improvement, and others were also inclined to think so, especially in the varieties not of a white or yellow colour. He says, "Let it not, however, be supposed that this plant has now attained to such a degree of perfection as to leave no room for further improvement. Many additions are still necessary before even our ideal can be reached. . . . The improvements which have already taken place warrant the belief that much more may be achieved, and no enterprising florist will rest satisfied until he sees combined with perfection of form that diversity of colour which at present only exists in his imagination." It is doubtful whether at the time he wrote those prophetic words he was aware of the earliest efforts of a French florist who at that very time was commencing the culture of the *Chrysanthemum*, and who was destined to become in his own particular section the greatest rival Mr. Salter or any other individual raiser ever had, and to whom fuller reference will be made a few pages further on.

Somewhere about the year 1860-2 that enterprising plant collector and traveller, Mr. Fortune, introduced from Japan seven varieties of new and distinct kinds, which he, with his usual intuition in matters of this sort, felt certain would create almost a revolution in the *Chrysanthemum* world. In describing his discovery of them he says of the town of Ah-sax-saw that this place "is most famed in the vicinity of Yedo for the variety and beauty of its *Chrysanthemums*."

At the time of our visit they were in full bloom, and most certainly would have delighted the eyes of our English florists had they found themselves so far away from Hammersmith, the Temple, or Stoke Newington. I procured some extraordinary varieties most peculiar in form and in colouring, and quite distinct from any of the kinds at present known in Europe; one had petals like long thick hairs of a red colour, but tipped with yellow, looking like the fringe of a shawl or curtain; another had broad white petals striped with red like a Carnation or Camellia, while others were remarkable for their great size and brilliant colouring. If I can succeed in introducing these varieties into Europe they may create as great a change among Chrysanthemums as my Chusan Daisy did when she became the parent of the present race of Pompons." It is at this place that the Chrysanthemum, the national flower of Japan, is honoured every year by a special imperial garden party in the palace grounds. We are told that the Chrysanthemums here are unequalled throughout the world, and that some of the plants display from 375 to 430 fully developed blooms at a time.

Mr. Salter, of course, took them in hand, and succeeded in raising a few new varieties, while the Channel Islands growers, Mr. Downton and Major Carey, also added to the number within a very few years. It was, however, reserved for the French florists to make the very rapid strides in the improvement of this class of Chrysanthemum that has taken place, and the enormous number of novelties they have sent out in the past few years show how highly they appreciate the weird fantastic form and brilliant colours that distinguish the more recent productions. We can only give vent to a deep-drawn sigh of regret when we think what they might do if they could only be persuaded to deal with the incurved section in the same marvellous way that they have handled the Japanese; and it is also a matter of curiosity that the French, with their refined taste in so many other things, should look down upon the incurved section with what appears to be almost utter disregard of its beauty.

We have heard that the Japanese varieties had long been cultivated in Portugal previous to their introduction into England, but there is some little probability that those so referred to were more likely to have been varieties of the older Chinese Chrysanthemums, some of which had long loose tubulated petals with which our own florists were well acquainted about the year 1826, as several of those sorts bore so great a resemblance to the modern Japanese, and which if in cultivation to-day would be unhesitatingly placed in that section.

Up to 1865 the influx of the new varieties of incurved, reflexed, and large Anemone flowers continued, and many of our favourites made their appearance up to that date; some of them, such as Antonelli, Belladonna, Beverley, Cherub, Cleopatra, Dr. Brock, Emperor, Empress, Eve, General Bainbrigge, Golden Eagle, Golden Beverley, Her Majesty, John Salter, Lady Hardinge, Lady Slade, Lady Margaret, Little Harry, Miss Margaret, Mr. Brunlees, Mrs. Haliburton, Mrs. Pethers, Nil Desperandum, Prince Alfred, Queen Margaret, Venus, and White Christine being still worthy of mention.

The Chrysanthemum was now probably a more popular flower than ever. Societies had sprung up all over the country to encourage its culture, and besides the numerous local shows and those at the Temple, Mr. Salter's annual exhibition at Hammersmith and Mr. Adam Forsyth's at the Brunswick Nursery, Stoke Newington, were thronged during the month of November by thousands of admirers of the Chrysanthemum.

The new seedlings distributed between the date last mentioned and the year 1870 comprised among Pompons and other sorts Gloria Mundi, Golden Beverley, Dr. Lindley, Ossian, Golden Dr. Brock, Baron Beust, Lady Talfourd, Lord Derby, Faust, Fingal, Isabella Bott, Mrs. Heale, Mrs. Geo. Rundle, Pink Perfection, Rival, Little Harry, Beethoven, White Eve, Plenipo, Orange Annie Salter, all of which are tolerably familiar to us growers of the present day. At the same time it must be remembered that a large number of varieties had been raised, appreciated for a while, and then had gradually disappeared from cultivation, and as there can be but little interest in these it has been considered unnecessary to burden the reader with long lists of varieties no longer known.

We are now approaching the close of the history of a plant that is even now supposed by some to be in its infancy, and before reaching the conclusion of this treatise it will perhaps be permissible to make some slight reference to the subject of sports, as many of our well-known flowers have been obtained in that way. Without attempting to explain the scientific reasons for so curious a variation, a task for which the writer is by no means competent to deal with in a proper or scientific manner, it may be observed that there are numerous plants subject to the phenomenon of sporting, but that there seems to be none so liable to it as the Chrysanthemum. It is not, of course, every kind that sports so freely as others, and from what we can learn nearly all the early imported varieties from China were much more inclined to do so than the majority of those since raised

from seed; the old purple, the expanded light purple, the quilled light purple, the curled lilac, and the buff seem to have been those most sportive in the olden time. There are, too, many cultivators who have never in the course of a lifetime devoted to the culture of the Chrysanthemum been so fortunate as to secure one. A sport is defined by Mr. Beaton, no mean authority, as he lived in a time when some of the greatest changes were made in this popular flower, in something like the following words—viz., that a branch here and there would occasionally give flowers of a different colour from the rest, and when cuttings were instantly made from the sporting branch the new colour (and occasionally, though rarely, the new form) would follow and become permanent. The first sport noticed and fixed in this country originated from the old purple, the plant first introduced in 1790, in the garden of the Bishop of London at Fulham. This was treated in the way described above, and was called the Changeable White Chrysanthemum. Mr. Mean, gardener to Sir Abraham Hume, tells us that it occurred in the year 1802. There are many varieties now in cultivation which were obtained by this means, and most of us are aware that even sports will in their turn produce new flowers in the same way. Among the principal flowers that originated by this curious and interesting variation the following are fairly well known.

Alfred Salter	from Queen of England
Angelina	" Lady Slade
Barbara	" Barbara
Bronze Jardin des Plantes	" Jardin des Plantes
Canary Yellow Cherub	" Cherub
Emily Dale	" Queen of England
Geo. Glenny	" Mrs. Rundle
Golden Andromeda	" Andromeda
Golden Aurora	" Aurora Boreale
Golden Beverley	" Beverley
Golden Cedo Nulli	" Cedo Nulli
Golden Christine	" Christine
Golden Dr. Brock	" Dr. Brock
Golden Empress of India	" Empress of India
Golden Geo. Glenny	" Geo. Glenny
Golden Hermione	" Hermione
Golden Queen of England	" Queen of England
Golden Trilby	" Trilby
Hero of Stoke Newington	" Princess Teck
Lady Selborne	" James Salter
Lord Wolseley	" Prince Alfred
Miss Jeannie	" Anna de Belocca
Miss Oubridge	" Mdle. Marthe
Mons. Harman Payne	" Marguerite Marrouch
Mr. Bunn	" Golden Beverley
Mr. Cobay	" Prince of Wales
Mr. Bateman	" Miss Walker
Mr. W. Piercy	" Madame Pecoal
Mrs. Bateman	" Miss Wheeler
Mrs. J. Crossfield	" White Globe
Mrs. Heale	" Princess of Wales
Mrs. Marigold	" Miss Mary Morgan
Mrs. Shipman	" Lady Hardinge
Mrs. Todman	" Leon Lequay
Mrs. Weston	" White Venus
Nellie Rainford	" Rosinante
Niobe	" Nil Desperandum
O-Kiku	" Bismarck
Orange Annie Salter	" Annie Salter
Rotundiflorum	" Beverley

White Queen of England	" Queen of England
White Trevenna	" Rose Trevenna
W. Robinson	" Bouquet Fait.

and others.—C. HARMAN PAYNE.

(To be continued.)

PRUNING FRUIT TREES IN SUMMER.

I DO not believe in beginning this until August. It may be done earlier. Some practise it in June, and many in July, but I am not one of these. When it is done early, and when the shoots are in full growth, in my opinion more harm than good is done. Any shoot which has the top cut off it when it is in full growth immediately throws out a number of young shoots from the buds below where the cutting-off took place, and in the place of having one shoot, as was the case in the first instance, from one to a dozen will come in a cluster, and it is this which is most objectionable. In such a crowd of wood and leaves there will be neither fruit buds nor wood buds of any value formed for another year, and to secure these is the only object to be kept in view in summer pruning. By this time, or a little later, all the shoots have become very firm and pretty well ripened, and when cut back they do not rush into growth again, but the buds, which are more exposed than they were before cutting the tops away, develop more fully, and mature thoroughly into fruiting or leaf buds of the highest quality for next year. This is how we look on the matter, and what we find answer best in practice. No doubt the majority of your readers will understand summer pruning,

but some may not, and we may as well remark on it briefly. All fruit trees which have formed many young shoots lately will be now bearing much superfluous wood, as these shoots if left on until winter would have to be cut off then, but by doing it now the advantages just noted above will be secured. Where it is desired to extend the trees the main growths may be left almost their full length, but where fruit spurs are desired each shoot should be cut in to within 2 or 3 inches from the bottom. Where the shoots are crowded the majority should be cut closer in than this, and only one or two should be left a little longer than the rest. We are just beginning the work now, and will go over the Plums, Pears, Apples, and all the other trees requiring attention, both on the walls and in the open quarters. When carefully done summer pruning lightens the work of winter pruning considerably, and benefits the trees much more.—A KITCHEN GARDENER.

SPECIALTIES AT THE ANTWERP SHOW.

In the notes given last week the leading features of the Exhibition were indicated, but a few of the special classes require some supplementary remarks, which may be most appropriately given under their respective class headings.

BRONELIADS

The large distinct family of American plants—the Bromeliaceæ—is much more extensively represented in continental nurseries and gardens than it is in England, where, outside botanical collections, few are seen in general cultivation. In Belgium a great number of species and varieties are, however, grown, some being as remarkable for the brilliant colour of their flowers or bracts as others are for their curiously marked foliage; and, therefore, a good and representative display was exactly what would be expected at such an exhibition as that just concluded at Antwerp. Not only was this the case in the classes specially provided for them, but in the miscellaneous groups and amongst the new plants they figured prominently. There are some species which are unquestionably ornamental, and there are many others which can only be considered as curious, but our English collections might well be extended by the addition of several fine species. The principal collection was that of twenty-five species, with which the Etablissement St. Dorothée, Ghent, gained the gold medal, value 100 francs. This included some large and handsome plants, very notable being *Tillandsia tessellata*, about 4 feet in diameter, with the leaves beautifully "tessellated." The well-known *Chevalliera Veitchii* was in similar fine condition, and *Pourretia argentea* is distinguished by its narrow, silvery, spiny-margined leaves. *Vriesia fenestralis* and *Mas-sangea musaica* were both noteworthy for their prettily marked foliage, *Vriesia Pastuchefiana* and *V. Binoi*, but especially the latter, being distinguished by their strong leaves 3 to 4 feet long. These were the most remarkable in the collection, but several others of slightly less merit were included, and in the group of ten with which the same "établissement" gained the leading prize were several handsome *Nidulariums*. Very striking amongst these was *N. anthocrater*, which has very broad, bold leaves, the shorter central ones being of a purplish mauve tint. The rich red *N. Meyendorfi* with *N. pictus* and *N. princeps* were prominent objects, the useful *Echmea fulgens* and *Billbergia rhodocyanea* also adding to the interest of the group. M. A. D'Haene and M. Moens also contributed creditable collections, comprising most of those already named, and, in addition, *Anistrum eburneum*, a rare species with green leaves, upon which were numerous darker spots. All the species with variegated leaves are ornamental, and are generally the most admired, and such might well be added to English collections, for they are easily grown and bear much rough treatment when employed for decorative purposes.

BERTOLONIAS, SONERILAS, AND ANÆCTOCHILUS.

The *Melastoma* family furnish us with several pretty foliage plants, but amongst the best of all, and ranking with these gems of the Orchid order, the *Aræctochilus*, are the *Bertolonias* and *Sonerilas*, which are worthy of cultivation wherever beautiful plants are valued. These also in Belgium are specialties with several nurserymen, and particularly at M. Louis Van Houtte's establishment, where a good collection of varieties is grown. They are generally green spotted with silver in the case of the *Sonerilas*, and in the *Bertolonias* rose spots or veins often take the place of the silver markings in the others. M. L. Van Houtte secured the silver-gilt medal in the class devoted to these plants with some charming little specimens tastefully arranged in a glass case with *Selaginellas*. The best of the varieties were *Bertolonia Ohlendorfi*, B. *Rodeckiana*, B. *Van Houttei*, and B. *marmorata*, the last named having dark green and silver-veined leaves; of the *Sonerilas* *S. margaritacea* and *S. Hendersoni marmorata* were the best. M. P. F. Boutmans also had so good a collection that a silver-gilt medal of equal value was awarded him by the Jury. His plants were very healthy, and comprised good examples of *S. Alfred Mame*, deep green spotted with silver; *S. Baronne de Marches*, lighter green with silver spots; *S. Lili*, a pretty variety, of a uniform silvery appearance; and *S. Nelly*, heavily blotched with silver on a dark green ground. The chief *Bertolonias* were B. *gutta rosea punctatissima*, clearly spotted with bright rose, and B. *Echauti*, which has narrow light green leaves veined with silver.

One small but lovely collection of *Anæctochilus* gained M. Vanden Driessche, Ghent, the premier award—a framed silver-gilt medal—in the class provided for them. The plants were as fresh and healthy as could be wished by the most fastidious cultivators, and such as many would be delighted to see in British gardens where weakly leafless examples are rather the rule than the exception. In the collection named *Lowi*,

argenteus, *macodes*, *petola*, *Dawsonianus*, and *pictus* were the most beautiful in the colouration of their foliage.

PALMS.

It would be impossible to estimate the number of species or varieties of Palms represented in the various classes, and the number of specimens would amount to many hundreds, from those a foot high to the giants of 14 to 20 feet, with great spreading fronds forming a little tropical forest. In the central portion of the pavilion the Compagnie Continentale had some remarkably handsome specimens which, though not in competition, amply merited the honorary award of a gold medal, which was the recognition accorded them by the Jury. A dozen large plants were contributed, but amongst them was a pair of *Corypha Gebanga*, a particularly handsome Palm, which when of the size these had reached—namely, 12 or 14 feet in height, is both imposing and elegant, the leaves being fan-shaped, with long drooping points. Most of the others were better-known species, such as *Livistona australis*, *Rhapis flabelliformis*, *Areca sapida*, *Areca Baueri*, and *Kentia rupicola*, all handsome graceful plants of similar size to the two previously mentioned, and though surrounded by many other fine Palms, these stood out prominently. That superb species *Pritchardia grandis* was admirably shown by several exhibitors, but especially by MM. Dallièrre and Moens of Ghent, each of whom had plants of considerable size, with large well-developed fronds. Some good examples of *Cocos Bonneti* were contributed, but one from M. Spae, Ghent, about 12 feet high, with long slender graceful leaves, was uncommonly beautiful, M.M. De Smet Frères also having a specimen almost as large.

The ordinary *Kentias*, *Areca*, and *Cocos Weddelliana* were necessarily in strong force, and formed what may be termed the foundation of the Exhibition, but there were also numbers of rarities in addition to those already named. These were especially noticeable in the classes for new and rare Palms, in which M. Auguste Van Geert succeeded in gaining the premier prize of a gold medal for the following:—*Ravennea Hildebrandti*, *Pritchardia grandis vera*, *Chamaedorea Douranowi*, *Areca Dicksoni*, *Licuala uspenskyi*, *Pritchardia Moensi*, *Areca Kasarinei*, *Calamus Kentiaformis*, *Calamus trinervis*, *Pinanga Sanderiana*, and a *Korthalsia* from Borneo. M. D'Haene, who followed in this class, also had some good examples of rare species. M. Moens was the only exhibitor of twelve new or rare Palms in the amateurs' class, and he was awarded the gold medal for vigorous plants, of which the following were the most noticeable. *Pritchardia grandis*, *Licuala grandis*, *Kentia Luciani*, *Ravennea Hildebrandti*, *Calamus viminalis*, *Arenga Moensi*, *Brahea havanensis*, *Thrinax Chucol*, *Pritchardia Vnylstekiana*, and *Wallichia Moensi*. M. Dallièrre also had a collection which comprised several not named in the preceding, and they are therefore worth mentioning. The most distinct were *Phoenix Andersoni*, *Cocos flexuosa variegata*, *Williamia speciosa*, *Calamus caliocarpus*, *Thrinax graminifolia*, *Phoenix graminifolia*, and *Phoenix hybrida*. Several of these are unknown in British gardens, and in any case will continue scarce for many years to come; in fact there was not one that specially impressed us as being likely to supersede the best of the forms now so largely grown for decorative purposes. However, where a collection is being formed, and the object is to render it as complete as possible, they should all be included, for they possess the attractions which graceful or bold foliage always furnishes.

NOTABLE PLANTS.

A circular group of a variegated *Dracæna* from M. de Craen-Longhé attracted much attention, and the plants were suitably honoured by the award of a framed silver-gilt medal to the exhibitor. It was named *D. Douceti*, and was by some considered as a variegated *indivisa*; the plants differed, however, considerably from the ordinary *indivisa* in the leaves being much more narrow and stiffer, more like the *Yucca aloifolia*, but more graceful than that species. The leaves were also distinctly striped lengthways with green and white, the contrast being very clear, and there can be no doubt that the plant will become a favourite for decoration, as its habit is strong and compact without being too rigid. A silver-gilt medal was also awarded to M. Juchem, Vieux Dieu, for *Dracæna lineata variegata*, which was somewhat like the *D. Douceti* just described, but the leaves were slightly broader with a rather more distinctly marked variegation. It is, however, a decidedly ornamental plant, and either in a large or small state would be useful for many purposes. In the same class a plant of *Zamia tonkinensis* was exhibited by MM. Wartel frères, a very distinct Cycad, and one of the most graceful of the family; the leaves are pinnate, the pinnæ narrow, about half an inch wide, with the margin very neatly and regularly undulated; the general habit is also less formal and stiff than usually prevails in the family. Under the larger class for new plants, *Pandanus D'Haenei* was noted last week, but it was shown by so many exhibitors in this section that it deserves some additional attention. It is a very distinct species, and when the leaves under cultivation attain the size of the dried specimens (4 to 5 feet long and 9½ inches wide) which were shown with the plants, they will have a remarkable appearance. The slight glaucous colouring of the foliage also adds to the attractions of the plant, and the introducer, M. D'Haene of Ghent, has the satisfaction of seeing his name attached to a very distinct *Pandanus*.—L. CASTLE.

(To be continued.)

A ROSE GARDEN.

I HAVE a large lawn, sheltered but not overhung by trees, which I think will be excellent for a Rose garden. I shall be glad if you can give me some idea how to form the beds and the sorts of Roses to grow.

The position is 60 yards long, and about 40 wide, so will hold a large number of Roses. For any information I shall be obliged.—A. B. WELTON.

[The following plan and method of planting the Rose garden at Mentmore will form an "idea," but the design can be modified to suit the position.

As will be seen by reference to the plan and mode of planting, the system has been adopted of massing the very dark varieties together, such as the crimsons; also the deep pinks, pale rose colours, or white or very light Roses in separate beds, the groups being arranged so that the colours are seen to the best advantage, and that the due balance of the design is maintained. The central bed alone is planted in mixed colours, so that the surrounding beds are rendered more distinct. The beds are all on grass. The soil was taken out 3 feet deep, and fresh soil, consisting of three parts of fine old turf and one part of decayed cow dung, was employed for the Roses. After the Roses were planted in February a good mulching of rich dung was given to the beds.

The Rose garden is 130 feet in length by 88 feet in width, the round beds being 9 feet in diameter, and the segments of circles 4 feet. A is a 6 feet gravel walk all round. This walk is covered with an iron trellis 9

No. 5, *Lælia*, *La Reine*, François Michelin, Peach Blossom, *La France*, Madame Chirard, Mdle. de Stella, Souvenir de la Reine d'Angleterre, Duchess of Sutherland, Baronne Prevost, André Dunand, Princess Beatrice, Duchess of Edinburgh, and Michel Bonnet.

No. 6, Mdle. Thérèse Levet, Anna Alexieff, Mons. Woolfield, Baronne Prevost, Abel Grand, Madame Georges Schwartz, and Baronne de Rothschild.

No. 7, Alfred de Rougemont, Duke of Edinburgh, Prince Camille de Rohan, Fisher Holmes, Prince Humbert, Duc de Wellington, Comte Raimbaud, Baron Haussman, and Duchesse de Caylus.

No. 8, Duke of Edinburgh, Baron Bonstetten, Jean Cherpin, John Keynes, Black Prince, St. George, Pierre Notting, and Lord Macaulay.

No. 9, Princess Louise Victoria, Queen Victoria, Olga Marix, Madame Rivers, Coquette des Blancs, Caroline de Sansal, and Madame Lacharme.

No. 10, Lady E. Peel, Mdle. Maurin, Boule de Neige, Mdle. Bonnaire, Amelie Hoste, Thyra Hammerick, and Coquette des Blancs.

No. 11, Boule de Neige, Louise Darzens, and Caroline de Sansal.

No. 12, Thyra Hammerick, Amelie Hoste, Elise Boëlle, Gonsoli Gaelano, and Duchesse de Vallombrosa.

Fig. 23.—ROSE GARDEN AT MENTMORE.

feet high in the centre, and the trellis covered with climbing and other Roses. B is the border where the Roses are planted for climbing over the trelliswork. C is a grass sloping bank, so that the walk is about 18 inches higher than the Rose beds. The dots on the plan represent standard Roses. The Roses for the beds were supplied by Messrs. W. Paul & Son of Waltham Cross. Some are on their own roots, and some on the Manetti stock. All have grown and flowered well. The situation is high and open to the south and west, but sheltered from the north and east. The mode of planting the beds is as follows:—

Bed No. 1, Général Jacqueminot, Beauty of Waltham, Leopold Premier, Maréchal Vaillant, Glory of Waltham, Mdle. Marie Rady, Madame Charles Wood, Firebrand, Etienne Levet, Sénateur Vaisse, François Louvat, Charles Lefebvre, Maurice Bernardin, and Dr. Andry.

No. 2, Mdle. Marie Rady, Duke of Edinburgh, Charles Turner, Comtesse d'Oxford, Princess of Wales, Paul Verdier, Dupuy-Jamain, Mdle. Annie Wood, Alfred Colomb, Prince de Portia, Jean Lambert, Star of Waltham, and Queen of Waltham.

No. 3, Général Jacqueminot, Maréchal Vaillant, Sénateur Vaisse, Beauty of Waltham, Glory of Waltham, Dupuy-Jamain, Comtesse d'Oxford, Dr. Andry, Firebrand, Baron Haussmann, Maurice Bernardin, Etienne Levet, and François Louvat.

No. 4, Mdle. Marie Rady, Paul Verdier, Princess of Wales, Duke of Edinburgh, Comtesse d'Oxford, Dupuy-Jamain, Mdle. Annie Wood, Alfred Colomb, Exposition de Brie, Queen of Waltham, and Star of Waltham.

No. 13, Beauty of Waltham, Mdle. Decour, Madame Victor Verdier Camille Bernardin, La Brillante, Docteur Andry, and Charles Turner.

No. 14, Ferdinand de Lesseps, Madame Charles Crapelet, Alfred Colomb, Général Jacqueminot, Antoine Ducher, Duke of Edinburgh, Comtesse d'Oxford, Madame Charles Wood, and Prince Eugène Beauharnais.

No. 15, Beauty of Waltham, Camille Bernardin, Prince de Portia, Madame Decour, Madame Victor Verdier, La Brillante, Prince Camille de Rohan, Dr. Andry, Charles Turner, and Mdle. Marie Rady.

No. 16, Ferdinand de Lesseps, Maréchal Vaillant, Madame C. Crapelet, Duke of Edinburgh, Exposition de Brie, Alfred Colomb, and Comtesse d'Oxford.

No. 19, Madame Chirard, Reine du Midi, John Hopper, Jules Margottin, Anna Alexieff, Queen Eleanor, Madame Scipion Cochet, Madame Boll, Edouard Morren, and Paul Neyron.

No. 20, Paul Neyron, Paul Verdier, Baronne Prevost, John Hopper, Perfection de Lyon, and Magna Charta.]

HARDY FLOWERS AT KENSINGTON.—An extensive and beautiful display of hardy flowers is being maintained at South Kensington by Mr. T. S.

Ware of Tottenham, and fresh batches of flowers every day keep the exhibition constantly attractive. Just now Lilliums are very largely represented, especially the much-admired *L. auratum*, together with several varieties, and the old well-known but useful *L. tigrinum* is equally fine. *L. longiflorum* and others are numerous represented, together with a choice selection of the best summer-flowering plants.

GARDENERS who have changed their situations since the last edition of the "Horticultural Directory" was published, are invited to send without delay their new address to the Editor of the "Horticultural Directory," 171, Fleet Street, London, E.C., so that it may be inserted in the forthcoming edition.

A MEETING was held at South Kensington on Tuesday last to form a Committee in connection with the proposed CHARLES TURNER MEMORIAL FUND. It was resolved that, in consideration of the great services rendered to floriculture by the late Charles Turner, a fund should be raised, the interest on which should be given as prizes for florists' flowers at such shows as should be selected by the Committee. Mr. H. M. Pollett was appointed Treasurer, and Mr. J. Douglas Honorary Secretary.

A MANCHESTER CUCUMBER GROWER desires the address of "H. H., York," who communicated a note on Cucumbers in our issue of July 16th, 1885. If our correspondent has no objection to comply with the request he can forward his address to this office.

GRAND NATIONAL DAHLIA SHOW AND THE TURNER MEMORIAL PRIZE.—The Committee for managing this Show have decided that the prize referred to on a former occasion shall consist of a ten-guinea silver cup, the objects of competition to be twelve Show and six Fancy Dahlias. The cup is to be competed for by amateurs only, and must be won three times before it becomes the property of the winner. Further particulars will be announced.

A FIRST-RATE Grape-grower observes:—"The more we see of ALNWICK SEEDLING AND GROS MAROC GRAPES the better we like them. In looking through a vinery the other day we were pleased to see both in fine condition as regards size and finish of bunch and berry. The former variety, growing on a Lady Downe's stock, is found to set as freely as Black Hamburgh, upon which stock the Gros Maroc is doing admirably in every respect; the flavour which, when the Vine is grown on its own roots, Trebbiano, and such varieties, is spoken of as being 'coarse,' 'third-rate,' &c., is nearly as good as that of well-ripened Hamburgs—the result, no doubt, of the union with that excellent variety. Let those who are dissatisfied with Gros Maroc on account of its flavour inarch it on to a Black Hamburgh stock, and there will be no further cause for complaint providing the treatment be good."

MR. IGGULDEN sends us the four useful notes following on Roses, Apricots, Tomatoes, and Spinach Beet. Short notes of a similar character on noteworthy subjects are acceptable from all who can obligingly contribute them from time to time.

A HOT WEATHER ROSE.—The hot weather has proved very trying to the Roses, and cut blooms are now very scarce. There is one noteworthy exception to the rule, this being the good old Bourbon Souvenir de la Malmaison. This variety, whether against sheltered walls or as dwarfs in the open, invariably flowers early and abundantly, and during August and till frost intervenes we are rarely without plenty good blooms or buds of it. The blooms, pinkish white in colour, are not of very good form, especially when fully expanded, but they last well, very few other sorts equalling them in this respect. On the whole I consider it one of the most serviceable Roses in cultivation.

AMONG Apricots there are none to surpass the Moor Park for quality, but unfortunately this variety is much given to gumming, whole limbs frequently dying back in consequence. Hemskerk is rather earlier, possesses a good constitution, crops well, and the fine tempting looking fruit are of good quality. It rarely fails with us, and if one or two trees were grown Hemskerk would be the variety selected.

READING PERFECTION TOMATO.—This variety is much liked in the neighbourhood of Frome, and I have seen very fine crops of it both in the open and under glass. Particularly good are the large clusters of it in the late vinery at Fairlawn, the Frome residence of John Bailly, Esq., and I should say it would be a difficult matter to find much handsomer fruit. They are very solid, smooth, round, and a bright rich red in colour—just the type, in fact, that find favour with exhibitors, and those fruits I tasted were very good in quality. It is a very strong grower.

SPINACH BEET.—Not only are the leaves of this an excellent substitute for Spinach during the winter months, but it also proves of great value during a dry season like the present. Summer Spinach is simply nowhere, but the Spinach Beet affords abundance of thinnings, and we can also venture to pick the lower leaves of the reserved plants, so luxuriantly do they grow. It is scarcely so good in quality as the ordinary Spinach, but good cooks can make it very nearly like it, and at any rate it is preferable to the New Zealand Spinach."

The following reply was given to a correspondent last year relative to his GRAPES NOT SETTING AND STONING. "The bunch you have sent indicates a deficiency of pollen at the time the Vines were flowering. Shaking the Vines, tapping the bunches, and lightly drawing the hand over them, or shaking the pollen on them from other bunches in which it is plentiful, will assist the fertilisation and consequently stoning of the fruit. Judging by the leaf sent, the Vine appears very healthy, and as the other varieties stone well the failure is not attributable to the deficiency of lime in the border, but is a case of defective fertilisation." Our correspondent now writes:—"Many thanks for your information on the Mill Hill Hamburg Grapes I sent you last year (page 181, August 21st). I have carried out your instructions, and I am thankful to say I have no stoneless berries this year, only one bunch that I left to see the result of fertilisation." This experience may possibly be useful to others who find a difficulty in setting full bunches of Grapes.

THE WESTON-SUPER-MARE AND EAST SOMERSET HORTICULTURAL SOCIETY will hold their thirteenth annual Exhibition on Tuesday, August 18th, in the Grove and Rectory Field, Weston-super-Mare. The schedule enumerates 122 classes, in several of the more important of which the prizes are very liberal. For instance, four prizes of fifteen, ten, five, and three guineas each, are offered for twelve stove and greenhouse plants, several others of proportionate amounts being offered in smaller classes.

At the monthly meeting of the BELGIAN SYNDICATE OF HORTICULTURISTS AT GHENT, on the 11th inst., the following members being present:—MM. A. Peeters, A. de Craen, L. de Smet, Ch. Spae, Em. Vervaeet, Fr. Debois, Em. de Cock, A. Roseels, V. Cuvelier, and Romain de Smet—certificates were awarded for the undermentioned plants:—To MM. Vervaeet et Cie for *Dendrochilum filiforme*; to M. James Bray for *Cattleya Dowiana* and *Cypripedium Stonei*; to M. A. D'Haene for *Pandanus D'Hanei*; and to M. A. Peeters for *Cypripedium Morganiae*. Several cultural certificates were also accorded to the Compagnie Continentale d'Horticulture and others.

MR. HUGH HENDERSON sends a short note on the SPLITTING OF GRAPES, in which he says "A Thinker" shirks all his questions," and observes—"It would be difficult to mention any natural law so universally acknowledged among gardeners as the one in question, and it would be as well if our correspondent would bring some facts to prove what he so persistently asserts, that moisture passing through the skins causes Grapes to burst, and that temperature is no agent in the operation." Perhaps sufficient has been said on this subject at present, though we consider it well worthy of the deep consideration of persons who have experienced difficulty in preventing the rupturing of the skins of certain varieties of Grapes. The action of osmosis is not dependent on temperature.

MR. JOSEPH MALLENDER sends the following summary of METEOROLOGICAL OBSERVATIONS at Hodsock Priory Worksop, Notts, for July:—Mean temperature of month, 60.1; maximum on the 25th, 86.0; maximum on the 29th, 40.0; maximum in the sun on the 26th, 133.7; minimum on the grass on the 29th, 32.7; extreme range, 46.0. Warmest day the 20th, coldest day the 29th; mean temperature of air at 9 A.M., 62.5; mean temperature of soil 1 foot deep, 61.1; total duration of sunshine in month, 166 hours, or 33 per cent. of possible duration. We had one sunless day. Total rainfall, 0.32 inch. Rain fell on five days. Average

velocity of wind 65 miles an hour; it did not exceed 400 miles on any day, and fell short of 100 miles on three days. It was the driest month of any during the last ten years except January, 1880. Temperature about the average, and very similar to last year. Sunshine rather more than last three years, but less than in 1881. Rain very much needed at the end of the month.

— GARDENING APPOINTMENT.—Mr. S. Lyon, recently gardener at Sundridge Park, Bromley, Kent, has been appointed gardener to Viscount Bridport, Cricket St. Thomas, Chard, Somerset.

— TRACHELIUM CŒRULEUM (BLUE THROATWORT).—A correspondent writes:—"This attractive perennial from the Mediterranean region belongs to the Campanula family. It is a sub-shrubby branching plant, from 18 inches to 30 inches high, producing in summer large clusters of pale blue flowers. It is not only a very attractive border plant, but it is also one that deserves to be grown in pots. Thus grown it will compare favourably with *Statice profusa*, which plant it resembles in habit of growth, form, and colour of flowers, either set up in a miscellaneous collection of plants in the exhibition tent or for greenhouse and conservatory decoration. Mr. Molyneux of Swanmore Park, Bishop's Waltham, who staged a well-grown plant of it in his first-prize collection at the late Southampton Show, which was very much admired, finds it very useful and easily grown for the purposes indicated above. It is also a very suitable plant for vases. It is easily propagated by seed, cuttings, or division of the roots; the latter is the best and certainly the quickest way of working up a stock of it, potting the divisions in spring in suitable sized and properly drained pots, in three parts light loam and one of leaf mould, with sufficient sharp sand added to render the whole somewhat porous, and be afterwards grown on in a cold pit or frame like *Spiræas* or such like plants."

— MR. JOHN T. CAMPBELL relates in the "American Naturalist" his discovery of one of the causes of the phenomenon of PARTICULAR TRACTS OF LAND BEING COVERED WITH A SIMULTANEOUS, NEARLY EXCLUSIVE, GROWTH OF TREES OF A PARTICULAR SPECIES. Some have ascribed the phenomenon to a peculiar fitness of the soil to particular kinds of vegetation which he does not find to exist. His explanation is very simple, and is to the effect that the matter lies wholly or mainly in the fact of the ground being in a fit condition to receive the seeds of the various species when they fall upon it. Seeds of different kinds fall at various seasons, and when the ground is in various conditions as to moisture, &c. Those that find the ground in good condition sprout and grow if no accident occurs to remove the plants when very young. Mr. Campbell has tested this view in his surveys in the occasionally flooded bottom-lands of the Wabash River, and illustrates it by following the futures of the seeds of three species of trees. The balls of the Sycamore or Buttonwood begin falling early in the spring months, and if a flood is receding at the time they stick to the soft moist banks wherever they touch them, and particularly along the highest parts of the sand bars. Were it not for the subsequent floods in the same spring no other trees could grow, for these would occupy the ground. But they are easily killed during their infancy by overflows, and this is what happens to most of them. The Cottonwood is the next in order of shedding seed, and if another flood is receding while this is taking place it will have killed all the Sycamores which it has covered, and sprout the Cottonwoods. These in turn may be killed by the next floods. It is the turn of the Maples next to shed their seed and try for the ground. If either of these species succeed in making wood without a flood it will hold the ground, and its rivals will not be able to get a place. Last spring the edges of the successive plantations escaped the next floods after the seeds fell upon them, and Mr. Campbell could see along the river banks three belts of young trees, and distinguish them by their general appearance. The upper belt was of Sycamore, the second (downward) of Cottonwood, and the third of soft Maple. In June a bigger flood came than any that caused the seeds to sprout, and killed all the young trees.—(*American Cultivator*.)

A VISIT TO BARON SCHRÖDER'S GARDEN.

AND this was how it came about. The Horticultural Club had been arranging about its annual outing, and knowing how well its members had been cared for at Slough it was determined to make that again the starting point. The Royal Gardens were talked about, and our President, Mr. John Lee, suggested Baron Schröder's as well, but when we came to think over it we considered, as there were ladies with us, that enough was as good as a feast, that we should find as much at The Dell as would satisfy a very hungry horticulturist, and so we determined on it. It was

on a perfect day—last Thursday—that we met a somewhat less number than usual, for the great heat rather frightened some; and it was, moreover, a great disappointment to us that our "guide, philosopher, and friend," Mr. Harry Turner, was prevented by business from accompanying us. Before starting on our drive through Windsor Park to Baron Schröder's we visited the Royal Nursery at Slough, and enjoyed such a treat as is nowhere else to be had, seeing Mr. Turner's magnificent collection of Carnations and Picotees. House after house was filled with grand specimens in pots; out of doors immense collections in pots also were to be seen, while beds after beds of seedlings of the tree or fancy type were in full flower. Some idea of the magnitude of this collection may be gathered from one piece of statistics alone. In the month of October, when the layers are placed in small pots to winter in, there were 210 frames, each 6 feet by 4, filled with them. Of course all the very best kinds are here grown in quantity, and the grass was in fine condition, having that glaucous look so much desired by growers of this beautiful class. In a rapid survey of the houses the following were noted as being especially fine:—*Scarlet Bizarres*.—Arthur Medhurst, Charles Turner, Fred, George Rudd, John Buxton, Mars, Rayner Johnson, and Robert Lord. *Crimson Bizarres*.—Albert, Chancellor, E. S. Dodwell, H. L. Mayor, J. D. Hextall, John Simonite, and Sultan. *Pink and Purple Bizarres*.—James Taylor, Sarah Payne, and Unexpected. *Purple Flakes*.—Dr. Forster, James Douglas, Mayor of Nottingham, and Squire Meynell. *Scarlet Flakes*.—Annihilator, Flirt, John Ball, Jupiter, Matador. *Rose Flakes*.—Rob Roy, Jessica, Tim Bobbin, and Samuel Norman. *Picotees*.—*Red-edged*.—Dr. Epps, Emily, Grosteen, Horace Major, Mrs. Bower, Queen of Summer, Violet Douglas. *Purple-edged*.—Baroness Burdett Coutts, Clara Penson, Her Majesty, Mary, Mrs. A. Chancellor, Rev. J. B. M. Camm, and Zerlina. *Rose and Scarlet-edged*.—Constance Heron, Fanny Helen, Louisa, Mrs. Payne, Edith Dombrain, and Royal Visit. The yellow Picotees were also very beautiful.

Having taken a good view of these, over which we could have lingered for a much longer time, we re-entered the brakes and drove through the Great Park. We had intended to have visited the Royal Gardens, but we found that this would occupy too much time, and so we made at once for The Dell, where we were met by Baron Schröder's excellent gardener, Mr. Ballantyne, and were conducted to the house, which is most charmingly situated on the skirts of Windsor Forest. From the dining-room window and the terrace there is a most exquisite view of Windsor Castle; you look down through a vista of noble trees over the Dell, from whence the house derives its name, and there in the distance stands out the noble pile of the Castle glittering in the bright sun, and justifying its claim to be one of the grandest, if not the grandest, of all the palatial residences of European sovereigns. Mr. Ballantyne kindly took us into the forest, where from a point of view opposite Miss Seymour's residence, there is if possible a more lovely view, but both scenes will long remain in our memory.

The house is not a large one, but has been built and added to with a good eye to comfort. There is at the garden side of it a long glass verandah, which when filled with flowers must be excessively pretty. At the north side of the house there is a very beautiful fernery, containing many choice specimens of Tree and other Ferns. The grounds are laid out with very great taste, trees judiciously planted, bright vistas through them, and Conifers seem to do remarkably well there. One of our members is a gentleman who is an expert in such matters, and he said that whoever laid it out was an artist, and that he had rarely seen a place more beautifully arranged. There is on the lawn a parterre of light bedding out, but at this time sadly wanting moisture, while all around are choice trees and flowering shrubs of all kinds, including perhaps one of the choicest collections of Rhododendrons in the country, the older varieties having been gradually weeded out and their place taken by all the best seedlings of Waterer and others. The high road to Egham passes close by the grounds, and the garden proper being on the other side, a subway has been made under the road, so that you pass from the pleasure ground to the garden without leaving the place. It is in this garden that the grand collection of Baron Schröder, especially of Orchids, is to be found. There is also a goodly range of vineries, in which there was a magnificent crop of Grapes. One house of Black Hamburgs had been cleared in the Ascot week, but there were houses full of well-developed, beautifully coloured bunches, also Muscat of Alexandria, Foster's Seedling, Madresfield Court, and other good varieties. There were also Peach houses with even crops of luscious fruit, all bearing witness to the intelligence and skill of Mr. Ballantyne.

It is known to everybody that Baron Schröder possesses one of the choicest and most select collections of Orchids in the country, vieing with Sir Trevor Lawrence and Mr. Lee, but July is a bad month to see Orchids in flower. There were, however, some *Cattleyas*, *Vandas*, *Cypripediums*, and especially that beautiful variety of *niveum* which obtained a first-class certificate lately. The whole collection showed that the plants were most carefully looked after, and rewarded their care by great luxuriance and health. In another house there was a beautiful collection of Zonal *Pelargoniums*, Tuberous rooted *Begonias* of the very best kinds, and also a large number of the deliciously sweet-scented *Tuberose* finer than I have seen them for some time, but the plant which struck me as most remarkable was the very finest example of *Alocasia Veitchii* that I have ever seen. The leaves were at least 3 feet long, and perhaps more, the plant about 4 feet through, and the leaves fall down all round in the most perfect manner. I have often seen specimen plants at our great exhibitions, but never one comparable to this. *Allamandas* and other stove plants were luxuriantly in flower, but we had not time to linger over these, nor to visit the Pine pits, where some splendid fruits are produced; in fact we all felt that our whole day might have been very profitably occupied in

this beautiful and interesting spot. I should say that through the kindness of the Baron we were permitted to see the small but choice gallery of pictures of the modern schools. There are some beautiful examples of Jerome, Paul Delaroche, Meissonier, Alma Tadema, &c., and a wonderful, perhaps unique, collection of signet rings.

After spending a couple of hours here we again started for Virginia Water, and thence on to Ascot, where, at the Royal Hotel, dinner had been arranged for us. It is an old saying, "Good wine needs no bush," and so I suppose this hotel stands in no need of commendation; but in cleanliness, in attention to the wants of visitors, and in moderate charges, I do not think it is to be excelled, and anyone who delights in beautiful English scenery might do worse than sojourn here for a while. We left Ascot at seven, and arrived at Slough in time for the 8.37 train to Paddington, and have again to score a decided success in our club outing, and which has each year afforded those who took part in it so much pleasure.—D., Deal.

THE ORCHIDACEOUS PLANTS OF HEREFORDSHIRE.

[Read at the Woolhope Naturalists' Field Club by C. G. Martin, Esq., President.]

REMARKABLE as our county is for many natural products, it cannot be said that the Orchidaceæ, particularly the rarer species, are so abundant as they are in some other counties in England. It is a defect which need not be regretted, except perhaps by an enthusiastic botanist. A very slight consideration will show that it may be regarded not only with equanimity, but with cheerful resignation. Orchids are seldom found upon the best soils. Where they abound the land is almost certain to be of an inferior quality, or indifferently cultivated. On poor, hungry, water-logged pastures, in wet woods and bogs, or upon thin chalky downs or bare limestone ranges, the Orchids will be generally found growing most plentifully and luxuriantly. The construction of a large proportion of them would lead us to expect this. Plants which have thick, fleshy, bulbous roots and succulent stems require excessive moisture; a large proportion of the Orchidaceous group are of such a nature. Instances are known of pastures that once abounded with Orchids which have altogether disappeared, as the result of thorough drainage and better cultivation. We have no bogs in Herefordshire. We have not a wide extent of comparatively useless moorland. We have no chalk downs. Our limestone ranges are too argillaceous, and too poor in carbonate of lime, to satisfy the fastidious requirements of the higher classes of Orchids. In the British Flora the Orchidaceæ comprise sixteen genera and thirty-nine species. In our county we have nine genera and twenty-one species, with possibly four varieties, which are disputable. Some of these are very rare; but, so far as I know, many of the most refined, the most highly specialised of the Orchids, have never been found in Herefordshire. My own knowledge of the county is very much limited to the district immediately around our city, but I am greatly indebted to the Rev. Augustin Ley for much generous and helpful information as to the habitats of Orchids in other localities, to which I have never had access. Of the twenty-one species recorded for the whole county I have found fifteen in our own neighbourhood.

I will not weary with any scientific description or technical details of the Orchid family which can be found in any "Handbook of the British Flora." I shall endeavour to give a general outline of each plant, and the locality where it has been found, together with anything of special interest in connection with it.

1, *Epipactis latifolia*, or Broad-leaved Helleborine, is common in woods and shady places, and blossoms between July and September. The flowers vary somewhat in colour from purplish-green to deep purple. I have found them in Acornbury Woods, Haugh Wood, and Rotherwas Woods. Mr. Ley reports them from every district into which our county has been divided. There is a very curious feature connected with this flower which deserves recognition. Sir John Lubbock says, "This flower has special attractions for wasps;" and he quotes Darwin as saying that, "If wasps were to become extinct in any district so would *E. latifolia*."

[Var. *E. media*, or Intermediate Helleborine. Var. *E. ovalis*. Var. *E. purpurata*. Babington considers these varieties the same as *E. latifolia*, the differences being so trifling as not worthy of being classed as separate species.]

2, *Epipactis palustris*, or Marsh Helleborine.—This is a beautiful flower. The florets are few, whitish, tinged with crimson, somewhat drooping, and they grow in a lax spike. It is rare, flowers in July and August, and grows in wet meadows and marshes. In our county it has been found at Ridgway Cross, Cradley. Lees, in his "Botany of Malvern," says "it is plentiful at Tedstone, on the banks of the Sapey brook." It has also been gathered on the rough moors, Mansel Gamage, at Burghope, and on the Moseley Common, Pembridge.

3, *Cephalanthera grandiflora*, or Large White Helleborine, is a rare and handsome plant. The flowers grow in a distant spike, and appear during May and June. They are of large size, sometimes as pure as snow, sometimes greenish-white, but more frequently delicately cream coloured, with a small yellow lip marked with raised lines. The leaves are broad and bright green. Until recently it was reported from only two localities in Herefordshire, Huntsham Wood, and Lord's Wood, on the Great Dward. But at our last field meeting Dr. Wood of Tarrington brought some fine specimens which he found in the parish of Canon Frome.

4, *Cephalanthera ensifolia*, or Narrow-leaved white Helleborine. This is a rare plant of mountainous woods on limestone. The Rev. Frank Merewether brought me three or four plants in 1865, to ask me its name. The next day, by arrangement with him, I went to Woolhope, and he took me to the spot in Haugh Wood where he found it. Every year since, about the end of May or the beginning of June, I have gone to the same place and found it growing pretty plentifully. The only other place in Herefordshire where it has been gathered is Huntsham Wood. (Miss Lewis of Ludlow, informs me to-day she has found it at Bringe Wood, near Ludlow, within the county of Hereford). It is a very elegant plant, blossoms somewhat spiked, white, the lip with slightly elevated lines on the disk, and a yellow spot in front.

5, *Listera ovata*, or the common Twayblade.—This, though inconspicuous,

is one of the commonest of our Orchidaceous plants (specimens produced). It is readily distinguished by its two broad, glossy, ovate leaves, sometimes from 3 to 4 inches long, about half way up the stem. It varies in height, according to the locality where it grows, from 6 to 18 inches. The flowers are green, and they form a long loose spike, quite unattractive in appearance. But though it has so modest a bearing, there are few of our Orchids that are more interesting, and none of them show more contrivance and design in their structure. Hooker, Darwin, Sprengel, Sir John Lubbock, Dr. Müller, and others have spent hours at a time in watching its mechanism, and Darwin devotes no less than thirteen pages ("Fertilisation of Orchids by Insects," pp. 139-152) to his description and diagrams of it, and remarks upon it. It has great attractions for insects.

6, *Neottia nidus-avis*, or Bird's Nest Orchis.—This most remarkable plant, in appearance more like one of the Orobanches, has its stem, leaves (or rather scales), and flowers all of a dingy-brown hue. It is rather rare, but it is well represented in Herefordshire. It is said to have received its old name of "Bird's Nest" from its peculiar root, which consists of very numerous tufted, cylindrical, fleshy fibres, and are supposed to remind one of the sticks used by some birds in the construction of their nests. This Orchis has been found in every district in our county. The members of the Club gathered them abundantly at our last field meeting in Acornbury Woods, on the 18th of last month. They have been unusually abundant this year in other counties as well as our own.

7, *Epipogium aphyllum*, the yellow-flowered Leafless Orchis.—This might almost be called the Herefordshire Orchis. It is fully described by Mr. Edwin Lees in his "Botany of Malvern." His description is from a specimen sent to him by the Rev. Gregory Smith, and was gathered in a copse called "The Paradise," close to Sapey Brook, at Tedstone Delamere, in 1854. It was discovered and gathered by Mrs. Anderton Smith. It was dug up and placed in the Rectory garden. No other specimen has been since discovered, though carefully sought for. It has been found twice in a wood near Ludlow by Miss Lloyd in 1876, and by Miss Peel in 1878. It is, without doubt, an extremely rare plant. It is known on the Continent, but even there it is most rare. Miss Lewis, of Ludlow, says that she saw the plant found in 1876 and 1878. There were three or four distant florets on the stem, similar to the Bee Orchis, but they were filmy and semi-transparent in appearance. As it has been twice found within the last decade on the borders, if not within our county, we may hope that it will be seen amongst us again; and if it should be I venture to express the hope that it may be permitted to grow and seed, and have every chance of reproduction.

8, *Spiranthes autumnalis*, or Lady's Tresses, is a somewhat rare plant, but may be found in certain districts of our county, about the end of August and during September. It is reported from Lyston, Orcop, and St. Weonards, from Coughton Marsh and Coppet Wood Hill, also between Hoarwithy and Carey. Mr. Ley found it at Hole-in-the-Wall, Mrs. Armitage at Dadnor, and it has been gathered in Gorstley Quarries. In central Herefordshire it is known to grow on the south side of Bishopstone Hill, and the Rev. R. H. Williams says that it grows plentifully at Byford. Mr. Crouch reports it from his district in the north-west; Mr. Lingwood from Llanthony; and I found it at Cublington in the parish of Madley. The flowers are white, with a sweet, though not powerful, scent of almonds. They are spirally arranged, the florets all pointing one way, sometimes from right to left, sometimes from left to right. It is an especial favourite with bumble bees. They begin with the lowest floret on the stem, and climb to the top, extracting the nectar from each, "in the same manner as a woodpecker climbs up the bark of a tree in search of insects."—(Darwin).

9, *Orchis mascula*, or early purple Orchis, the "Cuckoo Flowers" of our childhood and the "long purples" of Shakespeare is probably the commonest of our native Orchises. It is a beautiful plant with spotted leaves and richly dyed petals, and is well known as the earliest of the class. I have often found it in March, and in April it is pretty general on indifferent pastures, in wet woods, in shady lanes, and even on the roadside. Bishop Mant wrote of it—

"In that broad field of springing grass,
First of his lip and horned class,
The early-flowering Orchis show'd
His smooth and spotted leaves, and glow'd
With spiky stalk elate, and head
Of spiral blossoms, purple red."

It is generally admitted that the *O. mascula* is the flower referred to by Shakespeare in Hamlet, Act iv., Scene 7, at the meeting of the Queen and Laertes, when she tells him of the death of Ophelia:—

QUEEN.—Your sister's drowned, Laertes!

LAERTES.—Drowned! O, where?

QUEEN.—There is a willow grows aslant the brook,
That shows his hoar leaves in the glassy stream.
There, with fantastic garlands did she come,
Of Crow-flowers, Nettles, Daisies, and Long Purples,
That liberal shepherds give a grosser name,
But our cold maids do Dead Men's Fingers call them.

The name which Shakespeare delicately hints at, and the other name which he cites, have both been preserved in old Herbals. They are unquestionably Orchids. They could not apply to any other class in the floral world. The identity of the "Long Purples" with the Orchis family has thus been fixed by Shakespeare himself.* He did not write with the precision of a botanist, but with the freedom of a poet. It is probable that he did not know the scientific distinction between one species and another. He looked upon flowers as "charming factors in the general loveliness of nature," and he did not hesitate to use their common well-known popular names. "Dead Men's Fingers" was the vulgar name applied to *O. maculata*, *O. latifolia*, and *Gymnadenia conopsea*, because of their peculiarly shaped, pale, palmate tubers (specimens shown), which are supposed to bear certain resemblances to the human hand. There is a touching old ballad that tells of the sorrows of a maiden who had lost her lover by death, and this name, with a slight variation, occurs in one of the stanzas:—

"Then round the meadows did she walke,
Catching each flower by the stalke,
Such as within the meadows grew,
As Dead Man's Thumb and Harebell blew;
And as she pluckt them, still cried she,
Alas! there's none e'er loved like me."—(Roxburghe Ballads.)

* Warburton, who wrote about a century ago, says "Long Purples" is the vulgar appellation for a beautiful species of wild flowers. Their botanical name is Orchis.

10, *Orchis morio*, Green-winged Meadow Orchis.—In our county this is perhaps almost as universal and common as the preceding. It used to be called the "Fool's Orchis" in my boyhood, because heedless and unobservant people were supposed not to discriminate between it and *O. mascula*. The flowers form a loose spike, and may be readily distinguished by their sepals, which, whatever the colour of the florets, are marked with green veins, and curved upwards so as to form a kind of helmet over the rest of the blossom. I have gathered them in damp meadows near to Hereford of every shade of colour, from white to deep purple, and sometimes richly variegated.

11, *Orchis maculata*, or Spotted Palmate Orchis, is as common as both the foregoing. It is a very elegant plant. The flowers are a delicate lilac, and sometimes almost white. They are spotted more or less with purple. So also are their leaves. They grow abundantly in our woods, lanes, and pastures.

12, *Orchis ustulata*, Dwarf Dark-winged Orchis.—I have gathered this pretty peculiar little plant frequently on the chalk hills of Surrey, but never in Herefordshire. It is not unknown in our county, though, unquestionably, it is very rare. Mr. Lingwood found one specimen in 1859 in the meadows by the Wye at the foot of Coppet Wood Hill, and he also found it in one other locality. It has been reported to be growing "in plenty" in a meadow near Colwall, and Mr. Lees received some specimens in 1868 from limestone slopes at Mathon.

13, *Orchis latifolia*, or Broad-leaved Marsh Orchis, is more widely distributed, but is not common. It is described as a tall and somewhat slender plant, the flowers usually deeper coloured and less variegated than *O. maculata*, with a hollow stem, and leaves remarkably erect and pointed. Mr. Lingwood found it at Orcop. Mr. Purchas in a damp meadow near the Castle Brook, Bill Mill. Mr. Ley at Ashe, at Hoarwithy, at Sollershope, and at Eaton Bishop. It has been reported from Bosbury, Egleton, and Widemarsh, Hereford.

Var. Orchis incarnata, is very rare. Bentham does not note this as a separate species. Mr. Ley found it growing "in some plenty, in June, 1880, in a marsh at Pont-y-Spig.

Orchis pyramidalis, or Pyramidal Orchis, is one of the most beautiful of the class. Its dense, compact pyramid of exquisite blossoms of a rich deep pink or crimson purple are unmistakable. It is not common in our county. It has been found at Marcle Hill and at Mordiford. Mr. Purchas, Mr. Ley, and Dr. Bull have gathered it at Fownhope. Mr. Ley reports it from Oldbury Hill. It has been gathered at Cradley, at Whitbourne, at Castle Frome, and the Mill Copse, Cowligh Park. I found it growing plentifully last year on the Ridgeway, Eastnor Park. Specimens have been gathered in a quarry near Kimbolton, and on the roadside near Berrington Tunnel. It is said to have been found in the western districts of our county, but the only locality given is Bredwardine Hill. At our last field meeting at Aconbury Camp Dr. Wood brought some plants which he found at Canon Frome. Our veteran member, Mr. Edw. Lees, poetically observes, "When in July the elegant marbled butterfly is fluttering about these beautiful Orchids the picture is very exciting to a lover of Nature's harmonies." Professor Darwin has written perhaps more enthusiastically of this Orchis than of any other. He says it is "one of the most organised species which I have examined." After a very minute description of its several parts he continues, "In no other plant, nor indeed in hardly any animal, can adaptations of one part to another, and of the whole to other organised beings widely remote in the scale of nature, be named more perfect than those presented by this Orchis. As the flowers are visited both by day and night-flying Lepidoptera, I do not think that it is fanciful to believe that the bright purple tint (whether or not specially developed for this purpose), attracts the day fliers, and the strong foxy odour the night fliers." One feels while reading his remarks about *O. pyramidalis* that he is describing a complicated, delicate, and exquisite piece of machinery rather than an English wild flower, commonly in many districts regarded as a wayside weed. Douglas Allport has written some pleasing verses upon this lovely flower, only one stanza of which I will quote:—

"Thus, when within my sunless room,
Heartsick and worn with Mammon's leaven,
Thy pyramids of purple bloom
Blush through its loneliness and gloom,
The spirit bursts its living tomb,
And basks beneath the open heaven."

(To be continued.)

NOTES FROM TASMANIA.

THE enclosed letter, giving an account of a voyage out to and first impressions of Tasmania, may be interesting to those who have to stay at home. It is from a constant reader of your paper, and as she is a great gardener and intends residing there for some years, her notes may be interesting. If you would care to have them kindly say so through the paper. I may remind you that June in Tasmania is about equal to our November.—D. G.

"Hobart, Monday, June 1st.—I have just begun to feel that I am safe on land once more now, and therefore it is possible to me to write some sort of a letter, even if only a dull one. The Tropics are not to be forgotten. I never knew what a terrible thing heat was before; it is so altogether different from your heat—such a feverish affair, I felt all the time as if I were exhausted with some dead-lift effort. There was none of the usual languor of heat till it got cooler. We are enjoying Hobart very much. Our chief joy is the garden of the Royal Society down by the river, in the Domain. I never saw anything like the evergreens. It seems almost unnatural to see something like a Holly, for instance, with a good-sized yellow flower, having a delicious scent; then another lovely one, with a blue flower something like your Plumbago in colour, with the shape of a Bluebell; then the most splendid crimson *Tasconias*, otherwise Passion Flowers. Even at this dead season there are endless things to see. In summer it must be a paradise. There is a nice old Irish gardener here who seems very obliging, and he says there is no fault to be found with the garden, only that there is not enough water. Soil and

climate are perfect; everything they get grows, whatever part of the world it comes from. They do not seem to have at all a good collection of Roses, very few indeed, I think, and not mulched or anything. There is a large bush of Madame Willermoz, and I think Mrs. Bosanquet, but it is too late to say. They have very good Chrysanthemums, all outside; but the Dahlias are over. I do not think they have any singles; do not forget to send me some seed.

"We get confused with the seasons being so different. I feel a constant desire to call it December instead of June. The weather is delightful in the mornings—warm, dry, and sunny; but it generally rains a little in the afternoons. It was new to me to see large bushes of Heliotrope in the garden, and to hear that it was never killed by frost, unless put in a very bleak place indeed. Certainly we ought to have a grand garden here. There are fine crops of Oranges and Lemons, so we must have those too.

"The garden we went to at Port Said was a curiosity. We never regret having gone there, it was so very different from any other garden. There were some extraordinary flowering trees of unknown kinds. An Hibiscus was covered with big red Poppy-like flowers, only instead of being flimsy they were, as the catalogues say, 'flowers of great substance and endurance.' They were everywhere down the Canal where there was a house of any kind. Did you notice what splendid foliage there was wherever there was any at all in the desert? I thought it was very remarkable. At the Port Said garden they watered every day, but it looked all parched. There was some poor dried-up Mignonette and Pansies, and some sickly-looking Gladioli. On the other hand there was an immense tree of Lantana. They had some La France Roses, they were a lovely colour, and I think rather less flimsy than yours, but not very large. The foliage of the Roses looked very bad. On the whole it was gardening under difficulties there, although the little bits of plants we see in hothouses appeared there as big as Birches and Hawthorns.

"The people brought splendid bunches of Maréchal Neil and other Teas on board at Naples, and even at Aden I saw men with Maréchal Neil in their buttonholes. How anyone grew them there heaven knows! Fruit and vegetables are splendid here, but those, they say, are grown by the Heathen Chinee, so I am afraid the Tasmanian is a lazy gardener, for I see scarcely a flower about—a Chrysanthemum or two, and some common Geraniums. Some people here say the Oranges and Lemons at the garden are not worth anything. They get them all from Sydney. I am sorry for that, it would be a pleasing novelty to grow them. We get delicious Pears for 2s. per dozen, smaller 1s. 6d., Winter Nelis the name, well-known to me; so it appears they grow the same varieties as at home."

[We are obliged by this letter, and further notes so interestingly written will be welcome to us and acceptable to our readers.]

CLIMBERS FOR WARM CONSERVATORIES.

A WARM conservatory has the lowest average nightly temperature in winter, ranging from 45° to 50°. Even in severe weather it should seldom fall below 40°. On the other hand, a cool house, where preservation is the chief object, may range from 10° to 5° lower when the weather is severe. In fine mild weather in winter the warm conservatory may average 50° at night. In severe frost it will be safe at from 40° to 45°. In all cases where sun can be had the house may be allowed to rise from 5° to 15° by the heat of its rays, and be early shut up. In fact, air should be given in winter chiefly to keep the atmosphere sweet and prevent the plants getting drawn.

Plant in April or May, as then the plants have got the whole season before them to grow freely, and as, unless the plants were very large, much bloom could not be expected the first year. If planted out, the position, if possible, should be near the heating medium, whether pipes or flues, as this will keep the roots more comfortable. It will also be advisable to make a small pit, say 2 feet square, with bricks, &c., for each plant, and deep enough to allow plenty of rough matter at the bottom communicating with a drain. The separate pit for each will not only tend to prevent rampant unripened growth, but it will be easy to remove a plant without disturbing its neighbour. If not planted out wooden boxes will be preferable to any kind of pots, as the roots will be less exposed to variations of temperature. The soil, in general cases, should be light and open, as luxuriance can always be obtained by surface dressings and supplies of liquid manure.—S. T.

EARLY PEACHES.

I AM glad Mr. Rivers has given his opinion of these, as anything he says on the subject must carry much weight. I am pleased to know of a Peach which will ripen four weeks earlier than Hale's Early, and I will introduce the Alexander this autumn. I have no intention, however, of throwing away Hale's to make room for the Alexander. It has proved itself too trustworthy both under glass and in the open for me to think of that; but if the Alexander prove a good predecessor it will be highly esteemed. Peaches which ripen towards the end of August and during September are common enough, but, like early Peas, the earliest of the early will find innumerable patrons, and varieties which will ripen in an unheated house any time in June cannot be too widely known or generally planted. The climate here is not excessively forcing. It is mild, certainly, but often sunless, and in my opinion Hale's is constitutionally early apart from any influence of climate. I think were the dates on which different fruits ripen throughout the country noted and published in your columns, they would furnish much interesting information for many of

your readers. Shipley Apricot was ripe in the open here on August 1st, and Hemskirke is ready to-day, August 8th. Four or five years ago I gathered fine ripe Green Gage and Victoria Plums from the open walls on August 3rd. This year there will be none really ripe until the last week in August or the first week in September.—J. MUIR, *Margam, South Wales.*

CHOICE ALPINE PLANTS.

SOLDANELLAS.—These form one of the most charming groups among the dwarfed alpine. Too little known and understood probably are some of the reasons for now and again meeting with them starved in small pots with moss-covered soil, bearing sure evidence of the lingering existence. To pass from a few miserable pieces so generally seen to a fine carpet of either of the species when in full flower, would illustrate in the best possible manner the real beauty of these lovely little alpine. They are by no means difficult to grow, but, on the other hand, are of comparatively easy culture, the one great point insuring success being abundant moisture. In dry shallow soils they soon become unhappy, and growth will be anything but luxuriant, but they may be planted with perfect safety in the full sun provided they are in a deep bed of soil of peat and loam, which must be continuously moist. It will not be difficult where rockeries exist to find a suitable position for them, or they will soon be content in the artificial bog, in which place care must be taken that they do not get over-run by Lichens. I have said that under certain conditions they are quite safe in the full sun, and on the other hand they do well in moist shady positions, but wherever they are placed moisture must be forthcoming to do them justice or have them in perfection.

Soldanellas seldom find their way to the exhibition tent, so that there would appear abundance of room for improvement in their culture, and a few well-flowered examples at any of our spring shows would be sure to meet with many admirers, seeing that they are almost, if not quite, unique in appearance. The two species most generally seen, at least where they are to be seen at all, are *S. alpina* and *S. montana*. The first-named forms a dwarf compact carpet of roundish, leathery, and somewhat shining leaves, and from these issue the flower stems, which usually attain to about 6 inches high, terminating with pendant, pale blue, somewhat bell-shaped flowers, usually about four on each stem. The flowers, which are cut into numerous narrow segments, have a most pleasing appearance when seen in anything like specimen form, which, unfortunately, is not an everyday occurrence. *S. montana* is very similar to *S. alpina*, and hardly distinct enough probably to be regarded as species, the only difference being, so far as my own observation goes, is that *montana* is larger in all its parts, of more robust habit, somewhat taller, growing to 9 inches high when established, and the flowers a little bolder. *S. pusilla* is of smaller habit of growth, with reniform leaves, while the corolla is not so deeply divided as in the case of the two first-named. Then we have the exceedingly small *S. minima*, a still rare plant of very slow growth. I have never seen a healthy patch of this, nor have I grown one to my satisfaction; the scraps one gets from importation requiring, as a rule, much care and patience to establish. A position on the rockery in the shade and near the eye is suitable for these plants, and after planting in equal parts of peat and loam, with a good addition of sharp sand, place some stones on the surface to prevent a too rapid evaporation. On many of the great mountain chains of Europe these grow somewhat plentifully, and it is to be regretted that they do not reach us in finer tufts than they do, as by making a start with good sized plants instead of the microscopic scraps one usually receives of these from hardy-plant nurseries, the after attention is comparatively easy. If memory serves me right I believe Mr. Lynch of the Botanic Gardens, Cambridge, grows the Soldanellas in company with hardy *Sarracenia*s, *Parnassia*s, *Goodyera*s, *Drosera*s, and moist-loving native *Orchis*es in peat in a narrow border at the foot of the rootery in the bog garden, and which may be saturated at will.

PRIMULA OBSCURA.—Without exception this is the most floriferous of all the *Primulas*, flowering continuously for months in succession; not merely in one or two, sufficient to prove that the plant has a flower upon it, but in one unbroken mass of flower spikes, which are continually produced, and develop their pleasing flowers with truly remarkable freedom, and of which the following will serve as an illustration. I was calling on a friend in the neighbourhood of Bath in the early part of the present year, when I was somewhat surprised to find a fine specimen in full flower in an 8-inch pot in the cool conservatory. I was informed that the plant had been flowering for some weeks, was most useful for vase-decoration on account of its lasting qualities and light graceful spikes associating so well with other flowers.

Some three weeks since my friend wrote me saying that the *Primula* I so much admired had been flowering continuously ever since my visit (when I believe it had some twenty-seven or thirty spikes of bloom) but that the gardener had that day cut off all the flower spikes for fear the plant might become exhausted. Thus, after a period of six months flowering, compulsory means had to be resorted to so as to promote new growth and be ready again for winter flowering; so that apart from its value as a hardy plant, it will become invaluable for greenhouse and conservatory decoration, and by adopting special means in its culture it may become a prominent figure among, and likewise a valuable addition to, winter-flowering plants. Where good plants of this pleasing *Primrose* exist, the best means will be to give them a shift into larger pots, using good sandy loam, fairly rich, and keep the flower spikes pinched out till the new roots have taken possession of the fresh soil, after which, if treated as a cool conservatory plant, similarly to the Chinese section of *Primulas*, it will be found to be one of the most useful of recent introductions, and as a perpetual bloomer unique.

ONOSMA TAURICA (Golden Drop).—A choice gem among alpine plants, and one of the most beautiful of the *Borageworts*. It flowers in May and June, and delights in a moist deep loamy soil with perfect drainage. It should be planted so as to allow it to overhang a projecting ledge of rock with plenty of fissure room for the roots to dive into. My principal reason for calling attention to it just now is that the present is a good time for its propagation; not that I would infer that this is the only season in which it may safely be propagated, far from it, as it may be done any time when suitable cuttings are to be obtained, still I point to this midsummer period because cuttings of the right stamp will be more plentiful than they were at flowering time. When of 3 or 4 inches in length strip them off with a heel attached, and insert in very sandy loam in pots, and place them in a cool shady position under handlights and keep them close. I prefer to keep the knife away from these, for it does more harm than good. Such cuttings as I have described will root freely in about three weeks, when the lights may be removed by degrees and ultimately altogether. Its tubular, somewhat ventricose drooping golden flowers in long cymes, render it a favourite whenever seen in good condition, and indeed it is one of the most desirable and attractive of rock plants.

SILENE MARITIMA FL.-PL.—This forms prostrate tufts of glaucous leaves close upon the ground, which, owing to its free and dense growth, soon forms a perfect carpet of its leaves. The flowers are large, pure white and double, somewhat resembling those of a double white *Pink*. It is perfectly hardy, and a continuous bloomer, easily grown and increased by means of cuttings, which should be secured when about 2 inches long. It grows well in ordinary soils, and on account of its prostrate habit it is suitably adapted for the lower portions of the rockery, where it forms a conspicuous plant for a considerable time during the summer months.

PRIMULA MINIMA.—I doubt not that this plant has been somewhat of a puzzle to many growers of choice alpine, and my experience of it is that it requires careful hands and watchful eyes to keep it in good condition. Slugs are particularly fond of this little pigmy, and if they get a good feed, the case, so far as its recovery is concerned, is almost a hopeless one. When in flower it is singularly ornamental, owing to the unusually large rose coloured flowers which spring from its minute rosettes of leaves, and which are nearly an inch across, sometimes hiding the foliage entirely. To grow it well use equal parts of good mellow loam and fibrous peat, to which add some broken brick or mortar rubbish, making the whole compost rather sandy. Give abundance of drainage and plenty of water during spring and summer, and where confined to pot culture let them be firmly potted. If planted out it should be associated with the dwarfiest and choicest of alpine. —J. H. E.

SOIL FOR STRAWBERRIES.

SUCCESS with *Strawberries* in pots depends greatly on the quality of the soil. Really first-rate crowns and splendid fruit are only produced in substantial soil. Manure, no doubt, plays an important part in raising good plants, but nothing, in my opinion, will fully compensate for the want of good soil, and too much attention cannot be given to this. I have grown plants in light soil and they grew freely, but when forcing time came the sandy soil was of little use, and did not produce half the crop or anything like such fine fruits as plants did in very heavy soil. When once established in this they seem independent of manure and develop in a most satisfactory way, both in the case of the plants in autumn and the fruit in spring. As many of your readers will now be potting their spring-fruiting *Strawberries* they will find it of the greatest advantage to secure some very good loam for them, and if this does not

exist on the place a small quantity should be bought for the purpose. Anyone who has been taking stock of the Strawberry crops in different soils this season must have noticed that plants growing in light soil did not produce such handsome fruit as those on stiff land, and the succession was not so long maintained in the former case as the latter. The same rule applies very forcibly to Strawberries in pots.—J. Murr.

ISMENES.

Nothing could be more to the point than to give the name *Ismene* to this section of *Pancratioid* plants. The affinity of these with allied bulbs was so suspicious to the mind of Dr. Herbert at the time he instituted this genus, that he expected, sooner or later, that at least some of the members of the family should be torn asunder and come to a tragic end, just such a work as we are bent upon this very day. The genus is altogether Peruvian; those of them marked as natives of Brazil were only garden plants cultivated in Buenos Ayres; there is no record of one of them being found wild in Brazil. Every one of them, without exception, will do better with the same kind of treatment as the old *Jacobaea Lily* (*Sprekelia formosissima*) than any other way—that is to say, to be planted out in front of a hothouse in April, and to be taken up about the end of October, and kept dry all the winter. *Pedunculatum*, and more especially *Calathinum*, will live out of doors, winter and summer, just like the *Belladonnas*, and flower quite as freely and much earlier; but still, they are much improved by occasional dryings and a change of soil. The great yellow Peruvian Daffodil, *Ismene Amancæ*, does certainly better by being taken up every year. None of them like peat or leaf mould, but they would live in pure sand for a generation if they were well supplied with water during the summer; and it is best to put in a potful of sand, and put each bulb in the middle of the sand at planting time. Another very great peculiarity belonging to them, and to *Choretis* as well, is that their seeds vegetate in ten or fifteen days, but never throw up a leaf the first season; a fang starts away from the seed, like as from the bulb of some kinds of *Oxalis*, and at the end of this fang a bulb will form as large as a wren's egg, without any sign of leaf at all the first season; and that is very likely the reason why these beautiful bulbs are not as common as the *Belladonna*; and the next reason for their being so scarce may be, that their cultivation has not been treated of in popular works, and that most people turned them into the stove, where they soon dwindle and perish.

ISMENE AMANCÆ (The Peruvian Daffodil).—This is the oldest and best known of the genus; a large, clear yellow flower, the coronet or cup is also yellow, and nearly fills the inside of the flower. It has six green midribs, and is jagged on the edges. The tube of the flower is also green. The leaves sheath at the bottom, and form a round column over the bulb. There is a beautiful sulphur-coloured cross between it and *Calathina*, which is figured in "The Botanical Register," vol. xx., plate 1665; and in "The Botanical Magazine" the species is called *Pancratium Amancæ*, vol. xxx., plate 1224. It should always grow in the middle of a heap of sand, and out of doors, and not be planted till the beginning of May, but it will grow in a pot, and even force to flower a month earlier.

ISMENE CALATHINA.—The bulb, leaf, and growth are very much like the last, but the plant is stronger; the flower and cup are large, and pure white; the flower is full 4 inches across; the tube is green, and there are six greenish stripes in the cup, as in that of *Amancæ*. No one knows where it is a native of, but it is more hardy and less fastidious about sand than the last. It was first introduced from the gardens about Buenos Ayres. The seedling between it and the last is fertile, and has crossed again with the pollen of *Amancæ*, and a much harder plant with a better flower is the result. Then, if *Calithauma* is really an *Ismene*, we have emerald-green, golden-yellow, and the most silvery-white, to mix and vary into all possible hues, for the front borders of our greenhouses and south walls. Add to this the delicious odours in the half-hardy white *Hymenocallis*, not to mention the exquisite fragrance of *H. speciosa*, from the stove, and surely it is worth while to make a fresh start with the *Pancratium*-like bulbs, and not go on for everlastingly with such trumpery things as common Tulips and Poppy Anemones.

ISMENE DEFLEXA.—Another Peruvian species, with white reflexed flowers (not green), which comes the nearest to *Elisene*, being, as it were, the connecting link between the two genera, but in truth *Choretis glauca* and *Hymenocallis rotata* are just as true links as *deflexa*, only we must not say so botanically; but let the cross-breeder go to work, and all these links will snap asunder like anything.

ISMENE KNIGHTII.—This is the old, beautiful, glittering, white *Hymenocallis rotata* from Florida, where it grows, near Mobile, in swamps and ditches, very deep indeed in the mud; bulbs of it have been dug out from the depth of 2 feet.

ISMENE MACLEANA.—This is another large white flower, which is one of the plants celebrated by the Peruvians under the name of *Amancæ* and at the foot of the mountain on which it grows is held one of the greatest festivals of the Portuguese Church, at Lima, called the Festival of the *Amancæ*. At this festival they all wear nosegays and other ornaments made of this flower; but they put it into the stove, as usual, in the Botanic Garden, at Glasgow, to where Mr. Maclean sent it, and the probabilities are that they killed it outright. None of the family can bear the stove with impunity.

ISMENE VIRESCENS.—This pretty little plant flowered with the Horticultural Society in the summer of 1840. It was sent to them from Cusco by Mr. Pentland. Many things that were sent by Mr. Pentland from the highlands of Peru have been lost through not knowing what

temperature to give them; and very likely some of the Fellows of the Horticultural Society, to whom *Ismene virescens* had been sent, soon lost it by placing it in the stove. When the flowers are in the bud they are green all over, look like so many green *Coburgias*, but when they open they are whitish or greenish-white inside; rather small for this genus, but very neat, and they emit an agreeable lemon-like scent; the bulb spawns well, and is thus easily multiplied by offsets.—C. B.

SAXIFRAGA GRANULATA FLORE-PLENO.

The present plant furnishes us with a striking instance of the way in which our native plants are neglected in modern gardens. Many of our rarer British plants are no doubt difficult to cultivate, but the majority of them, and this one in particular, will flourish almost anywhere, the drier and stonier the better. In many old-fashioned gardens we have seen large patches of it in the mixed border, and a prettier sight during the

Fig. 24.—*Saxifraga granulata flore-pleno*.

months of April and May is certainly not surpassed by a large majority of the exotic plants we cultivate.

When the plant represented in the cut (fig. 24) is only an illustration of what may be done with our common Meadow Saxifrage by good cultivation, we need not despair of yet adding to our gardens valuable plants from the weeds we see around us in the fields. It also makes a handsome rockery plant, and when once established, covering dry stony slopes with surprising rapidity, the tubers are all the better for a roasting during the summer. It may be easily increased by division of the roots.—M.

ORCHIDS AT HILLINGDON.

IN noting the success achieved with Orchids in the vineries there, (see p. 87), I stated there were other Orchids which merited notice, and I

will now refer to them briefly. The Cattleya house is 30 feet in length and 13 feet in width. One plant of *C. Sanderiana* was bearing a spike of six flowers, and the individual blooms measured 9 inches across. The colour was uncommonly rich, and the specimen altogether a fine one. There were some scores of fine healthy plants of *C. Mendeli* in flower, and they had a gorgeous appearance; indeed I never saw so many fine *Mendeli* in flower at once or in one house, and this is a special and much-valued variety there. The stock did not represent all that had been bought in, as many had been weeded out from imported batches as they bloomed for the first time, and it was only the cream which had been retained, which may account for the good impression they made on me. Some of them 10 inches across were slightly shaded on the petals, while others were as white as snow, with very deep-coloured lips, and these we admired most. There were some hundreds of blooms, and when massed together the effect was quite unique. There was a good batch of *Cypripedium Veitchi* in this house, the plants being remarkable for the very rich colour and fine health of the foliage and the numerous blooms each one was bearing. *Lælia purpurata* was bearing six large blooms on a spike. *Odontoglossum vexillarium* was well represented, one plant, probably one of the best of them, bearing eighteen spikes of bloom, but most of the *Odontoglossums* were to be seen in the house devoted to this genus, which contained about 2000 plants of different varieties, *O. Alexandræ* being largely represented. Many of the plants were growing in shallow pans, and Mr. Hill, the able cultivator, thinks it is quite impossible to overdo them with drainage. In another house we saw many plants of *Phalænopsis amabilis* and *P. Schilleriana*, not in flower, but with capital foliage, large, clean, and healthy. A plant of *Saccolabium guttatum* in this house was bearing thirteen large spikes. There was also a large batch of *Cypripedium Spicerianum*, the plants being grown in shallow pans with plenty of drainage, and the foliage was compact, abundant, broad and healthy. A plant of *Cypripedium niveum*, which was growing in a pan, had twenty-one open blooms, and this, like several more of the best varieties in the class, were exceedingly good plants. So far as I could see and understand, the system of growing Orchids there is a thoroughly common-sense one, extremes of all kinds, such as very high temperatures and the like, being avoided, and it would be quite impossible to meet with a better managed collection of these valuable plants. Master and man take the deepest interest in them, and it is pleasing to record the success which has attended their efforts in selecting good varieties and cultivating the same.—M. M.

AUTUMN-SOWN ANNUALS.

From the middle of April to the middle of June is always our worst time in the flower garden, whether its ornaments be planted in masses, or only in the mixed way. Annuals are uncertain in summer, as we all know, and few people like to trust to more than a very few sorts of them for keeping the beds full for any length of time, too, the first difficulty a new beginner meets with. He is no gardener, but he wants flowers, and would like to try his hand at something cheap to get experience. No plants are cheaper than annuals, and from the present time to the first week in September is the time to sow a number of them.

When the beds and borders of a mixed flower garden are dressed up in the spring, and all the established plants have sticks or labels set to mark the places, all the spare ground ought to be immediately filled with the different kinds of annuals that were sown in the autumn, for they are as easily removed and replanted as Cabbages, and coming into flower just at the time we are most in need of their aid, it is our own fault if we do not come up to the mark six weeks earlier every year than most of us are now in the habit of doing.

Like all other crops, annuals sown in the autumn are liable to be injured by the weather. A very mild and late autumn is much against them, because they grow too rank, and are very liable to be cut off by a very severe winter. The soil should be light and poor, and the situation an open airy spot, away from where fallen leaves are likely to gather in heaps by the wind. This gathering together is the very worst thing I know of for any seedlings; for if such quantities of leaves rest on the seed bed for a week, the little seedlings are either smothered or made so tender and blanched that the first dry wind or cold night finishes them. The soil should not be dug more than 3 inches deep, and the seed should be sown thin; a deep bed is likely to encourage the seedlings to grow too fast and bulky, and so make them more liable to be cut with frost; and if they are thick in the bed, the one helps to draw up the other too weak and spindly. Like many other causes of success in gardening, attention to these little matters is more essential than great skill or practical knowledge.

The best thing to cover seed-beds in the autumn is one-half light soil and one-half finely sifted coal ashes, from which the very fine dust and the rough cinders are taken; the first few rains will wash down all the finer particles of this compost for the roots to work in, and the surface is left gritty and porous, so that the stems and collars of the seedlings have free air and elbow room, instead of being jammed in a sour crust of rank earth, as would be their condition if they were sown on a rich, strong soil. A west aspect is by far the best for them, as then they are less liable to suffer from hard frosty nights, followed by very sunny mornings, or what we call extremes of weather. New seed of many kinds of annuals is not so good to sow in the autumn as old seeds, because the newer the seeds the more strong and healthy the seedlings, and, therefore the more liable to suffer from a hard or long winter.

Red and white *Clarkias* are well worth growing, and no winter kills them when self-sown. *Collinsia bicolor* and *C. grandiflora* are the two best of that family; they also are hardy enough to stand most winters.

The two yellow *Eschscholtzias* are as hardy as Wheat or Barley, and though not annuals they do much better if sown and treated as such, first in September, and secondly about the middle of April; if they are to be transplanted, it should be done when they are quite young. The blue and spotted *Nemophila insignis* and *N. maculata*, also *N. atomaria*, pass over almost any winter, and come into bloom before April is out. *Eucharidium grandiflorum* ought to be grown, and the plants stand a smart winter. *Godetias* are as good as they are gay, and as hardy as a Scotch Crocus, and they will be the brighter in flower, and more manageable in plant if they are planted in poor soil rather than rich; but, recollect, if poor, it must be deep and well worked. Stunted growth is quite a different thing from subdued growth caused by sandy soil well tilled. The flowers of all the *Godetias* show brighter when the plants are in this subdued growth. *Gilia tricolor* is hardy and very attractive; this and *Collinsia bicolor* are the two best lilacs. *Erysimum Perofskianum*, when sown in September, planted out in the beginning of March, and trained down to the surface of the bed as it grows, comes into bloom at the beginning of May, and lasts till midsummer, or longer, and, so treated, is one of the very finest beds ever seen in May; but if allowed to grow its own way you might just as well have a bed of seed Turnips. A second sowing of it the first week in April, and again about the end of May, would carry it right through the season till the frost came. Six or seven plants of it put into pots about the new year would come in finely for the greenhouse in April; but it will not stand forcing—the protection of a greenhouse or pit is as much as it can safely endure. *Lasthenia californica* and *Limnanthes Douglasii* are two yellowish kinds, which are grown for making up this colour in May. *Bartonia aurca*, a beautiful clear yellow flower on a weedy-looking plant, sown now, and transplanted into very poor, light soil early in April, will flower in May, and be much better than under any other treatment. The flowers are as rich as those of *Allamanda*; but the plant is no better than a Dock in good soil. *Leptosiphon densiflorus*, a very dwarf lilac, or purple-and-white-mixed flower, stands the winter well. *Lupinus nanus* has quite a different character when allowed to grow on slowly all the winter. It blooms from May to the middle or end of August from seeds sown about the middle or end of September, provided the plants are not allowed to ripen any seeds. Another sowing, about the first week in May, would carry it on to the middle of October. *Silene penula*, *S. compacta*, and *S. Schafta* are the best of the Catchflies, and are always best from autumn sowing. The Virginian Stock flowers in April if sown now, and all the varieties of the branching Larkspur will bloom most part of the summer, if sown earlier in September. Cornflowers (*Centaurea cyanus*) should be sown now for cut flowers.—FLOWER GARDENER.

ROYAL HORTICULTURAL SOCIETY.

AUGUST 11TH.

A VARIED but not extensive display of plants, flowers, fruits, and vegetables constituted an interesting meeting on Tuesday last, the chief features of which were Mr. T. S. Ware's superb collection of hardy flowers, Messrs. Kelway's *Gladioli*, and Messrs. Rivers' Gooseberries.

SHOW OF PLANTS AND FLOWERS.

The prizes offered for these did not bring a very strong competition, and several of the classes were quite unrepresented. The best competition and the best plants were those entered in the class for six *Caladiums*, in which Messrs. J. Lving & Co., Forest Hill, won first honours with well-grown specimens of some of the most effective varieties in cultivation. The plants were 3 to 4 feet in diameter, with large, well-developed, and highly coloured foliage, the varieties represented being as follows:—*Mithridate*, red and green; *Elsa*, white with green veins and red blotches; *O. natum*, green with red veins; *Candidum*, white with green veins, very distinct and good; *Madame Fritz Koehlin*, white with green and red veins; and *Ferdinand de Lesseps*, green with a red centre. Mr. Chadwick, Hanger Hill House Gardens, Ealing, and Mr. H. James, Lower Norwood, followed, showing smaller plants, but also of good varieties. *Fuchsias* were not of great merit, and second prizes only were awarded to Mr. Lambert, Elingdale Lodge, Herne Hill, for six and four plants, the former standards fairly well flowered and the latter dwarfier compact plants, the best of the varieties in each case being *Conspicua*, *Warrior Queen*, and *Scarcity*. The same exhibitor was first with twelve plants, small but healthy examples, Mr. H. James following.

Of the cut flowers the most important exhibit was the collection of *Gladioli* from Messrs. Kelway & Son, Langport, Somerset, which comprised 100 spikes, nearly all distinct varieties, massive compact specimens, with large brilliantly coloured and varied flowers. Several varieties were new and were honoured with certificates, as will be seen in our list of certificated plants at the end of this report. These were *Milton*, *Galatea*, *Abas*, and *Lorna*, while of others not so distinguished the following were especially worthy of note:—*Irex*, cream, centre crimson, with red streaks; *Queen Mary*, white, crimson central blotch; *Calephon*, salmon scarlet, white centre; *Joseph Broom*, white, streaked with crimson; *Lady Carrington*, very pale pink, a charmingly delicate variety; and *Opiter*, deep scarlet, white centre veins. The *Asters* showed the effects of the weather in their comparatively small size, but they were fresh and bright in colour. The only competition was in the class for twelve *Chrysanthemum* or *Pæony*-flowered varieties. Mr. A. S. Price, Park-side House, Ewell, Surrey; Mr. J. S. Cooper, Windhill, Bishop's Stortford; Major Scott, Wray Park, Reigate; and Mr. W. Smith, Bishop's Stortford, taking the prizes in the order named, the last two having equal third prizes. Mr. T. S. Ware secured the prizes for *Hollyhocks*, their twelve stems of double varieties being exceptionally fine, the blooms large and the colours rich.

Vegetables.—Prizes were offered by the Society for four Tomatoes in pots, Mr. Chadwick being the only exhibitor, being awarded the first prize for fairly well-fruited examples of *Sutton's Earliest* of All and *Reading Perfection*. Messrs. Sutton & Sons, Reading, also offered prizes for three dishes of Tomatoes, twelve fruits to form a dish

PRETTY FACE (*Brodiaea ixioides*).—Perhaps this is more generally known as *Callioprora lutea*, which is, in my opinion, a more satisfactory name for it, as it certainly is very distinct in appearance and colour from the other members of the genus *Brodiaea*; but structurally I suppose its difference is too slight to warrant generic separation. It produces slender flower stems from a foot to 18 inches high, bearing a large umbel of flowers on slender pedicels at the top, which are individually about an inch across, of a deep golden yellow colour, with a brown medial vein in each segment of the perianth. Generally more than one scape is sent up from each bulb, and as they are many-flowered it is a neat and extremely pretty bulb for the hardy flower

garden. Serono Watson says in his "Californian Flora" that it varies from rich yellow to nearly white. Now it so happens that I have bulbs collected from the San Diego district of California which are now in flower with the type, and inside the perianth is quite white, while the back of each division is marked with a reddish-brown midrib. It appears to be rather stronger growing than the type, with great umbels of white star-like flowers, and mixed with the latter it forms an exceedingly beautiful and chaste picture, which I would not be without for a great deal; indeed from what I can learn I have quite a treasure in thus obtaining such a good albino of "Pretty Face." My bulbs thrive remarkably well in a warm position, well drained, in light rich soil near the city of Chester, but I took care when planting to surround them with sand and ashes from burnt garden refuse, and evidently they thoroughly enjoy such treatment.

BRODIAEA LAXA.—This is another very handsome species, producing slender many-flowered stems, which vary greatly in height. Those flowering with me are about a foot high; the perianth is tubular bell-shaped, an inch and a half long, of a rich tyrian purple, but the colour varies. I have seen it much paler, indeed a dull purple or pale blue; it also has its albino form, which is, however, very scarce. I have bulbs but not yet strong enough to flower. *A. Bridgesi* is very near *B. laxa*, but the perianth is not so long, and there are points of difference in the stipe supporting the ovary and the filaments, but these are points which the ordinary gardener cares little about, suffice it if any plant is superficially distinct. These both thrive under the same conditions as *B. ixioides*.

PINK TOM THUMB SCARLET.—About a dozen years since Messrs. Veitch & Sons exhibited this bright little gem at the Richmond Flower Show, and I was very much struck with its distinctness and effectiveness. For years I neither heard nor saw anything of it, and it was with difficulty that I secured a plant of it last year. I understand Messrs. Veitch have quite run out of stock, for what reason I cannot imagine. Is it very difficult to propagate? I should be glad to hear if any reader of the Journal has any experience to relate concerning it. Three small plants in my garden have now a bloom each expanding, bright scarlet, very large for such a pigmy variety, for they are certainly not more than 4 inches high in all. They are doing well, producing a fair supply of grass, which will be carefully looked after, as such a peculiar beauty well deserves spending some little trouble upon.

LILIUMS.—There is such a number of these quite happy in the outside garden. Some should certainly be grown wherever accommodation can be found for hardy bulbs; for instance, such as the old *L. candidum*, *L. testaceum*, *L. chalcedonicum*, *L. colchicum*, *L. umbellatum*, &c. Beginning with *L. candidum*, called in its Italian home the "Madonna" Lily, what is purer? Fancy its tall spikes rising above a bed of dwarf dark Roses. So effective is such a picture that we would go several times a day to admire it. Such a picture I have beheld for many days past in a neighbour's garden, and live with the hope of having something similar in my own next year. *L. testaceum* is one of the most unique Lilies we have, supposed to be of hybrid origin between *L. candidum* and *L. chalcedonicum*. Very likely. It has the habit of the first, with a colour infusion of the second; *candidum* in flower form, with a colour, rich apricot or nankeen, between the two, sweetly scented, abundantly distinct, free-growing in light rich soil, there is no reason why it should not be generally grown, yet I am informed it is getting scarcer every day. *L. chalcedonicum*, often called the Scarlet Turk's Cap, is also much dearer than it was a few years back, but it will always command a good figure, as it does not increase very freely, and is in good and steady demand. It will soon be in flower with me, and its rich scarlet blossoms are always welcome. Mr. E. Jenkins rightly praises *L. pomponium*, which is also scarlet-flowered, but it is a much more slender grower, and earlier in blooming than *chalcedonicum*, and certainly well deserves general cultivation. The Caucasian *L. colchicum* or *Szovitzianum* is one the handsomest and easiest grown, provided it receives liberal treatment. By this I mean plenty of manure in some form or another; it also most enjoys a rather stiff soil. I was at Edge Hall Gardens the other day, and there Mr. Wolley Dod grows it to perfection, and he says his success is due to the use of plenty of manure. Crushed bones are mixed with the soil about the bulbs in liberal quantities, and their present condition speaks well for the treatment—tall stout stems these are, 5 feet high or more in some instances, with large heads of the deep lemon finely spotted flowers. In future treatment of this Lily one need not be afraid of using manurial material when planting. The varieties of *L. umbellatum* are among the very best Lilies for outside culture. They flower very freely, and when estab-

lished form good clumps of dwarf stems supporting heads of bright orange-red flowers. The colour varies in the different forms. Some are all but free from spots, while others are copiously spotted. The best are erectum, Sappho, grandiflorum, and Incomparable, all dwarf and exceedingly showy, well adapted for massing and bedding, but like nearly all Lilies they require a liberal supply of manure, and some good leaf soil is a great help to them. The Panther Lily (*L. pardalinum*) is very showy now. I do not keep the varieties distinct, as I have repeatedly found such a variableness in bulbs collected from the same locality that I allow mine to remain somewhat mixed, certainly there is a difference both in colour and spotting. The type is distinguishable from the brighter coloured variety *californicum*, but they are all handsome and free-growing. Many say this will not do without boggy soil, but that is mere assumption, they certainly will do well in ordinary soil if enriched with manure.—T.

REVIEW OF BOOK.

Greenhouse and Stove Plants. By THOMAS BAINES.
London: John Murray.

THE author of this work has obtained a well-deserved fame as a plant grower and exhibitor, and his production therefore comes with the greater weight, as recording the experience of a successful man. About 500 genera are arranged in alphabetical order. The culture in the majority of cases is given very fully, and a list of species or varieties is added to each. Chapters on general culture are prefixed to the alphabetical portion, and necessarily contain many useful hints. Palms and Ferns are treated separately in these introductory remarks, and in most cases afterwards the author has contented himself when noticing a genus of Palms or Ferns by referring to these general instructions. As regards many Ferns this may occasion some little difficulty, for the culture of such genera as *Gymnogrammas*, *Nothochloenas*, and *Cheilanthes* differs considerably from that required by most others. In a few instances, also, it may be noticed that there is much disparity in the space accorded to genera. Thus we find two columns are appropriated to *Chrysanthemums*, exclusive of a list of varieties, whereas Mr. Baines has thought it necessary to give seven columns to the *Clerodendrons*. These, however, are of comparatively small importance, for the cultural instruction is sound, and perhaps will prove more serviceable where it has been judiciously condensed than in the more extended chapters.

As an example of the style adopted we will extract a short chapter on the

BERTOLONIAS.

These small-growing stove *Melastomads* almost vie, as regards beauty of leaf-marking, with the most charming of variegated Orchids. They are natives of the hot countries of the east, and to grow them well and bring out and preserve their leaf-marking a high temperature is required. They are plants of quite a softwooded character, and do not grow to a height of more than 6 or 8 inches. They strike freely from cuttings made from shoots in a half-solidified condition. They may be struck at any time when obtainable in that state, but are most likely to be in proper condition in spring. Each cutting should consist of at least a couple of joints. Put them in small pots singly in sand, and cover them with a propagating glass, but do not keep them so close as to cause damp, as soft growth of a nature such as these, if too close and moist, is liable to rot. Give as much water as will prevent flagging, keep in a warm stove temperature, and shade when the sun renders this necessary. They will soon make roots, when they should be given more air, and, as they get established, be removed to larger pots. The soil best suited to them is fibrous peat mixed with some sphagnum sand, and crocks. A temperature of from 65° to 70° in the night during the growing season, with a rise by day proportionate to the warmth of the weather, will answer; 60° by night, with 5° or 10° more in the day, will do for the winter. Some growers keep the most delicately marked kinds almost wholly covered with a bellglass, as *Anectochili* are sometimes grown, but this treatment makes the plants very soft and tender; yet they do not do well if placed under drying influences, as where much air is admitted. If in a position of this kind, a propagating glass partially closed over them, so as to somewhat confine the air and prevent its getting too dry, will be an advantage. The plants must always be shaded when the sun is at all powerful; they should be stood where a moderate amount of light will reach them, and the soil must never be allowed to get dry. Little root-room will suffice, but, as the shoots are of a semi-procumbent habit, they must have as much space as will allow them to spread. They do well with the pots plunged in a shallow pan filled with a mixture of chopped sphagnum and sand, in which way, if a number of plants are so plunged, they are very effective.

The undermentioned kinds are all handsome:—

B. guttata.—From South America; has green ovate leaves, the upper surface spotted with rose. There are three forms of this plant, differing somewhat in the appearance of their leaves, but all handsome.

B. Houtteana.—A Belgian variety, most likely of garden origin, with beautiful foliage. Its deeply ribbed, lustrous, olive-green leaves are spotted with rose; the ribs are marked with rose-tinted hues.

B. margaritacea.—A Brazilian plant; has five-nerved ovate leaves, the ground colour olive-green with lines of white spots, the under surface reddish-purple.

B. primulaeflora.—This is a species from Ecuador, with ovate-lanceolate leaves, dark green in colour. It bears very handsome rose-coloured flowers.

B. superbissima.—This is also, we believe, a garden variety. It has large, broadly ovate leaves, in colour dark green, with large rose-coloured spots within the margin and smaller spots on other portions of the leaf.

INSECTS.—We have found these plants little troubled with insects except aphides, which sometimes affect them. Fumigation is the remedy.

The nomenclature is accurate throughout, the type is good, and the book is well bound.

POTENTILLA MENZIESII.

THE order Rosaceæ, to which the genus *Potentilla* belongs, may be regarded as one of the most important of the vegetable kingdom; for it includes within its limit not only some of the handsomest of our garden flowers, but also comprehends all the most valuable of the fruits of the temperate regions, such as the Apple and Pear, and the different varieties of the Peach, Plum, Apricot, and Cherry. Leaving aside, as foreign to our present purpose, the fruit-bearing genera, we may claim for the *Potentillas* a high rank among the ornamental plants of the order.

Of the 150 species and varieties known, all, with scarcely any exceptions, are interesting plants, and a considerable number of them are indeed scarcely inferior in beauty to any of the hardy perennials.

Most of the highly coloured varieties now so common in gardens are hybrids; the flowers of the wild species being, with very few exceptions, yellow or white.

Among those species most deserving of cultivation may be named *P. rupestris*, with pretty pure white flowers produced in May; *P. pyrenaica*, also an early bloomer, of dwarf habit, yielding bright yellow blossoms in profusion; *P. mollissima*, with primrose yellow flowers; *P. Richardsonii*, also yellow, with foliage silvery beneath; *P. atrosanguinea* and *P. formosa*, two Nepaulese species, the former with deep purple, and the latter with pale cherry-coloured flowers. These two species are not only interesting for their intrinsic beauty, but also as being the parents of many of the numerous hybrids which have adorned our gardens for years past. As one of the earliest and best of these we may name

Fig. 25.—*Potentilla Menziesii*.

Russelliana, formerly a very popular plant, but now superseded by varieties with greater breadth of petal and brighter colours, of which *P. Menziesii* may be regarded as the type. Equally desirable are the varieties *Hopwoodiana*, *Macnabiana*, *Smoutii*, *Striata multiflora*, all more or less distinct in colour. But beautiful as these are, they are eclipsed by the numerous double and semi-double varieties of recent introduction, which have the advantage of not closing their flowers so completely as the single-flowered, and their blossoms are also of longer duration. Some of the best of these are *Louis Van Houtte*, large, deep crimson; *Belisaire*, bright vermilion; *William Rollisson*, reddish yellow and orange; *Rosæflora plena*, rich velvety vermilion, edged with yellow; and *Vase d'Or*, canary yellow, all first-class plants, worthy of being added to the most select collection of perennials.

All the species and varieties we have enumerated are perfectly hardy, and of the easiest cultivation, though it cannot be said that they will flourish in any description of soil. They succeed best in a good rich earth of some depth, and require, in summer, a plentiful supply of water, especially about the time the flower stems are thrown up. We have never seen the *Potentillas* grown in beds, but we think that such an arrangement would be exceedingly interesting if a proper selection of plants were made. For the centre of the bed one of the shrubby species, such as *fruticosa*, or *floribunda*, both with yellow flowers, and growing about 4 feet high, would be well adapted; and around these might be grouped the erect-growing herbaceous species and varieties, reserving the trailers, of which there is a fair sprinkling, for the outer circle.

They are all readily increased by dividing the roots early in spring, and as these descend to a considerable depth, care must be taken that the fibres are not broken. Many of the species ripen seeds, from which new varieties may often be raised, and all the seedlings would flower the second season after sowing.

A wide field is here open to the amateur florist, and, with a little care and attention, he could scarcely fail to originate some valuable additions to this ornamental family.

There is an allied genus, of which a few species are occasionally found in gardens, and which fully equal in beauty the *Potentillas* we have named; we allude to the *Geums*. They are distinguished from the *Cinquefoils* by their lyrate leaves, reflexed calyx when in fruit, and more particularly, by the style of the numerous little granular seed-vessels being jointed. *Geum coccineum* (the *G. Quellyon* or *chiloense* of some authors), is an extremely handsome plant.

The properties both of *Potentilla* and *Geum*, as well as of *Tormentilla*, another allied genus, are very similar. Many of the species of the three genera are astringent and aromatic, and are all perfectly innocuous. The common *Potentilla anserina*, or *Silver Weed*, has been used by tanners; and *P. reptans*, another English species, of which a pretty double-flowered variety is sometimes met with in gardens, was formerly employed as a febrifuge.—W. T.

NETHER-EDGE FLORAL AND HORTICULTURAL SOCIETY, SHEFFIELD.

AUGUST 10TH AND 11TH.

THE sixth annual Exhibition of the above Society was held on land adjoining the tram terminus on Monday, the 10th inst.

The exhibitions of this Society have become very popular, and are largely attended, owing principally to the spirited way in which the Committee have provided other attractions in addition to those of the Exhibition. On this occasion the principal attractions consisted in the splendid band of the Scots Fusilier Guards from South Kensington for Monday the 10th, and on the second day (Tuesday the 11th) the fine band of the West York Yeomanry Cavalry, and in the evening a display of fireworks by Messrs. Brock & Co., London.

The two exhibition tents were fairly well filled, and the quality of the exhibits was generally considered to be superior to what has previously been seen at the shows of the Society.

In the open class the principal prize was offered for a group 10 feet by 10 feet arranged for effect, which brought five competitors and a very close competition. The first prize was awarded to Mr. B. Crossland, Richmond Nurseries, for a low and somewhat flat group, consisting principally of a very dense groundwork of *Adiantum cuneatum*, relieved by a few fresh plants of *Bouvardias*, *Tuberous Begonias*, *Crotons* and *Dracenas*, with a moderately good plant of *Cocos Weddelliana* in the centre. The second-prize group, exhibited by Mr. Hiram Shaw, nurseryman, Richmond, which was by many considered to be superior to the one last referred to and the best group shown, had as a centre a fine *Cocos*, around which were arranged a number of good plants of *Campanula pyramidalis*, blue and white, interspersed with *Hydrangeas paniculata* and *hortensis*, *Hyacinthus candicans*, and *Lilium eximium*; also some finely coloured *Crotons* and *Dracenas*.

The old-fashioned Chimney *Campanula* was also freely used in the group to which the third prize was awarded, and which was shown by Mr. Thomas Foggin, gardener to Mrs. G. Wilson, Tipton Hall. It appears to be one of the most effective of plants for this purpose. Messrs. Fisher, Son, and Sihray, Handsworth Nurseries, exhibited a fine group of beautiful and rare plants not for competition.

The competition in the class for six stove or greenhouse plants was not strong. The first prize was taken by Mr. Thos. Foggin with a fairly good six, containing good specimens each of *Stephanotis floribunda* and *Dipladenia Brearleyana*. Ferns were well shown in numerous very fine collections, especially in the classes for British Ferns. In the latter Mr. John Eadon secured first prizes in the classes for twenty-four and for six plants, showing beautifully fresh and healthy specimens, and numerous rare and choice varieties. The second place was obtained by Mr. J. G. Newsham, and the third by Mr. H. Davy, who each staged collections of very high merit. Next to the groups the collections of British Ferns were undoubtedly the finest feature of the show. Carnations and Picotees were shown in fine condition by Messrs. Simonite of Sheffield, and Proctor of Chesterfield. Dahlias were also very good from Messrs. Chas. Storey & Proctor. Roses were not good.

Fruit was only very moderately shown, the best Grapes being shown by Mr. G. F. Shorten, gardener to — Mosely, Esq., and Mr. W. Collier, gardener to J. Eaton, Esq.

There were some fairly good collections of vegetables, Mr. Thos. Foggin securing nearly all the first prizes for the same. An unfortunate occurrence happened, almost immediately after the judging was completed, to the tent containing the local gardeners' and amateurs' classes, which, owing to a heavy gale which was blowing at the time and the exposed situation, suddenly collapsed and fell with force upon the exhibits contained therein, breaking down the staging and destroying most of the plates and dishes with the fruit, &c., exhibited thereon. The plants were also much broken and damaged.

A fresh tent was procured and erected as speedily as possible, but this portion of the Exhibition was irretrievably spoiled. During the afternoon a luncheon was provided in a tent erected for the purpose, and about fifty gentlemen, amongst whom were Mr. Ashmead Bartlett, M.P., Alderman Hunter (ex-Mayor of Sheffield), who presided, Alderman Gee (Mayor of Chesterfield), Alderman Gainsford, and many more influential gentlemen.

ORCHIDS IN AUSTRALIA.

THE following extracts from a letter which I have received from my brother residing in Australia may be interesting to those of your readers who are cultivators of Orchids:—"Thanks for your graphic accounts of the exhibition of the Orchid Congress at South Kensington. The Orchids are a very interesting family of plants. Here, as well as in England, much attention is paid to their cultivation. The late Sir W. MacArthur spent several thousand pounds in building an Orchid house, and he used to give

sometimes from £50 to £150 for rare species from the West Indies and South America. We have *Dendrobium speciosum* and *Calanthe veratrilifolia* in the adjacent mountains, but most of the species, excepting some in Queensland and North Australia, are small. The whole number of species now described for Australia are 500. The plant named after me is *Prasophyllum Woollii*, a small species found by me several years ago.

"My friend Mr. Fitzgerald is publishing a work on Australian Orchids with beautiful illustrations; the Government assisting in the printing."—C. W.

NOTES ON ROSES.

I HAVE read with much interest Mr. Muir's "Notes" (p. 105), and am induced to make some remarks on them. I am not able altogether to agree with him, and someone else may remark the same in my own case. In my experience 1885 is not a first-class Rose year. In this valley of the Mole the May and even June frosts were constant. I never remember so many damaged blooms; in fact, it was the exception for the first buds to come true. With regard to the Crystal Palace Show, it is true it is a 7s. 6d. day, but the smallest exhibitor finds entrance as a matter of course, and breakfast tickets are given with the utmost liberality. In respect of Her Majesty, I fear we are not likely to see her in the boxes at present. My own impression is that this is one of the Roses that will bear starving, and will probably look better when half the size of some of those that have been exhibited. It is any way a most grand Rose, and Mr. Bennett may be congratulated at having now at any rate compelled admiration and acceptance of his Pedigree Roses. His Mrs. John Laing is also grand in substance, but of that light pink colour which does not blend well with others.

I fear I must also disagree about *Merveille de Lyon*. There were many in the class in which I was judging at the N.R.S., but there as elsewhere I hardly saw one where the eye was not apparent. It seems the habit of this Rose beyond all others to show this. Otherwise, as Mr. Muir says, in size and purity it is all that can be wished. The real white A. K. Williams has yet to be found. This was not perhaps an A. K. W. year, though many grand blooms are recorded as shown. This is one of the very best Roses for standing that I know. This certainly was an Ulrich Brunner year, and he will have forced his way into many fresh orders. Lady M. Fitzwilliam is not classed with the Teas; indeed, at one great show it took the silver medal as the best amongst the not-Teas. I think most will agree with Mr. Muir in his closing sentence, that practical notes on the Rose subject are valued and read with interest by Rose growers old and young.—A. C.

THE PITCHER PLANT.

THE variety of the Pitcher Plant (*Sarracenia variolaris*) found in North America is carnivorous, being a feeder on various animal substances.

Mrs. Mary Treat, an American naturalist, made, a few years ago, several experiments upon the plants of this species to be found in Florida; and to the labours of this lady the writer has been indebted, in some measure, in the preparation of this paper.

The *Sarracenia* derives its name of "Pitcher Plant" from the fact of its possessing the following curious characteristics. The median nerve is prolonged beyond the leaves in the manner of a tendril, and terminates in a species of cup or urn. This cup is ordinarily 3 or 4 inches in depth, and 1 to 1½ inch in width. The orifice of the cup is covered with a lid, which opens and shuts at certain periods. At sunrise the cup is found filled with sweet, limpid water, at which time the lid is down. In the course of the day the lid opens, when nearly half the water is evaporated; but during the night this loss is made up, and the next morning the cup is again quite full, and the lid is shut.

About the middle of March the plants put forth their leaves, which are from 6 to 12 inches long, hollow, and shaped something like a trumpet, whilst the aperture at the apex is formed almost precisely in the same manner as those of the plants previously described. A broad wing extends along one side of the leaf, from the base to the opening at the top; this wing is bound, or edged with a purple cord, which extends likewise around the cup. This cord secretes a sweet fluid, and not only flying insects, but those also that crawl upon the ground, are attracted by it to the plants. Ants, especially, are very fond of this fluid, so that a line of aphides, extending from the base to the summit of a leaf, may frequently be observed slowly advancing towards the orifice of the cup, down which they disappear, never to return. Flying insects of every kind are equally drawn to the plant; and directly they taste the fluid they act very curiously. After feeding upon the secretions for two or three minutes they become quite stupid, unsteady on their feet, and whilst trying to pass their legs over their wings to clear them, they fall down.

It is of no use to liberate any of the smaller insects; every fly, removed from the leaf upon which it had been feeding, returned immediately it was at liberty to do so, and walked down the fatal cup as though drawn to it by a species of irresistible fascination.

It is not alone that flies and other small insects are overpowered by the fluid which exudes from the cord in question. Even large insects succumb to it, although of course not so quickly. Mrs. Treat says:—"A large cockroach was feeding on the secretion of a fresh leaf, which had caught but little or no prey. After feeding a short time the insect went down the tube so tight that I could not dislodge it, even when turning the leaf upside down and knocking it quite hard. It was late in the evening when I observed it enter; the next morning I cut the tube open; the cockroach was still alive, but it was covered with a secretion produced

from the inner surface of the tube, and its legs fell off as I extricated it. From all appearance the terrible *Sarracenia* was eating its victim alive. And yet, perhaps, I should not say 'terrible,' for the plant seems to supply its victims with a Lethe-like draught before devouring them."

If only a few insects alight upon a leaf no unpleasant smell is perceptible during, or after, the process of digestion; but if a large number of them be caught, which is commonly the case, a most offensive odour emanates from the cup, although the putrid matter does not appear to injure in any manner the inner surface of the tube, food, even in this condition, being readily absorbed, and going to nourish the plant. In fact, it would seem the *Sarracenia*, like some animals, can feed upon carrion and thrive upon it.

In instances in which experiments have been made with fresh, raw beef or mutton, the meat has been covered in a few hours with the secretions of the leaves, and the blood extracted from it. There is, however, one difference between the digesting powers of the leaves when exercised upon insects or upon meat. Even if the bodies of insects have become putrid, the plant, as has already been stated, has no difficulty in assimilating them; but as regards meat, it is only when it is perfectly sweet that the secretions of the leaves will act upon it.

The Pitcher Plant undoubtedly derives its principal nourishment from the insects it eats. It, too—unlike most other carnivorous plants, which, when the quantity of food with which they have to deal is in excess of their powers of digestion, succumb to the effort and die—appears to find it easy to devour any number of insects, small or large, the operation being with it simply a question of time. Flies, beetles, or even cockroaches, at the expiration of three or four days at most, disappear, nothing being left of them save their wings and other hard parts of their bodies.

The *Sarracenia* is, indeed, not only the most voracious of all known species of carnivorous plants, but the least fastidious as to the nature of the food upon which it feeds.—W. C. M. (in *Nature*).

CACTUSES AT HOME.

IN Utah, *Echinocerus phœniceus*, *Echinocactus Simpsonii*, *Mamillaria vivipara*, var. *neo-mexicana*, and *Opuntia missouriensis*, stand out in their native places and do well with frost 22° below zero; but they grow upon well-drained gravelly hillsides, and are usually covered with snow from Christmas to the following May. So much for the iron-clad Cactus. Then there are *Cereus Engelmanni*, *Echinocactus Whipplei*, *Echinocactus Sileri*, *Echinocactus cylindraceus*, *Opuntia rutila*, *Mamillaria chlorantha*, that grow with the *Agave Utahense* on the sandstone ledges, in many instances with hardly sand enough to cover their roots, and there are two Cactuses that stand out exposed to the fierce heat of the summer sun where hardly a lizard is to be found, with the thermometer down to zero in the winter.

In the Beaver Dam Mountains, west of St. George, growing in the sand on the limestone ledges with *Yucca brevifolia* are *Echinocactus Johnsoni* and *E. LeContei*. In this locality there is but little snow, but the thermometer often falls within 10° of zero.

The question has been asked of me very often lately as to when it rains and when it does not. Snows and rain commence about the 15th of December, and continue until about the 1st of May, when a period of drought sets in, lasting until about the 24th of July. This being a holiday it always rains, and it continues to rain until the last of August. At the higher altitudes where the first-named Cactus grow, frost usually follows a rain, let it be at what season of the year it may. Last night, June 11th, ice formed quarter inch thick, following a very unusual rain storm that came off last week.

A few years since I had a number of *Agave Utahense* that I wanted to keep until I could get orders for them. I planted them with a *Mamillaria vivipara* in a box of clay soil, and told the lady in charge of the place to water them occasionally. I was away for some two or three months. When I returned to get my *Agave* plants to send away I found them swimming in water, and was informed that they had been sitting on a back porch where they got the morning sun only with a pail of water from the well every morning. I expected that they were ruined, but to my surprise they were well supplied with new roots. I have, when collecting Cactus, set out on dry ground in favourable locations what I had left over after filling orders; but I have never had the good fortune to have any of them root as well as the *M. vivipara* set with the *Agave* noted.

A number of the readers of the "Gardeners' Monthly" have asked me to tell them about the soil that our Cactus grow in. *Cereus Engelmanni* arrives to its greatest perfection on the ragged edges of limestone ledges with a soil of clay and gravel. *Echinocactus Johnsoni*, *E. LeContei*, *M. chlorantha* and *Opuntia rutila* delight in a south-westerly exposure on the side of sandy and gravelly ridges with bed rock of limestone. *Echinocactus cylindraceus*, *E. xanthoides*, *E. Whipplei*, *Opuntia chlorotica*, *M. phellosperma*, are found on the west side of canons facing the morning sun, but never on the east side sand on sandstone ledges generally. *Echinocactus Sileri* on low hills, soil rotten gypsum. *Echinocactus phœniceus*, *E. Simpsonii*, *Opuntia missouriensis*, gravelly soil facing to south-west, or on top of high gravelly hills about the rim of the great basin. *Mamillarias vivipara* and *neo-mexicana* gain their greatest perfection in very tight clay soils amongst Sage brush.—A. L. SILER, Kane Co., Utah (in *American Gardeners' Monthly*).

CARYOPHYLLUS AROMATICUS.

THIS is a commercial plant of considerable importance, and has been known to this country for nearly a century. It is only cultivated in

choice and botanical collections of plants, where it flourishes in a soil composed of loam and peat, and must have a high steady temperature. It is propagated by cuttings inserted in sand under a bellglass. But while we speak of it and know it as a plant in our artificial mode of growing it, yet in its perfected state it is a tree of which the clove spice of commerce is the dried flower buds. Dr. Hogg in his "Vegetable Kingdom" states that the Clove is a tree 20 to 40 feet high, a native of the Moluccas, but now cultivated all over the East Indies where situations favourable to its growth can be obtained, and also in some of the West India islands. The cloves of commerce are the unexpanded flower buds, the corolla forming a ball on the top between the teeth of the calyx. They are first gathered when the trees are about six years old, and are either collected by hand or beaten with reeds so as to fall upon cloths which are placed under the trees to receive them, and dried either by fire heat or in the sun. The fruit, which is a dry berry, also possesses a very aromatic

Fig. 26.—*Caryophyllus aromaticus*.

taste and odour. The use of cloves in domestic economy is well known. Water extracts the odour of cloves, with comparatively little of their taste. All their sensible properties are imparted to alcohol; and the tincture when evaporated leaves an excessively fiery extract, which becomes insipid when deprived of the oil by distillation with water, while the oil which comes over is mild. Oil of cloves is obtained by distilling cloves with water, to which it is customary to add common salt in order to raise the temperature of ebullition; and the water should be repeatedly distilled from the same cloves in order completely to exhaust them.

HARDY FRUIT GARDEN.

STRAWBERRY BEDS.—Important work has now to be done in Strawberry cultivation. If new beds are to be made it must either be done at once or left till next spring—preferably at once if space can be had, but many gardens are so crowded with crops that the planting of Strawberries is put off till autumn, with the unsatisfactory result of the plants not becoming fully established before winter. If the soil is of a close heavy

texture let plenty of fine coal ashes be well worked into it, with enough manure, old and rich, to insure perfect fertility and thorough mechanical division. Then select strong-rooted runners, lift them carefully with large balls of soil and as many roots as possible, plant 1 foot apart in rows 2 feet asunder, give a plentiful watering, and continue to water three times weekly till the end of September. Run a hoe occasionally through the surface of the soil among the plants to keep down weeds and to keep the surface loose and open. If sewage can be had use it in preference to water, our object being to induce a robust autumnal growth and strong plump crowns to afford a truss or two of fine fruit early next season. Of sorts to be regarded as indispensable take Black Prince and Keen's Seedling for a warm corner or southern slope; for the earliest fruit and for open beds Marguerite, Sir Joseph Paxton, James Veitch, Hammonia, Dr. Hogg, Lucas, Sir Charles Napier, President, Unser Fritz, Bicton Pine (white), and Loxford Hall Seedling.

For new gardens, or wherever there is any feeling of doubt about which sorts will answer best for large beds, we recommend the planting of all we have enumerated, as well as small trial beds of all new sorts as they are introduced, so that clear knowledge of the comparative value of each sort may be had, and the best possible selection made. If new beds cannot be made now make nursery beds of runners planted about 9 inches apart in rich soil, and there is nothing better for this purpose than an old hotbed with soil and manure chopped up and well mixed. Keep these beds well watered and free from weeds, and next February or early in March remove the plants to permanent quarters, where they will be found to answer much better than when planted late in autumn. Let the plants of old exhausted beds be at once hoed up and cleared off, and the fruiting beds with the plants in full vigour should have runners and weeds hoed and cleared from between the rows, a heavy dressing of old well decayed manure being applied and at once dug in. This will induce a strong growth of roots, foliage, and crowns, and go far to insure a full crop of fruit next season.

WATERING FRUIT TREES.—To insure a full healthy development of branch, foliage, and fruit the trees must at no time be allowed to suffer by want of water. One thorough watering, followed by a mulching of litter, is better than half a dozen waterings without it. Keep the soil about the roots moist and the foliage clean, and there will be very little risk of loss from blight or disease of any kind.

FRUIT FORCING.

VINES.—*Lifting the Earliest Vines.*—No time should be lost in lifting and relaying the roots in fresh material, as success greatly depends on the formation of new roots before the leaves fall. Advantage should be taken of dull moist weather, and the Vines being carefully syringed and shaded, the roots will speedily take to the fresh compost, as is evidenced by the crisp appearance of the lateral growth soon afterwards, and when this takes place, and one or other of the borders having been left undisturbed, the ventilators may be thrown open with a view to harden and ripen the wood. Root-action should be assisted by an occasional syringing on fine evenings, and to allow the laterals to ramble until the middle of September, when growth should be checked by shortening preparatory to the autumn pruning.

Vines Cleared of Fruit.—Shorten all semi-extensions and lateral growths, carefully preserving the old leaves as the work is performed, and water thoroughly on fine evenings with water from the garden engine to cleanse from dust and insects. The house should be ventilated to the fullest extent day and night unless there is any doubt as to the ripeness of the wood, in which case it will be advisable to allow the temperature to rise by day to 80° or 85°, and rest the Vines at night by throwing the house open. Give sufficient water to inside borders to keep every part of the soil moist down to the drainage. The outside border should receive the annual top-dressing of loam and crushed bones whilst the leaves are on the Vines.

Young Vines for Early Forcing.—These will, from having made their growth early, have the wood firm and brown, and now or soon may be divested of all laterals as a means of inducing rest. Syringe occasionally to keep the old foliage clean and healthy, closing with dry sun heat every afternoon, and throw the ventilators open through the night.

Muscats Ripening.—The Vines will require more light and air; but in the event of red spider appearing, which is unusually troublesome this season, some of the main leaves being injured, a good spread of laterals should be left for protecting the shoulders of the bunches from the direct rays of the sun. The atmosphere should be kept warm, especially in the daytime, with free ventilation in the early part of the day, and enough at all times to insure a circulation constantly.

Late Vines.—Those of the thick-skinned keeping varieties as a rule require a long time to ripen with plenty of heat, which should be provided as far as possible by sun heat, commencing to increase the ventilation from the early part of the day, keeping the temperature through the day at 80° to 90° from sun heat, and allow the ventilators to remain open at night with, if necessary, a little warmth in the pipes to insure a circulation of air. If there is any fear of the borders becoming too dry a good watering should be given in the early part of a fine day, so that by free ventilation any superfluous moisture will be dried up before night.

Late Houses of Black Hamburgs.—The Grapes are swelling rapidly, and should have thorough supplies of liquid manure to both inside and outside borders, or good waterings through a mulching of manure. Do not allow the laterals to extend so as to crowd the principal foliage; at the same time allow a fair extension of the laterals as an incentive to root-action. Ventilate freely from the early part of the day, allow the

heat to rise to 80° to 85° and to 90° after closing, with plenty of atmospheric moisture, and before night admit a little air to allow of the escape of any moisture. No fire heat will be necessary unless the weather be unusually cold. Maintain a good moisture by sprinkling available surfaces at closing time and as necessitated by the weather.

Houses of Ripe Grapes.—Give abundance of air and keep the night temperature low, with sufficient fire heat to prevent the condensation of moisture on the berries. Damp the floors and paths on fine days—i.e., mornings. Black Grapes will be the better for a slight shade for a few hours when the sun is shining on houses that are not well filled with clean healthy foliage.

MELONS.—Late plants, which will now be setting their fruits, should, as soon as they begin to swell, have the fruit thinned to three or four to each plant, leaving, of course, the best situated and most even-shaped. Damping the plants and house morning and evening during bright days, and when the temperature is likely to fall below 70° at night fire heat should be employed to prevent it. Ventilate freely on all favourable occasions, and close about three o'clock with sun heat at 85°, and raise it to 90° with plenty of atmospheric moisture. Fire heat should be employed if necessary to maintain a day temperature of 70° to 75°. Let the plants when necessary have a good soaking of liquid manure, not too strong and in a tepid state, at the roots when the fruit is swelling, which will greatly assist their development. Keep the laterals closely pinched, not allowing them to interfere with the principal foliage, the foliage being kept so thin as to allow of the free access of light and air, thereby securing a proper elaboration of the sap, and consequently firm, heavy, well-flavoured fruit.

Plants growing in dung frames will need water sparingly either at the roots or overhead, as, the days getting shorter, there will be a consequent prolongation of atmospheric moisture. With the soil in a proper condition as to moisture very little will be needed after this, as the roots push into the fermenting material and there find a congenial moisture and a good supply of stimulating food. In ripening Melons in frames much depends on the sun heat; especially is this the case with late crops—therefore every opportunity that presents itself should be taken advantage of by closing early every afternoon, and on bright warm afternoons damp the plants lightly at closing time. In order to assist late plants in swelling their crops linings will be advantageous, and mats over the lights on cold nights.

PLANT HOUSES.

Selaginella denticulata (Kraussiana).—This is without doubt the best of all Mosses to grow for furnishing the surface soil of the various plants used for room-decoration during the winter months. It is useful for a variety of other purposes in arrangements that have to be made effective. To have it in good condition during winter it must be planted in shallow pans or boxes without delay. Hitherto we have found it most useful in pans a little more than 1 inch deep and about 7 or 8 inches in diameter; well-furnished plants in 2 and 3-inch pots are also serviceable. When established in shallow pans it can be lifted with the soil attached to the roots, and then lasts more than double the length of time that would be the case if established in a greater depth of soil, which would have to be removed from the roots before the plants could be used. If sprays are planted thickly in pans and started into growth in a close, moist, heated house or pit, they will quickly take to the new soil and become established. After this the growth will be firmer in a cool temperature, and will last better in rooms accordingly.

Panicum variegatum.—This is very useful for decoration in 3-inch pots, and to have these in the best possible condition for autumn and winter no time should be lost in inserting cuttings thickly. These strike best in a close frame shaded from the sun, and when once rooted may be grown in the stove or any warm moderately moist structure until they grow thickly and are well-furnished plants, when a slightly lower temperature will suit them.

Isolepis gracilis.—Decidedly the best of all green plants for fringing the conservatory or greenhouse stage during the winter months. To have plants luxuriant during that period a number should be divided without delay and placed in 3-inch pots in any moderately rich soil. After potting, the plants should be kept close for about a fortnight, then grown under cool conditions; plants so treated will be ready for use by the middle or end of October. When these plants crowd their pots with roots before autumn they not unfrequently turn yellow during the winter months, and present anything but an attractive appearance. When reported about this time they usually retain a beautiful healthy green appearance during the whole of the winter months. One or two applications of Standen's or other artificial manure during the winter assists them considerably.

Roman Hyacinths.—The bulbs are remarkably fine this year and cheaper than usual, which will allow of a greater quantity being grown to yield white fragrant flowers for cutting and other forms of decoration. No Hyacinths are more serviceable for cutting than these, and those who require a good supply of flowers should pot bulbs at once, and in batches at intervals of a month until the end of October. If this is done a constant supply of flowers may be maintained from the middle of October until the middle of March. For decoration in pots the bulbs should be placed five or six together in 5-inch pots; if for cutting, thickly together in pans and boxes. One crock will be ample at the base of the pots. A little sand should be placed at the base of the bulbs, and the compost for them should consist of good loam three parts, the other part being composed of leaf mould, decayed manure, and sand. The pots containing the bulbs should be placed outside without watering them, and covered 4 or 6 inches deep with ashes. They may remain in this position for at least

six weeks, when they should be examined, and if full of roots taken out, placed in a frame, and gradually exposed to light and air. Exposure must be gradual, or else the tips of the foliage will become browned.

Narcissus.—The early-flowering varieties, such as Paper White, double Roman, and single Jonquils, can now be obtained, and should be potted without delay. The two former may be placed in 6-inch pots, five or six bulbs in each, while the latter may be placed in the same size as Roman Hyacinths. If required only for cutting, the bulbs should be packed closely together in boxes. The bulbs should be treated exactly the same as recommended for Roman Hyacinths.

THE BEE-KEEPER.

USEFUL HINTS.

I HAVE always endeavoured to give a useful hint now and again in all articles, but in accordance with the wish of a number of readers, gladly avail myself of the opportunity to place these occasionally under the above heading. The great difficulty in giving useful hints is not so much to indicate what to do, but what not to do. This difficulty arises from persons assuming to what they are themselves ignorant of. The first hint I have for this month is to ask all bee-keepers to take nothing for granted, but test and prove everything before putting anything into general execution. By pursuing this course difficulties will disappear. The second hint is to note carefully under what system the bees collect most honey with the best finish. Harken not to, nor be led away by the report of somebody's bees gathering double or treble the quantity of yours. I am just in receipt of a letter from a clergyman who keeps bees to encourage his poorer brethren by giving information and supplying them with bees gratis. This year his hives have each of them given him 126 lbs. of fully finished sections and supers—the former his favourite—while my own hives, better bees than his, are short of that yield. From the reports I have previously had from that gentleman I am certain that had our bees been standing side by side mine would have had the heaviest yield. This is proved by the fact that in my immediate neighbourhood bees wrought on the same principle as that clergyman's have no surplus honey in supers. I repeat, there is no proof of which is the best system unless managed side by side.

I gave my experience last year of sections and supers, and showed the superiority of the latter over the former, determining then to discard sections altogether, which I did almost. One hive I pitched upon to further test that I was right in my conclusions. The one half of the top of this hive I covered with supers, the other half I covered with sections. The result is the same as my previous experience—the supers are filled, and not a bee has as yet entered a section. I have shown this hive to many bee-keepers, amongst them a bee-keeper from Derby and a reader of this Journal, who I know will support the truth of this statement. I am convinced the great majority of bee-keepers at the present day have no practical experience of supers. They employ appliances as they have been taught by others who did not possess the knowledge of both sides of the question; then they in turn teach others, and boast of the superiority of their system over that of which they possess no knowledge of. I have been as successful with sections as anyone could be, but I soon perceived they were a mistake. The fault is the broad bottom bar, with the space between the top of the hive and sections—repugnant or objectionable to the bees, who often prefer to swarm or cluster out instead of entering them, at the best losing time they do not lose when supers are employed.

I have already given an explanation of my divisional supers. I now give instructions how these may be employed in combination with sections, as some prefer these. But perhaps I had better explain a still simpler super for that purpose. The super proper, or I may say rack or crate for sections, serves all the three purposes, while it has the advantages of having the sections more compactly filled than any other way, and the bees do not object entering them,

while it is unnecessary to glaze, or otherwise pack for show or market, than the usual packing between combs, covering the tops with stout paper and lashing two together. When under the eye the whole crateful is seen at a glance, and comb never looks better than in the position the bees built it. Such a crate can have all its sections of one size, or if preferred of various weight.

The super is intended to be square, the front and back to be rebated, or better kept the thickness of top bar, narrower than the sides, which may have a pane of glass. The top bars should be $1\frac{1}{4}$ inch broad. Pieces of angled tin hold these down and close the openings between bars; two or three screw nails with washers beneath hold the whole rigid. The sections must be of the same breadth as top bars, and in three pieces only, minus the bottom bar, and for the purpose of allowing a thread to pass freely between top of hive and sections they should be a little shorter than the depth of case—less than one-eighth is sufficient. A staple, nail, or a small wedge should be employed at the bottom of the case to keep the ends of the sections in their proper place—in other words to preserve the $\frac{1}{4}$ -inch distance between the ends and case similar to a frame in a hive.

To fasten the section to the top bar, pieces of tin bent thus— hold them firm and close to the bar.

The broad side is uppermost, and a tacket or hobnail driven on one side of these preserves the required distance between the bars and prevents moving under any movement. One of these on the sections each side is sufficient, but should be an inch road. There are many ways of bending these, but a pair of square-mouthed plyers will serve most bee-keepers.

The Clover season is now past, and while many bee-keepers have a large field, many others, owing to the untoward early summer even in good districts, will have to be content with a moderate yield. There is already a large quantity of honeycomb in the market selling at a fair price. I have just been examining a large quantity of honeycomb in its different form of packages, supers, and sections by the hundred, the latter quite up to the mark for colour and quality; but, seemingly strange, not one of them up to the ideal standard of perfection we read so much about, which I easily understand. Obstinate creatures are these bees! During my peregrinations I visited many honey merchants, who displayed large windowfuls of honeycomb, none of it standing in its original position, all of it bleeding, and many of the combs detached from their bar, exposed to all the dust and perfume of its surroundings, while the flies were holding a rich banquet on its beady surface, much reduced in appearance and value than when it was in the hands of the careful bee-keeper. Many of the honey merchants whom I conversed with showed little inclination to buy more of the same packages, for indeed if people are as fastidious as I am they will hesitate before purchasing the finger-marked comb in sections which will have to be broken up and sold in small pieces. While the above was the tone of all I talked with, every one of them was prepared to purchase supers of from 3 to 6 lbs. in weight, because many people buy these for presents that would not otherwise purchase honeycomb—very congratulating to the ears of the introducer of small supers, and ought to be welcomed by all those who find a difficulty in bees entering sections and finding a market for the same. Surely this simple way of creating a market and teaching people to eat honey is a useful hint, and might have been first instead of third.

The fourth one is perhaps important too as teaching what not to do. Mr. G. Abbey as well as myself have touched on the topic of slaughtering bees; yet in the August number of the *British Bee Journal*, under the head of "Driven Bees," we find, "The bees should be carefully and quietly driven from the skeps, almost to a single bee, and the combs cut out clean and deposited indoors to prevent robbing, and the empty skeps returned to the garden to be cleaned by the bees." Such information coming from one who assumes to

teach the nation betrays his incapacity to do so, and naturally raises the question, Should the teacher and pupil in this case not be reversed? The following is the cottager's useful hint. It is a well-known fact to all cottagers who have kept bees any length of time that by exposing honey, empty combs, or syrup in even very small quantities irritates the bees to stinging for weeks after, incites them to robbing and seeking everywhere for more, losing themselves in thousands in houses and factories, killing each other in the hive in the conquest to win, and disabling every queen the strangers can lay hold of. In short, so fatal to bees is the above practice, that by exposing one ounce or less of honey whole apiaries may be entirely ruined, as has been already shown; yet such is the "useful" hint given by our contemporary. No wonder that such calamitous inventions are sought after as spreading of brood and late breeding, resulting alike fatally. The same *Journal* contains a drawing and explanation of a "mel pel," said to be newly invented and provisionally protected. I have not the number of the *Journal of Horticulture* beside me which to my memory contained a description of a similar machine, and from which many were made both here and elsewhere. Perhaps some of your readers will be able to give the extract. I think it appeared about fifteen years ago. Meanwhile, if any person has a desire to make such a machine they need have no fear they are infringing patent rights; besides, it is desirable to keep a watch that patents are not acquired for others' inventions.—A LANARKSHIRE BEE-KEEPER.

BEES DWINDLING IN A STEWARTON HIVE.

I SHOULD feel much obliged if the "Lanarkshire Bee-keeper" will give information on the following points:—I got a Stewarton hive last autumn, into which I put the bees from two straw hives, and fed it well. The numbers kept strong during the winter and spring, but dwindled quickly during the summer. The hive had two breeding boxes, which I reduced to one, and after a while not over a handful of bees were left in it, with the queen—a Ligurian, which was introduced in autumn. There was a good deal of sealed honey, but the lower part of the combs had no eggs or brood, and the pollen which was in it and the comb had a very foul unwholesome look. The floorboard, sides of hive, and moveable slips were black and damp-looking, and I think the loss of the bees must be owing to want of ventilation. Is this likely to be so? and will he kindly say how the hive should be covered both for summer and winter, and also how best to ventilate it? The hive itself has no provision for ventilation when all the slips are left in. I did this during the winter, and had over the hive a wooden cover, supplied by the maker, which overlaps the floorboard, and has a moveable, but close-fitting, lid, with no ventilation. Between the hive and cover I put a quantity of thick close woollen cloth, but none on the top.

Would it be an improvement to put ventilators on the top of the cover, and both for summer and winter to draw part or all of the slips on top breeding-box, covering with woollen material? What is the best system of ventilating?

I have now two Stewarton hives, which I think of keeping over the winter, and will be grateful for any hints as to their management. They and straw hives, with one bar-frame, I mean to take to the Heather this week.—A. R.

[From the description given by "A. R." I am inclined to think that when introducing the Ligurian queen in autumn the proper precautions had been omitted, and a young queen was raised, remaining unfertilised; hence the reason there was no brood. Much has been written in favour of introducing queens direct, and without the usual precautions that experienced bee-keepers found necessary, but the inexperienced say are unnecessary, because they may be successful with a chance queen. In all cases of introducing queens it is advisable to use every precaution necessary to insure success; without that failure is certain some time or other.

The hive seems to have been badly managed. Too much care had been taken to make the sides comfortable, while the all-important part, the crown or top, had been neglected. If the top of a hive is well covered with dry straw or meadow hay the covering of the sides may be dispensed with. When the crown of the hive is kept warm and dry the bees are able to dispel the vitiated air before it condenses on the top, sides, and floor of a hive. In a state of nature bees fasten their combs to the under side of overhanging rocks or shelves, protected from sun and rain; and though exposed at the sides they live and prosper in such a situation.

Top ventilation, though advisable if done so as not to create a draught, is of less importance than under ventilation. The close-fitting roof and top of a hive barely covered would bring about results as above described. There should be no difference between winter and summer's covering. Free ventilation around the hive at all times is absolutely necessary, while the top of the hive should never have less covering than 3 or 4 inches. Tolerably solid and dry hay, unless for supers, is preferable at all times to

woollen cloths, and but for the dust is better for these too. I recently described an efficient and cheap, though neat, cover for all kinds of hives. The useful hint regarding covering hives is to have them so covered that rain cannot touch any part, while the air circulates freely over every part of the hive or coverings. This attended to with a ventilating floor added, no hive will suffer from our severest winters or hottest summers. It would certainly be a great improvement to have the cover ventilated so as to dry up the moisture generated on the top during winter, and to keep the same cool in summer.

The ventilating floors are made with perforated zinc on the top, with a sliding bottom beneath, and at a distance between from 1 to 2 inches. For taking bees to the Heather safely ventilation both above and below is advisable. With paper and cork packed between the combs, which requires to be removed at the Heather, where the bees rushing out on a strong site would probably never reach their own hive, while robbing, stinging, and queenless hives would be the result.—A LANARKSHIRE BEE-KEEPER.]

TRADE CATALOGUES RECEIVED.

Dammann & Co., Naples.—*Illustrated List of Vegetables and Flowers.*
Ant. Roozen & Son, Overveen, Haarlem.—*Catalogue of Dutch Bulbs.*
W. Baylor Hartland, Temple Hill, Cork.—*Little Book of Daffodils (illustrated).*
L. Späth, Berlin.—*Catalogue of Bulbs.*
Waite, Nash & Co., 79, Southwark Street, London.—*Wholesale Catalogue of Flower Roots.*
George Buyard & Co., The Old Nurseries, Maidstone.—*Catalogue of Hyacinths and Dutch Bulbs.*

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Souvenir de la Malmaison Carnation (Clarke & Co.).—We think your pink sport from the above variety dissimilar from others we have seen, and very good indeed. It is large, fragrant, and pleasing in colour.

Hautbois Strawberry (H. W.).—The Strawberry leaves were quite withered and the fruit crushed. It is one of the Hautbois varieties, the peculiar flavour of which is much enjoyed by many palates. The plants are of easy culture. The flower was withered beyond the possibility of identification. We have received many shrivelled specimens this summer that no one could name.

Fruit Trees for Manitoba (C. A. C.).—We have no data whatever to guide us in selecting Apples and Pears for the purpose indicated. The best thing you can do is to state your requirements to some extensive grower of fruit trees, as most large nurserymen send consignments to America yearly, and no one knows better than they do the best varieties, time to send trees, and the best method of packing them to reach their destination safely and at a suitable time for planting.

Gloxinia Leaves Rusted (S. W. L.).—The drying and curling of the leaves both of Gloxinias and Achimenes is generally caused by too much sun and a dry atmosphere. They cannot be grown well except in a somewhat humid atmosphere, and the pots should always stand on a moist base in summer, and the plants be shaded from bright sun, and they should not be exposed to sharp currents of dry air. With suitable atmospheric conditions and active root-action, in good soil, plants raised from healthy tubers are sure to flourish. Thrips often infest the plants in a dry atmosphere, and in that case there can be no healthy growth.

Insects on Chrysanthemum (J. L.).—We gladly do our best to answer your queries, but are certainly surprised that a gardener of your experience should have enclosed specimens in a slip of paper placed within an ordinary letter. The insects should have been put in a box which would bear pressure, and it would have also been better to have sent each species apart. Your leaping insect, which we may call No. 1, is the frog-hopper (*Aphrophora spumaria*), the mature stage of the too common "cuckoo spit," which appears on many plants in May and June. It is certainly desirable to kill this insect whenever it can be caught. The more quiescent (No. 2) is the larva or grub of a ladybird or coccinella, therefore deserving of encouragement. No. 3 seems to be a small beetle of some kind, too damaged for recognition. It may be injurious, but small holes in the buds of Chrysanthemums are occasionally caused by earwigs.

Croton Leaves Falling (Town Gardener).—When we examined the leaves, before reading your letter, we arrived at the conclusion that gas or some deleterious fumes had found entrance to the house. We observe that you have been damping the house with liquid manure. We have not a doubt that if the liquid is strong the ammonia arising therefrom has caused the injury, particularly as the sun has been bright of late, and houses suitable for Crotons cannot be ventilated so early and freely as vineries can. We have seen Vines injured in the same way that your Crotons are when strong liquid manure has been used for damping, the house closed all night and the lights not opened very early in the morning. With a proper system of ventilation Vines are benefited by impregnating the air with ammonia after the foliage gets firm and the Grapes are swelling after stoning.

Caterpillars on Vines (E. D. C.).—Your Vines, we regret to say, are attacked by a very destructive insect, a species of *Tortrix*, which is fortunately not very prevalent in this country. We are quite familiar with this Vine scourge, having seen an example of its destructiveness in a very fine house of Grapes in Lincolnshire, and it was only banished by the most sedulous attention of the gardener in destroying every moth, chrysalis, and caterpillar he could find. By shaking the bunches the latter fall by a web, and many of them may be caught; also by fumigating a vinery moderately and shaking the Vines the moths are disturbed and succumb to the fumes. It is very important that the house and Vines be thoroughly cleansed in the winter, every portion, Vines, walls, woodwork being washed, and, if the border is inside, removing the surface soil down to the roots and adding fresh. Any plants in the house should be similarly cleansed and top-dressed. If this work is well done the pest may possibly be eradicated, or nearly so, and by prompt action next year in destroying the first moths the house may be cleared of this highly destructive pest. Can you oblige us with more specimens so packed that the Grapes do not crush the moths, as was the case with those you sent?

Cucumbers Failing—Cœlogyne (Trike).—We cannot account for the failure of your Cucumbers unless the soil is too rich or the leaves imperfect, so that the sap is not elaborated and assimilated. Are you sure there is no disease—tubercles on the roots? Place the Cœlogyne in a rather shaded position in a cool stove; or if it has made its growth it will be quite right in a vinery, but not in a position where it will be exposed to a dry current of air. It may be sprinkled daily and the roots kept moist, but not saturated, a sour medium being ruinous to Orchids. If you possess back numbers of the Journal and consult the indexes you will find the culture of this useful and easily grown Orchid described.

Mealy Bug on Vines (Y. Z.).—There is no ready method of clearing mealy bug from Vines when it has been permitted to become established in the bunches. Methylated spirits applied with a small brush will destroy the insects. The leaves should be gathered from the Vines after they have turned yellow in the autumn and burned. This is far better than allowing them to fall and thus scattering thousands of insects in the house. Pruning should be done early, the rods washed and dressed with tar and clay mixture, every part of the woodwork and walls washed, and plants cleansed as suggested to another correspondent in clearing his house of another Vine pest. It depends on the thoroughness on which the cleansing is done as to whether the Vines are seriously attacked next year or not.

Painting Stage in Vinery (A. B.).—After the Grapes are ripe you may safely have the stage painted, as the foliage of the Vines will not be so readily injured as when in a young state; indeed no injury will ensue either to the Grapes or the foliage providing you ventilate freely by the top and front lights day and night, so as to secure a free circulation of air. The best Grape of the two you name for exhibition at the end of August would be *Alnwick Seedling*, which, when well represented, is a very telling variety, but the other is very good, yet not in season until a later period. Better than either for the time named is *Madresfield Court*, as a rule, judging by the successful examples staged at the leading shows.

Applying Liquid Manure to Roses (Mechanic).—As you wish to avoid diluting with water, the liquid should be applied just after or along with rain, or it may be applied at other times without injury, only keep at a distance of, say, a foot from the stem. Be careful, however, not to apply it in very dry weather, as there is not only great waste in so doing, but the hungry roots will lay hold of it, and even if they are not injured, the manure will have an injurious effect upon the plants, hence we advise its being used only when the soil is moist. It may also be applied in early winter and spring as a means of enriching the soil. We should not use any disinfectant, as there will not be much smell, or only whilst applying (which should be done at night), the soil being the best of all deodorisers, but you may put on a sprinkling of dry soil after each application, so as to absorb any matter remaining on the surface, an inch thick being sufficient.

Crimson Galande Peach (W. H. Divers).—The fruits you have sent are well-grown examples of the above well-coloured and richly flavoured variety, and we are not at all surprised to hear it is a favourite of such a good judge of fruit as Mr. Hopwood is. This Peach is described as follows in Hogg's "Fruit Manual":—"Fruit large, roundish, and rather uneven in its outline, marked with a very faint suture, and pitted at the apex. Skin almost entirely covered with very dark crimson, nearly black. The little on the shaded side that is not coloured is a pale yellow. Flesh very tender and melting, very much and deeply stained with blood-red at the stone, from which it separates freely. Juice very abundant, rich, sprightly, and deliciously flavoured. Flowers small. Leaves with round glands. This is a very distinct and very excellent Peach, and ripens from the middle to the end of August. The tree is a remarkably free grower, and an abundant bearer. It was raised by Mr. Rivers of Sawbridgeworth from *Belle Bance*; but it is a much better grower than that variety."

Chrysanthemum House (Cambridge).—The section you have sent represents a very good house. The only improvement we can suggest is, that four rows of plants on each side would be much more convenient for watering, as the middle row would be difficult to reach from either side, and the plants would be much less likely to lose their foliage from mildew through overcrowding, but if they are tall and clean-stemmed these objections would fall. It is not a good plan to sink the pots down below the ground level. The flowers of Chrysanthemums never finish better than when the

light and air can play well round the pots, and we should make plenty of provision for admitting air at the side for the wind to blow well around the pots on all fine days. The front rows might be plunged about half the depth of the pots. You would thus gain 6 inches in height, in a better way than raising the eaves of the house which might cause drip, and if the path were raised (unless by joists and laths) there would be the same objection—viz., obstruction of the air among the pots. If the height of the plants permit we would raise the two back rows on planks or inverted flower pots to give the proper slope to the bank of flowers. These suggestions are founded on the supposition that the chief aim is to produce well-finished cut blooms for exhibition, the display as a whole being a secondary consideration. A boiler and pipes would be the best method of heating.

Red and White Roses (A Lady Gardener).—You give no idea of the number you require nor of the size of the beds you desire to form and plant. The following are good bright red or crimson Roses:—A. K. Williams, Alfred Colomb, Duke of Edinburgh, Marie Rady, Dr. Andry, Le Havre, Mrs. Charles Wood, Général Jacqueminot, Ferdinand de Lesseps, Prince Arthur, Duke of Teck, Exposition de Brie, Maurice Bernardin, John Stuart Mill, Sir Garnet Wolseley, Thomas Mills, Annie Wood, Madame Ducher, Crimson Bedder, John Bright, Horace Vernet, Lord Macaulay, Duke of Connaught, and Fisher Holmes. Possibly those may suffice. White Roses are much less numerous. Suitable for beds are Baronne de Maynard, Boule de Neige, Coquette des Blancs, François Petit, Louise Darzens, Mabel Morrison, Madame Lacharme, Madame Plantier, White Baroness, Merveille de Lyon, Souvenir de Malmaison, with Niphetos, Alba Rosea, Madame Bravy, and other Tea Roses. The miniature Roses Anna Maria de Montravel and Parquerette are suitable for beds. All the varieties named are not pure white, but some that are not are better than others that are for the purpose indicated. Gloire de Dijon grows well as a standard in most districts, forming a large head, and we have seen Maréchal Niel grown very well in the same way in favourable positions. Rose beds cannot be too plain in outline. We publish a plan of a Rose garden in another column, but it may be too large for your purpose. We have smaller plans, and if we had an idea of the extent of your ground might perhaps insert one if we thought it would be useful to do so.

The Rochford Boiler (W.).—This horizontal tubular boiler is sold by the Thames Bank Iron Company, and is advertised in another column. It is a favourite boiler with many extensive growers of fruit and flowers for sale, but some of them have perhaps erred by having the pipes too long owing to the contraction in cooling. The firm in question may be relied on to give

Fig. 27.

sound advice on the subject on which you desire information. As we have received several inquiries for particulars about the boiler from time to time, we insert a figure which clearly shows the nature of the apparatus.

Names of Fruit (F. J. R.).—Your Apple is Irish Peach.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should contain spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once. (G. W. L.)—1, *Tecoma radicans*; 2, *Achillea Ptarmica* fl. pl.; 3, *Rhodanthe Manglesi*. (W. J. C.)—1, *Galega orientalis albus*; 2, *Astrantia minor*; 3, *Campanula carpatica alba*; 4, *Spiraea Ulmaria* fl. pl.; 5, *Tradescantia virginica*; 6, *Calceolaria cbelidonoides*. (C. Thomas, *Aberdare*).—1, *Hyophrorbe indica*; 2, *Dicksonia squarrosa*; 3, *Begonia debilis*; 4, *B. Dregei*; 5, *B. metallica*; 6, *Caladium*—we do not name garden forms. (M. H. S.).—The white-and-purple flower is *Chrysanthemum coronarium*; the yellow one is apparently a poor form of *Rudbeckia Newmanni*; the other is probably *Cynanchium acutum*, but the specimens were not sufficient to determine them with accuracy. (U. R.).—1, *Epipactis palustris*; 2, *Asplenium Adiantum-nigrum*; 3, *A. Tricomanes*; 4, *A. ruta-muraria*. It is a pleasure to name such specimens—the best we have had sent.

Supers on Stewarton Hive (E. A.).—If the under snpers are finished, which should be easily ascertained by looking in at the windows provided at the front and back of these supers, all that are filled or partly filled should be removed, as Heather honey is a special article and should be always free from an admixture of other sorts. The under ones removed, and the upper containing comb only, might with great advantage take their place. There is a limit to tiering as well as other ways of management; consequently, it might have been more to your advantage had the fifth super been withheld and those first put on removed instead. This is a course, however, that can only be determined on the spot.

COVENT GARDEN MARKET.—AUGUST 12TH.

HEAVY supplies have been reaching us, but the bulk has been gathered and prices have improved, also large quantities of Grapes and Tomatoes from Channel Islands.

THE CLERGYMAN'S FARM.

(Continued from page 126.)

POTATOES, Carrots, Mangolds may be mentioned as the three indispensable root crops to be grown on the glebe land, and to them we may add White Turnips and Swedes, as occasion may serve. Second early and late sorts of Potato should be grown in view of affording a supply for the household, and an abundant surplus for cooking for pigs and poultry. Early Rose, Snowflake, Magnum Bonum, and Scotch Champion are safe sorts to plant extensively. New sorts come crowding upon us by hundreds, but we seldom find any of them becoming such general favourites as those which we have mentioned. The chief points requiring close attention in Potato culture are the selection of sound seed tubers of fair size, which must not be suffered to become exhausted by premature sprouting before the planting, but should be laid out thinly in trays in a frost-proof building, and with sufficient exposure to light and air to insure a very gradual growth of sturdy green sprouts as thick as one's little finger. The trays should be portable, so that the tubers may be taken to the field with care, and the planting done without injury to the sprouts. An ample reward for our pains and care is found in the quick, certain, and robust growth which we invariably have from seed so prepared. No failures, no weakly growth have we, and the tubers are so safe from exhaustion upon the trays that we can wait for the planting till the soil is in a suitable condition. Ploughing and cleaning early in autumn, a heavy dressing of artificial manure in spring, ploughing if necessary, stirring with a cultivator or horse hoes, rolling, harrowing to get a fine tilth for the planting, hand and horse-hoeing as Potatoes and weeds make growth, and moulding with the double-breasted plough before the roots have spread far into the soil.

Both Carrot and Mangold seed should be sown by the middle of April. The great difference now visible in the appearance of the crops upon different farms is, in many instances, owing to the time of sowing more than to other details of culture. Sow Mangolds in rich well-worked soil the second week of April, and you may have a few roots bolting to seed, but the bulk of the crop will be heavy and excellent. Of sorts take either Long Red or the best Yellow Globe Mangold. For our own crop we prefer Long Red, having regard to its beneficial effect upon the dairy cows in winter and to the weight obtained per acre, which exceeds that of any other sorts we have tried. It is wise always to

devote more land to the culture of Mangolds than to Swedes—Mangolds being a sure crop, but Swedes are very uncertain, and by a system of pulping and mixing with chaff Mangolds may be rendered excellent food throughout winter. Carrots are highly valuable in winter for horses, cows, lean stock, and sheep, and we regret not finding their culture more common than it is. For light thin soil Red Intermediate answers best, and for deep rich soil Long Red is preferable. The soil should be fertile for this crop, the seed sown in drills early in April, singling done as soon as the plants are large enough, and the hand hoes should follow quickly, for if weeds crowd the young plants they are apt to become drawn and weak. Nothing can be more simple than the culture of this root, and it certainly well repays us for it.

May for the north, June for the south, are the months for sowing Swedes. White Turnips may also be sown then and in the two following months for a late supply, a late crop of Turnips being very useful in spring for store sheep, and it is often obtained by sowing after Winter Oats. In hot dry weather the Turnip fly does much harm; but with a fine seed bed, soil highly manured, and new seed, we may usually avoid much harm from it, and by way of precaution we generally sow about 2 lbs. per acre of White Mustard with it, the quick germination and growth of the Mustard bringing it on for the fly before the Turnip plant can suffer.

Assuming that the clergyman's farm will always have a fair proportion of live stock upon it, including horses, cows, store cattle, sheep, and pigs, the value of an ample store of roots in winter and spring is self-evident. A change of diet is good at all times, but it is especially so in winter when, with the exception of sheep, all animals are confined in yards and sheds. In November Carrots come into regular use for the dairy cows and horses, and there should be enough Carrots for the horses till spring. For the cows sliced, not pulped, Carrots are best, mixed with bran; this, with plenty of the best meadow hay, forms an excellent winter dietary for strong healthy cows. For a change that is both wholesome and nutritious, Drumhead Cabbage and later on sliced Mangolds and Thousand-headed Kale are used; but Turnips are not given to dairy cows at any time. For store cattle an occasional meal of Turnips is a wholesome change, especially in November and December, after which time preference is given to Mangolds. Let us take especial care that our store of both Carrots and Mangolds is a large one. It is by the end of February that we have the full value of such provision impressed upon us. Store cattle kept till then upon hay and straw only become mangy. A regular supply of roots corrects this, and what a help to the hayricks as well as to the animals are plenty of Mangolds then! For the breeding flock they are invaluable, only do not let them be given wastefully. A daily supply of fresh roots should be taken to the fold or pasture, and the quantity strictly regulated by the consumption. Sows and store pigs eat them greedily, and so fond are horses of them that in the eastern counties they are used instead of Carrots. Poultry, too, are very fond of them. It is really surprising to see how soon two or three old hens will consume a huge root of the Mammoth Long Red, and we take care to let them have as many as they can eat. For poultry confined in wired enclosures a root or two given frequently would prove highly beneficial. The roots are not sliced for poultry, but thrown to them uncut, and they soon peck them up.

(To be continued.)

WORK ON THE HOME FARM.

Corn harvest, though somewhat retarded, is now upon us, and on the whole it is an abundant one. As is invariably the case, good farming proves to be the best farming—best in the important sense of full crops upon land highly cultivated. It will, however, be well to consider what, under the present adverse circumstances, we ought to regard as the profitable limit of high cultivation. Results are before us. How have they been obtained? It is only by careful thought, by an intelligent grasp of facts, and by careful comparisons made constantly week by week, and especially now, that we can hope to master fully every lesson affecting our calling

that is worth learning. How to get our harvest work done economically has been a weighty matter. Hornsby's reaping and binding machines are on hire at 4s. an acre. This fact, doubtless, had weight with Norfolk farmers when they decided to "hire the harvest" to the labourers at £7 instead of £8. This amount is supposed, and in point of fact does, closely represent a payment of about 11s. an acre for reaping, binding, and stacking the crops. But an average sum cannot be a fair one, for the farmer with a light corn crop must demur at being compelled to pay as much per acre as another with a heavy one. The question we have now to decide is the comparative cost of a reaper and binder at 4s. an acre, with the addition of 2s. for string, and the cost of stacking, with the old system, and if only a saving of 2s. an acre is effected by the use of improved machinery it must be done. It is idle to talk of harsh treatment of the labourers. A revolution in farming is upon us, and we must either resolve to turn its stern lessons to account or be overwhelmed by it.

The roofs and sides of some dilapidated old barns have been repaired in readiness for the harvest, and all the woodwork has had a dressing of tar. Negligence of outbuildings is a common fault, yet there never was a more expensive one, prompt attention to patching and tarring old buildings saving many a pound. If Peas can be brought to the rickyard sufficiently forward for threshing, it will be done at once. Our statement as to the comparative value of winter and spring Beans proves somewhat unsound, for since writing it we have seen several fields of spring Beans badly attacked by aphides, one field so seriously that the crop is worthless. Winter Beans, on the contrary, are in many fields so good a crop that they will prove very profitable, and the outcry about the failure of winter Beans was certainly a little premature. All our new hayricks have been insured. Land under spring Tares, wherever it has been folded with sheep, has been ploughed as the Tares were used. It will be turned to account at once for White Turnips, or it will be sowed in September for Rye for an early supply of green food next year. White Mustard is being ploughed in as fast as it becomes fully grown, or, rather, when it is in full bloom.

OUR LETTER BOX.

Ear-Cockle in Wheat (Sussex).—Purples or ear-cockle is generally brought into a Wheat field by the galls containing the dense cottony mass of worms being mixed with the seed corn. The gall is really the diseased grain so altered that instead of the germ and store of starch it contains a mass of minute worms. Ripened with the corn at harvest time, so long as the galls remain dry the worms remain torpid, and it has been proved that they retain vitality for a long time, and Professor Carruthers has shown how when the gall becomes moistened with water the worms become active, they penetrate the wall of the gall and escape. Even after they have left the gall they may be dried up and become torpid, and remain in this condition for a considerable time without being killed, for when moisture is applied to them they revive again. You say that of two fields of Wheat sown with one lot of seed one has no cockle and the other is badly affected. We can only suggest that by some accident the galls had been mixed with part of the seed, or else thrown among manure used in the field containing the affected Wheat.

Prickly Comfrey (W. S.).—In November the plants may be divided into as many pieces as there are crowns, reserving a portion of root to each division, planting in rows 30 to 36 inches asunder, and 24 to 30 inches apart, burying up to the crown in loose soil. The ground should have been deeply trenched, and the more manure is worked-in the better the plants will flourish. A good dressing of manure should be given about the crowns after planting, and this should be pointed-in early in spring. The deeper and richer the soil the more space should be given the plants. Comfrey does best in deep damp soil, but the moisture must not be stagnant. Propagation is also effected by cutting the roots into lengths of about a couple of inches, and dibbling them in at the above-named distance, apart, November and February being suitable seasons. Guano, nitrate of soda, and salt are good surface dressings, applying in March.

REMARKS.

2nd.—Cloudy, but fine.
3rd.—Fair, cool, and cloudy.
4th.—Bright early, then cloudy, with a few drops of rain at 5 P.M.
5th.—Morning damp and misty; afternoon and evening fine.
6th.—Fine morning, then dull, slight rain at 3.30 P.M., thunder at 4 P.M., and occasionally later.
7th.—Fine early; slight thunderstorm with hail at 11 A.M.; afternoon and evening fine.
8th.—Cloudy morning, but very fine afterwards.
Temperature considerably below that of previous weeks, and very near the average. Thunder storms have prevailed in the neighbourhood, but the rainfall here has at present been quite insignificant.—G. J. SIMONS.

ROMAN HYACINTHS.

FOR early flowering there are no Hyacinths to equal these. They are the only ones which can really be depended on to flower freely throughout the very dull months of November and December, and their culture is so easy that all who possess a greenhouse, no matter how small, should grow them. Their price this year is less than usual, and the bulbs are equally good. This should be an additional inducement for amateurs and every garden owner to grow them extensively, and the absolute certainty of their giving satisfaction may be relied on. The strongest bulbs generally produce from two to four spikes, and the poorest never fail to flower. The blossoms are as white as snow, and they are deliciously fragrant. We would as soon think of being without Camellias or Chrysanthemums in autumn as Roman Hyacinths. They are invaluable for conservatory decoration, and they are charming in a cut state. Altogether they are the most useful Hyacinths anyone can possess.

To insure their flowering early in November they ought to be potted now, and to have them in constant succession during the winter a few dozens, or a few hundreds, should be potted every three or four weeks. We generally put them in in lots of from fifty to 100 from the middle of August until January, and have them in bloom from November until March. The best soil to employ is a mixture of good loam two parts, sand one part, and half-decayed manure one part. The pots should be efficiently drained. From 3-inch to 6-inch pots are good sizes to use. Three bulbs may be put into a 3-inch pot, and from five to six bulbs into a 6-inch pot. When potted the crowns should just be seen above the surface of the soil. The soil should be made firm and smooth, and it must be moderately moist before potting, as we find the bulbs succeed best when not watered immediately after potting.

As soon as potting has been finished the whole of them should be plunged under 6 inches of ashes or cocoa-nut fibre, and it does not matter much whether this is done in a shed, frame, cellar, or in the open against the wall in a sheltered place. As we have plenty of empty frames in the autumn, we generally place them in one of these as closely as they will stand to each other, and cover them when the batch has been completed. In rainy weather the lights are placed over them. About four weeks after plunging the covering should be removed carefully, and it will then be seen that the bulbs have formed strong growths from 1 inch to 2 inches high. The pots, too, will be well filled with roots, and they are then ready for taking into a frame or house to grow on for flowering, which they will quickly do in a temperature of 65°.

It is by repeating this practice that a succession of them can easily be maintained, and those unacquainted with their culture will be astonished at their own success the first season they take them in hand. At times we have put large batches under cover and brought them all out together, and

a number were put in a cold frame to keep them behind those which were put into heat. Where the supply of cut flowers is the only object in growing them, pots may be dispensed with, and large numbers may be put into shallow boxes, but they must all be buried until they form roots, and have plenty of light and a little heat to bring them into flower.—M.

MUSHROOMS.

Success in the cultivation of these much-esteemed edibles depends in the first place upon the spawn, it being absolutely indispensable to have it of the very best description in an active state, and such being the case it is well to test its quality when it comes to hand by making up a small bed or a box so that it may with safety be used for spawning a large bed, from which the supplies are to be drawn for a considerable time. If this were done much disappointment would be avoided, as there is nothing so aggravating as to make up a bed and after waiting weeks or months find that it is merely a waste of material, time, and labour. When the spawn is received it should be stored where it will keep well. To insure this you must select a moderately dry place, with a temperature of about 50°, packing it close together until it is wanted for use, when it will have to be broken into pieces about 2 inches in diameter, and only those pieces which contain spawn in a proper state should be used in the beds. If the spawn were given this scrutiny and treatment failures would be avoided to a very great extent; indeed I am persuaded that more failures in Mushroom growing are attributable to using spawn in an inert or spent condition than to any other cause. The spawn may have been too highly developed in the bricks and is simply spent; instead of being a mass of small threads, the threads are as large as fine cotton, and the white mouldiness almost absent. It is of no use at all in that state, as it contains no active germs to develop as mycelium. Spawn also spoiled after being received through being kept too moist and too warm so as to cause the development of the mycelium, consequently it is spent in the bricks before it is inserted in the beds; therefore it should be kept dry and cool, yet safe from frost, though frost is not injurious when the spawn is dry. It is also a bad plan to have spawn for a long time in stock. I find it is best fresh, therefore a supply ought only to be purchased sufficient for the season, and it ought to be of the current year's make—securing it early in August.

Mushrooms are a natural crop in August and September, varied by being earlier and later in pastures or places where cattle have been kept; and as the supply at the usual Mushroom season is generally adequate for ordinary requirements we may pass over that period, and face the fact that for the remainder of the year the supply is produced by cultivation. The cultivation of Mushrooms has of late years been considerably simplified, which is in a great measure due to the impetus given by the timely appearance of "Mushrooms for the Million." The alteration more particularly applies to the means and preparation of the materials. Formerly much time and trouble were expended on the material in order to get it into a proper condition—to prolong the heat in a subdued form, which as a matter of course from the frequent turnings and consequent fermentations caused its exhaustion by the time it was considered fit to make up into the beds. This practice has been dispensed with in a great measure by many growers; they use the manure in a fresher state than formerly, indeed I like it direct from the dung-yard or midden, which has been allowed to accumulate from the stables for a fortnight or three weeks. This is cleared of all the long straw; a fork will remove all that is necessary, and it leaves the droppings with quite as much short straw, and being somewhat light or springy a little fresh turfy loam broken up roughly added gives it solidity, and insures it being formed into a firm mass, besides preventing overheating and drying. Thrown in a heap for two or three days it will heat, and should be

put in the beds 18 inches deep. When the heat is sufficient, or in about three days, it should be trodden or beaten down firmly, adding more if necessary to make it of the requisite depth or 18 inches, and a thermometer with the bulb 3 inches beneath the surface will indicate the temperature. If it rise above 90°, as it will in a week, wait until it recedes to 90°, and then insert the spawn 9 inches apart, first beneath the surface, beating down so as to firm the spawn well in the material. In the course of a week or ten days the bed should be earthed, but if the heat declines rapidly it may be earthed soon after, or at the time of inserting the spawn. I put on the soil 3 inches thick in the loose state, which when well beaten down is not more than 1½ to 2 inches in thickness, good turfy loam being used in a moderately moist state so as to form a compact mass. If dry it must be moistened so as to insure its being firm, making the surface smooth with the back of a spade. To prevent it becoming dry and cracking a layer of hay may be placed on the surface about 6 inches thick, and allowed to remain until the Mushrooms appear, as they will in from six to eight weeks from the time of spawning, though I have had them in a month from spawning, but such is not usual, when the hay must be removed altogether. The soil should be kept uniformly moist, avoiding overwatering or its opposite extreme. It is hardly necessary to state that the house should be thoroughly cleansed, every means being taken to destroy woodlice, slugs, &c., which will save much after-trouble.

In order to have a supply of Mushrooms by the time the outdoor supplies are over a bed should be made ready for spawning early in September, and successional beds will need to be made at intervals of a month or six weeks according to the means and requirements of the establishment. A temperature of 50° is suitable for Mushrooms, and the nearer it is kept between that and 55° the more fleshy will be the Mushrooms and the more readily will they be produced.—G. ABBEY.

THE TEACHINGS OF THE DROUGHT.

THE notes by your correspondent, "B.," on the "Teachings of the Drought" during this exceptional period of dryness will be read by observant practitioners with more than ordinary interest, as there are two or three points mentioned therein which should engage our careful and serious attention. It is not in seasons of drought alone that useful lessons are to be learned on the gradually increasing problems of gardening, but also in cold and wet ones. Of the latter we have, however, had abundant experience, and such has already had its due share of discussion; but such a long period of drought as we have experienced this year has not occurred within the last decade or two, and thus we have not had opportunities of making the necessary comparisons between the value of methods of cultivation and quality of crops in dry and wet seasons.

It is more necessary now than it has ever been that gardeners should be able to cope with the difficulties and disadvantages of a dry season, as every year our climate becomes more susceptible to variability, and therefore the difficulty will assume a greater magnitude as years roll on. The quality of vegetable crops, methods of tillage, and value of manures in such a dry season as this are subjects which your correspondent has wisely directed attention to as being worthy of more than a passing consideration. Our experience exactly coincides with that of your correspondent respecting the value of deeply trenched ground in this as in other seasons, and we are sure it will be generally admitted by the most advanced of the anti-trenching advocates that deep cultivation has been of the utmost service in sustaining the growth of vegetables, as well as fruit and flowers, in a marked degree.

It is not in one district alone that we have noted the good effects of a deep tilth, but in various parts of the country also. With ourselves deep trenching is of the utmost value, as owing to a somewhat hungry and gravelly subsoil our vegetable crops would prove a failure in such a droughty season as the present. The vegetable garden under our charge had never, previous to our undertaking its management, been trenched to any great extent, consequently it was only in one or two positions that root crops especially would grow satisfactorily. Observing the nature of the soil, which was exceedingly rich in humus, we

determined to improve and render the whole of it by degrees suitable for the general growth of vegetables. To trench it three spades deep, unless set about systematically, would do more mischief than gain good by turning up the sour subsoil which for years had received the drainage of a liberally manured soil. What was to be done, then, under the circumstances? as it certainly would not do to remove one evil to create a greater. The course we decided upon was this: to trench two spits deep, and with a fork break up the bottom of the trench to the depth of another foot. Over this broken surface the top spit was thrown, then a good layer of manure, and on the top of this the second spit was laid; thus a portion of the subsoil was actually brought up to the surface. The soil was rich in humus and insect life too. The application of lime had not been thought of during the many years of my predecessor's management, consequently it was necessary to give the trenched ground a liberal dressing to sweeten the new soil and in its descent decompose the humus in the new subsoil, which at the next trenching would again come to the surface rich in salts previously locked up in the humus, but now liberated by the action of the lime. We did not apply the lime before trenching, as had we done so we should not have benefited so greatly by its application, as owing to its tendency to sink rapidly its virtues would have descended too far to be of use to us. We preferred to spread it over the ground after it had been trenched and then lightly forked it in some time previous to sowing or planting.

To counteract the evil of planting or sowing the first year in the late subsoil before it had had sufficient exposure to the air, &c., to render it sweet and fertile, we had the drills for seeds drawn wide and deep, and in these previous to sowing we had a portion of wood ashes and old potting soil spread along the bottoms. Then the seeds were sown and finally covered with the same compost. Of course we could only do a portion of the garden each year, but what was done was done well, and we had and have the satisfaction of having excellent crops of vegetables where those of very inferior merit only had been grown in previous years. It was surprising how well roots did on the trenched land. The wood ashes and soil spread in the drills sustained the growth of the seedlings until their tap roots began to descend to the under stratum of manure and rich soil in the bottom. This season, through unforeseen circumstances, we could not get enough ground trenched for the whole of our Carrot crop, consequently a portion had to be sown on trenched and the remainder on dug ground. The two portions will tell their own tale. The trenched portion in spite of the drought is supporting a free and healthy growth with fine roots, whilst the untrenched are stunted roots with withered foliage. Onions, too, on a piece of trenched ground have very fine bulbs, and on digging down a spit deep to-day we found the roots descending below that depth.

The above is conclusive evidence that deep trenching is specially valuable in droughty seasons like the present one. It is also of unquestionable value in Strawberry culture. Quite recently we saw a plantation of Dr. Hogg, one year old, each plant averaging 24 inches in diameter, and these growing in ground which had been trenched 3 feet deep previous to planting. We have great faith in the efficacy of lime applied annually in moderate quantity over the soil of old gardens, providing farmyard manure is used in due proportion too. We have found lime of special value both in its carbonate and phosphate forms for growing the various members of the Brassica family, as it is a sure preventive of that troublesome disease the club. For years past it was deemed next to useless to grow Brussels Sprouts, Savoys, or Broccoli, as they were sure to be attacked with club. Two years ago we took in some pasture land to make an addition to our vegetable quarters. A portion was dressed with lime and a portion undressed. Now the Sprouts in the first-named are quite free from club, whilst those in the undressed are badly attacked by it.

Farmyard manure is the best all-round manure we can employ for the vegetable gardens, and, as your able correspondent says, it certainly supersedes the various types of artificials in dry seasons. Peas have been grand where abundance of it was trenched in, as the roots soon descended in search of it, and thus enabled the main and later crops to defy the drought. Farmyard manure is not, however, always as good as it might be. It is very often too deficient in the essential fertilising properties, but this need not be so in the majority of cases. A little outlay in having suitable tanks built for the reception of urine and the washings of stables would be of immense value, as then the valuable liquid could be emptied over the bulk of manure, which with frequent turnings would render it a grand fertilising material. Mulching has been of great service to us on our light gravelly soil as far as we could carry it out, but unfortunately it is not every gardener who can command manure for the two

purposes. Where there is a deficiency of the latter, recourse can be had with great advantage to the mowings of the lawn, which will answer admirably for mulching Onions and other crops likely to suffer much from drought. We have used a great quantity of the new peat litter which has been used under the horses, and found it an excellent mulch. After it has been trodden under the horses for some time it will be found to contain powerful fertilising properties, and thus in this condition its value will be considerably enhanced for the purpose of mulching.

Pears, Apples, and Plums have suffered to a slight extent with us in consequence of the dry weather, many of the crops of fruit being below the average in size. The Raspberry crop, too, in shallow soils was of short duration. The young growths of fruit trees generally are ripening splendidly, and there is not that tendency to grossness so characteristic of damp seasons. In the flower garden the drought has perhaps been felt the most. The majority of the annuals died very early and thus left many bare spaces. Groups of Petunias, Godetias, Zinnias, and Marigolds seem to enjoy it. Copious waterings late in the evening and early in the morning have been the order of the day.—A KENTISH GARDENER.

TOMATOES.

"THE game of Tomatoes is played out." So wrote one of the best practical gardeners in the kingdom to me a short time ago, and though I attach weight to what he says as a rule, I am bound to confess that, in my opinion, he is not at present in a position to arrive at a sound judgment on the matter on which he delivered his verdict. The most eminent of judges are occasionally wrong, as is proved by subsequent decisions in courts of appeal, and nobody thinks any worse of them. They decide according to the evidence before them, and if that is inadequate the fault is not theirs. I have had some evidence during the past two months that the "game of Tomatoes" is not quite "played out"—at least for the cultivators, as I have to pay 8d. a pound for fruit, and cannot get fresh well-ripened dishes for less. I have passed through the London fruit markets time after time, and found the retail price varying from 6d. to 1s. a pound, but the cheap samples were faulty, and really dearer than the others. The price, then, for good fruit in London and the suburbs has lately been that above-named—8d. a pound, and I suspect it has not been cheaper in the chief provincial cities and towns.

This price has not been received by the growers of the fruit. That is self-evident, because retailers must "live," and so must agents or salesmen; and they do live, and apparently live well. I will grant, what I suspect is true, that they have the "best of the bargain." I am still driven to the conclusion that the cultivation of this fruit is profitable when good crops are ripened in June, July, and early August. Towards the end of the latter month and in September the prices fall, but the cost of production is reduced, and even then I have still to be convinced that good crops are not remunerative.

I do not pretend to know very much about the cultivation of Tomatoes. I have grown a few in a small way, but not for sale. Still the yield was so good as to satisfy that the space devoted to the plants would not have been unprofitably occupied had the fruit been converted into money. At even 4d. a pound it would have paid for the land; or, in other words, a one-year's crop of Tomatoes was of decidedly more value than the land it occupied if the freehold had been sold.

Instead of the "game of Tomatoes being played out," I am of opinion that we are only on the threshold of a great commercial industry. So far as I can see, this fruit, that has been hitherto very much of a luxury, will shortly become a necessity of life. Not long ago, on visiting a London "chop house," and by no means one of the largest, it was observable that when a chop was ordered it was taken for granted a Tomato was intended as well. This was not the case a very few years ago. In reply to a question as to the increased consumption of Tomatoes, the caterer observed, "Increased, sir! yes, there is no doubt about that; here it has risen from half a bushel a week to half a ton, and we want more and more." The fruit is also being more largely consumed in a raw state than ever, and this habit is almost certain to grow, just as it has grown in America. Sliced and prepared very much like Cucumber, the fruit is much relished by vast numbers of persons, and the taste for it is certainly growing.

It is quite true that all growers of Tomatoes do not find the crops satisfactorily profitable. Like everything else nowadays, the crops must be heavy and the fruit of the first quality for cultivation to be remunerative. The days of large profits for

garden produce are gone for ever—that is to say, small quantities will not pay, but a moderate profit on greater bulks will enable skilled and enterprising cultivators to reap a fair reward for their labour. English-grown Tomatoes have not been sufficient for the demand of the nation during the past few years, and large consignments have consequently been welcomed from abroad. I have seen purchasers clamouring for them at the auction sales in the fruit markets, the fruit certainly not equal to that grown at home. Bearing this fact in mind I was not at all surprised to read of Mr. Phillip Ladds growing 100 tons of Tomatoes. He is evidently one of those individuals who do not believe in being "beaten by the foreigner." As a consumer, I wish him the success he is sure to win. I should like to see him and other great cultivators have depôts for the sale of their own fruit and vegetables in all populous centres. "Slow coach" cultivators will not agree with this; they call it "spoiling the market," I do not. High prices always did, and always will, check production and restrict trade; lower prices develop it, and make markets prosperous.

"There is not much money to be made out of Tomato-growing with the fruit at 9d. a pound," observed an individual who grew a small quantity and sold them at that price. I say there is a good living profit to be had if half that sum per pound is obtained. I am intimately connected with a hard-working and excellent grower of this fruit, who plants Tomatoes a yard apart, secures the plants to stakes, and from the top of these to string attached to the roof of a large lean-to glass structure. The yield is considered poor if not more than 10 lbs. are gathered from a plant; but more than twice that weight is gathered from many of them, and the culture is decidedly profitable. It would be if only 3d. per lb. were obtained for the produce. Twice the weight of Tomatoes can be grown in that way over the orthodox plan of merely covering the roof as in growing Cucumbers; but in the case alluded to the roof is in a great measure covered too, after the earlier fruit is gathered from the lower part of the plants. It is by this system of high and economical cropping, doubling the produce from a given space, of that once regarded as satisfactory, that compensates for the reduction in price and leaves a balance on the bulk equal to those secured in the "good old times" of great profits and slow returns. The last-named old policy must be reversed, and it will be. There is no other course that can be relied on than to grow maximum crops of whatever is in demand, converting them into money quickly; and cultivators who do not act on this principle will simply be left behind in the keen competition of the world.

The grower of Tomatoes referred to does not grow them for himself. He is no doubt well remunerated for his labour; at least, he is satisfied, and the owner is satisfied too, as an individual well may be in his excellent position. All kinds of fruit and vegetables are grown in the establishment, and grown well, but nothing pays better than the Tomatoes do, if as well.

With another example I am familiar. A gardener in a single-handed place having learned how to grow Tomatoes well contrived to erect a rough house for himself. The proceeds of the crop enabled him to erect another house much larger and better; a portion of the produce of the second house sufficed for a third, a third for a fourth, and so on until he was justified in resigning his appointment, and he is now in a much better position as a Tomato grower for himself than he could ever hope to attain as a private gardener.

I have recently been going round the garden of a London merchant. Like many others of his class he looks at things with a keen business eye, and although the produce of his garden is not sold he appraises it as if intuitively, and is not slow to grumble if a crop is not of more value than it has cost to grow. He values his Grapes, Cucumbers, and Tomatoes, all of which are admirably grown. Such is the force of habit, and his verdict is that "Tomatoes pay better than anything." He has not made many mistakes in his time, or he would not have raised himself from the position of a workman to that of an employer of upwards of a thousand men, and it is not probable that he errs in the relative estimate he forms of his crops. I should like to see more Tomatoes grown, and if grown well they will pay the producers; but I must confess I am writing from a selfish point of view, for I am—A CONSUMER.

DOUBLE IVY-LEAVED PELARGONIUMS.

THE many and varied forms of these extremely useful plants at the present time constitute a valuable group of highly decorative plants, the more remarkable since it appears but the other day when the variety known as *König Albert* stood alone among the doubles. Not so now, however, for during the past few years the numbers of new varieties of this important class are

annually on the increase, so much so that I am at the present time acquainted with something like fifty good double varieties.

To attempt to speak at length or give in detail the uses and variety of circumstances to which these plants adapt themselves would appear somewhat superfluous, since the name which has done so much to popularise them seems sufficient in itself. For hanging baskets, for brackets, for window boxes, for vases in the terrace garden, and in fact any position where hanging plants can be used with good effect, none can be better suited than these. Their thick, fleshy, and somewhat succulent leaves render them capable of withstanding drought to a far greater extent than most plants, for it not unfrequently happens that basket plants often suffer through insufficient waterings, simply because they are not quite so conveniently placed. They thrive well in town houses and smoky districts much better than most plants, while as pillar plants for the conservatory they will vie with any plants I know for general effect; illustrative of which, I may remark that Messrs. Pearson of Chilwell grow them in this way in one of their long span-roofed houses, where they may be seen to advantage growing naturally and flowering in the most profuse manner. The best varieties only are grown in this way, and viewing them from either end of a house 100 feet long they produce a most telling effect. There are still other uses for these plants, for they may be trained on trellises either for exhibition purposes or for home decoration, and as such would prove both novel and charming, and as many varieties grow quickly and produce ample foliage they would hardly fail to produce the desired effect.

Nor must we omit to give them their due as ordinary bedders, and as such they deserve of a more extended or general use. They flower for the most part with remarkable freedom, and are not quite so formal as the Zonal type in this respect. This season we have bedded out many hundreds in several of the best varieties, and considering that our soil is extremely light and stony, and that the weather has been exceedingly hot for weeks, they have proved a great success and form an agreeable change.

Though during the past five or six years the hybridist has been busy among these plants and has been rewarded by many fine forms and great diversity of colour, we still stand in need of a good and pure white, which will take time in fixing no doubt, as the whites at present in cultivation are heavily suffused or veined with pink. I will now briefly describe the leading and most distinct forms at present in cultivation. Albert Crousse, light salmon shaded magenta, very large and double, and one of the most distinct and effective, good vigorous habit, and suited either for pillars or trellises; Anna Pfitzer, this is one of the freest flowering and considerably earlier in coming into flower than any other kind, it is adapted for any purpose, the colour is bright rosy pink, flowers semi-double, and quite a favourite; Candeur is one of the best whites at present, it is a good white and very double; Comte Horace de Choiseul, a strong vigorous grower, having enormous trusses of rich rosy pink flowers, very free and effective, an excellent pillar plant; Comtesse Horace de Choiseul is of a satiny rose colour, having small compact trusses, which are freely produced; Faustin Hellic, though distinct in colour is not so attractive; Gloire d'Orleans has compact trusses of rich crimson magenta flowers, this makes an excellent bedder and is equally good for basket and such work, the trusses are borne remarkably free, and it continues a long time in flower, this is certainly one of the best; Isidore Feral, a most pleasing and delicate satiny lilac, very distinct.

Madame Thibaut, no one who has seen this will for a moment doubt its superiority over all existing doubles; it is extremely handsome and cannot fail to receive due appreciation. Those who had not previously made its acquaintance had a splendid opportunity of doing so at the recent meeting of the Royal Horticultural Society, July 28th, when Mr. Cannell of Swanley contributed a well flowered group of plants; the habit is sturdy and vigorous, and the flowers, which are of a rosy pink, are good in form and produced in bold trusses. Jeanne d'Arc, too, among the newer varieties stands out rather prominently as a good white. The form of the flowers are better than in most varieties—indeed, in the trusses alone there is a marked likeness to a double-flowered Zonal; the same may be said of some few others. Mont Blanc is a white shaded or flushed with pink, of dwarf habit, and free flowering; M. Barrall is a silvery pink, very pleasing, trusses and flowers large, and freely produced; M. Dubus has flowers of a deep reddish pink, very distinct and pleasing; M. Pasteur has rich magenta flowers, well formed and good trusses.

Madame Crousse is a free grower, in colour a charming rosy pink, good for pillars, trellis, or baskets; this and the variety known as Anna Pfitzer are so very near in colour that the two are not desirable in one collection, still both are excellent.

Madame E. Galle has lilac blush flowers, very double; Mdle. J. Wouters is of a beautiful rose, interspersed with carmine, very distinct; Robert Fortune is a bright carmine pink, flowers very double and beautifully formed. In Vice-President Joly we find flowers of a soft pink, slightly suffused blush, very pretty; Gloire de Nancy, moderate sized flowers of rosy lake, quite distinct; Congo is one of the most effective of newer varieties, of good size and substance, and of a light lilac, with rosy centre, the margins being lightened with silvery white, and Abel Carrière has soft magenta coloured flowers, shaded maroon, very fine; Madame Jules Menoreau, rich rosy salmon, well formed; Souvenir d'un Ami, clear rosy lilac, flowers well rounded; Aglai Anderson, rich magenta, silvery reverse; M. Chevereul, rich carmine, bold and telling; Floribunda, deep salmon rose, of good form. Having only a short experience with several of the latter and newer forms I cannot speak confidently respecting them; I may, however, remark that those cited are the best among many new varieties, and are possessed of the good qualities so desirable among these plants—i.e., good constitutions, and so far they appear free bloomers.—J.

MR. TAYLOR'S ALTERED PRACTICE.

MANY of your readers besides myself must be curious to know the reason of Mr. Taylor's altered practice in regard to pruning Vines, as described by "W. I." last week, and who states that the Vines in Mr. Taylor's new charge were propagated and planted last year, that "all made most satisfactory progress," but "all the black Grapes were cut down to within 14 inches of the ground" at pruning time! It will be well within the remembrance of readers of Mr. Taylor's book on the Vine that he has there declared that "he had become a confirmed extensionist," that he explained that extension meant leaving long canes the first year; and in his chapter on "the first pruning" he states that "cutting down the stem of a Vine does not add to the vigour of growth;" adding, "the growth at the end of a young healthy Vine left 12 feet long will not compare unfavourably, even at starting time, with that of a similar Vine which is cut down to the ground." At the beginning of the same chapter he also explains that "having taken the greatest care to grow the Vines through the first twelve months, he dared say it would surprise professionals that he did not choose to follow the fashionable plan of cutting them down, adding, that if he did cut them down, and was asked which part he would throw away, "in his case the top would be the most valuable." These being Mr. Taylor's sentiments so lately as a year or two back, and seeing his Vines last year made "most satisfactory" growth, I ask his reason for reverting to restriction in its most barbarous form, and which he has himself so energetically condemned. Teachers like Mr. Taylor ought to be held to the principles they profess, or be made to explain their vagaries. Nothing could be more damaging to the extension system of pruning Vines than the admission by one of its most earnest advocates that he has himself been one of the first to abandon it and go back to the practice of those he so severely condemned.—J. S. W.

PEA G. F. WILSON.

I WRITE to say what an excellent Pea for dry weather is the G. F. Wilson. I proved it to be so last year and again this season. I am in the habit of sowing four sorts at one time—viz., Caractacus, William I., Veitch's Perfection, and G. F. Wilson; they come in capital succession to each other. This year they were sown on March 12th, and from that time till they came in for use there was only one rain to benefit them, and that was on Whit Monday. Nevertheless, G. F. Wilson Pea maintained its sturdy stout growth, and deep green colour throughout; the pods were filled, with from eight to ten peas in most of them, and when sent to table it was pronounced first-rate in flavour, and a first-class Pea.—THOMAS RECORD, Royston.

BRITISH QUEEN STRAWBERRY.

HAVING to provide a family with Strawberries I grow a good patch of Sir Joseph Paxton and President, but towards the end of the fruit-gathering a dish of British Queen, grown in the village, was presented to me, and I decided to plant a few as a trial. When I had lifted the crop of Potatoes, manured and dug the land at the end of September, the runners were planted in the following fashion:—The runners being very small were planted three in a clump, the clumps being 30 inches apart. They grew well, and produced a very fair crop the following year. I kept them free from runners after I had laid what I wanted, and no digging was done in the autumn, but we gave them a good dressing of manure, in the spring hoed between the rows, again giving them some stable manure, which being rather long acted as straw, and kept them clean. The crop this time was very heavy, the fruit also large, and the flavour good.

Last October having some large runners I lifted them with balls of roots, planting firmly, and they produced a very good crop of fruits this year. These British Queen Strawberries have surprised not a few, myself included, as I was always led to believe it was a very tender variety. I believe the success is due to the ground being in good condition, firm planting, no digging, which destroys the best roots, and lastly plenty of stable manure. My fruiting plants, two years old, I kept entirely without

runners until we had finished gathering the fruit on August 1st.—STEPHEN CASTLE, *West Lynn*.

NATIONAL PEAR CONFERENCE.

I, WITH many others, have received the circular of the Committee of the forthcoming Pear Conference, and those who have not had a circular direct have no doubt seen the announcement of the Conference in the gardening papers. The Conference is to be. As I happen to be one who has a grievance carried over from the Apple Conference of 1883, I feel disposed to air it in order that similar mistakes may be avoided in the coming Conference. The Congress invitation circular of 1883 says that one of the objects of the Apple Congress is "to correct their nomenclature." "Very good I said to myself," "I'll send a few samples that I particularly want the correct names of." I sent some six or seven varieties, and never heard a word about my Apples, not even that they were received, until the publication of "British Apples" in 1884, and in it, to my wide-eyed astonishment, on page 84 I found myself credited with sending up one variety, and to my greater surprise, the one variety which I had put in almost haphazard, and about which I did not care two straws, it being a well-known local Apple. Not a word is said about those I had sent to have their nomenclature corrected, either good, bad, or indifferent, from that time until now. A paragraph of the report on page 5 of "British Apples" says, "The Committee met on several occasions, and, working in sections, made careful examination of the exhibits with a view to the correction of nomenclature, &c., these corrections having been sent to the various exhibitors. It has not been considered necessary to refer to them in the report." All I can say is that I have not received my corrections up to the present date, August 14th, 1884; and if others of the exhibitors have not received theirs, there is, I think, a substantial error or grievance to persons to be remedied in the forthcoming Pear Conference in October next.

In the circular for the prospective Conference the correction of nomenclature is again a prominent object of the Conference. If I send this time I hope I shall receive my corrections within some reasonable time. Would it be too much to ask that a post card, which could be easily prepared beforehand and printed, leaving open spaces for date and number of exhibits, &c., be sent to each sender of fruit? It is a little bit too cool and negligent not to acknowledge in any way one's consignments; and I say again I had no intimation of mine having been received or not until the publication of "British Apples" a year after, save and except that I received from nurserymen who grow fruits largely, and with whom I had no previous acquaintance in the interval, copies of their catalogues.—N. H. POWNALL, *Lenton Hall Gardens, Nottingham*.

[The experience gained at the Apple Congress will enable the Council of the Royal Horticultural Society, under whose immediate direction the Pear Congress will be held, to make adequate arrangements for conducting the business in a more systematic manner than was possible on the former occasion, when there was no past experience to guide in the matter. The officials were overwhelmed, and their duties were not lightened by the misdirection and late delivery of numbers of parcels and by the non-compliance of not a few senders of fruit and letters with the published conditions. We do not suggest that our correspondent was a delinquent in any way; it is more probable that he was the victim of circumstances beyond his control, and which could scarcely be foreseen and provided for. The officials laboured assiduously in discharge of their duties, and did all that was possible under the extreme pressure to which they were subjected to render the Congress generally satisfactory.]

VIOLA PYROLÆFOLIA.

THIS very beautiful dwarf, hardy herbaceous plant, was introduced from Patagonia thirty years ago by Messrs. Veitch, and grown by them and distributed under the name of *V. lutea*. It produces a tuft of small, cordate-ovate, radical leaves, with ovate or linear-lanceolate fimbriate stipules, and produces very large, bright yellow blossoms, each elevated considerably above the foliage on a slender stalk. The flowers have a short blunt spur, and the petals are bearded inside with club-shaped hairs; the lower petal is obcordate, streaked with red lines. It is found in Chili, as well as in the Straits of Magellan; and has been known under the following names:—*V. maculata*, *V. glandulosa*, and *V. lutea megaphyllos*.

NOT ENOUGH MANURE.

IF there was any doubt about the great value of solid manure, and the excellent results attending its free use in the garden, this I should say would be effectually dispelled during the present hot summer, but before I treat upon manures I wish to touch upon trenching again. After the remarks anent trenching from my pen, published in these pages, I fully expected to be twitted upon the subject, and I have not been deceived, as several correspondents have recently pointed out good results attending the practice of trenching. It will be remembered that the tendency of my arguments was condemnatory of the general practice of trenching, and in spite of the trying season of 1885 I am still prepared to argue on much the same lines, not, however, from a mere wish to be thought wiser or more consistent than my fellows, but from conviction. I still say the practice of trenching, or even bastard trenching, is not always judicious either for improvement of soils and the consequent increase in the value of

the crops, or by way of preparation for a dry season. If I had not travelled out of this district and seen various other gardens, or even had not tried several experiments in trenching this season, I should not venture a repetition of my old assertions. Whenever I have been in conversation with an intelligent farmer, market grower, professional or amateur gardener, I have sounded them as to the state of their various crops, inquiring particularly as to the preparation of the soil, and the result of my investigations is that trenching is a doubtful practice, much more in fact depending upon a liberal use of manure and a proper surface preparation.

In our garden, for instance, land trenched two spits deep has long been completely dried up, and the Roses, Peas, and Runner Beans which occupy it are now in a wretched plight. On the other hand, where the ground was freely manured and roughly dug early in January, this was thoroughly pulverised, admitting of its being properly broken down to a good depth, and subsequent surface stirrings have preserved the moisture

Fig. 28.—*Viola pyrolæfolia*.

to a surprising extent. Thus without trenching and without any appreciable rainfall since the first week in June, we have not failed with one kind of vegetable. At the present time (August 11th) we have presentable Peas, Beans Broad, Kidney and Runners, Cauliflowers, Globe Artichokes, Spinach, &c., not up to exhibition form I admit, but quite good enough for a nobleman's table. Watering any of the foregoing, with the exception of Peas, was out of the question, and the moisture to support them had to be derived from the fairly well-manured surface soil and the cool unbroken subsoil. Early Potatoes, again, are not so small as might have been expected, while the breadths of *Magnum Bonum* and *Champions* are still healthy and vigorous, and that, too, without the assistance of a particle of solid manure. The ground was well broken up to the full depth of the forks, and that is the secret of the success in this case.

One of the largest farmers on this estate recently informed me that he has invested £2000 in machinery, but took care to point out that steam ploughs or cultivators were not included, nor would they be used under any consideration on his heavy clayey land. I hazarded the opinion that he would not be troubled with much straw this season, and the reply was

to the effect that it would "show above my head;" and as I am about 5 feet 9 inches in height, that Wheat straw is quite long enough; neither will the yield, so I was informed, be at all "short." "How about the root crops?" is the next question, and the reply was that he had twenty acres of Swedes and Mangolds in a highly satisfactory condition, and about the same extent very patchy indeed, and might not be preserved, transplanting being out of the question. In the former case the land had been laid up roughly in time for the cold drying winds to penetrate thoroughly, and soaking rains enabled the surface cultivation to be properly carried out. The other breadth was a failure, simply because it was occupied with Vetches during the winter, and could not be subsequently got into good working order; it was "nubbly" in fact, and "nubbly" ground, no matter how deep it may be, is bound to quickly lose its moisture by evaporation.

Coming near the centre of horticultural advancement, we have further stronger proofs of the necessity of good surface preparation as a precaution against drought. Near Rainham in Essex a large deeply ploughed and heavily manured breadth of land was cropped with Runner Beans, and these early in the season looked very promising, the owner confidently anticipating a much earlier and better crop than would be obtained in a "notchey" breadth of the same vegetable owned by a friend of mine. The latter sent 160 bushel sieves of Beans to market before either the Rainham grower or many other growers, and realised double the price for his "sendings." Of course I asked how he managed this, and he at once made use of much the same expression as the farmer above mentioned; his ground was well manured and thoroughly broken down, whereas the Rainham growers' was "nubbly."

It does not follow that because I do not recommend trenching as a panacea for all evils I am encouraging thriftless or lazy habits; on the contrary, if my advice is followed and more pains are taken in the matter of improving the surface soil, nearly as much labour will have to be expended on it as in the case when trenching is resorted to. The free working of heavy soils will not often be improved by the addition to it of a portion of the subsoil, though the latter may increase the fertility, and I have no great faith in the efficacy of a deep root run. Burnt clay, garden refuse, including the accumulations from the potting bench, coal and wood ashes, leaf soil, peat, sand, and any other available fine material freely added to, and well mixed with, the surface will serve to render it more open and fertile, as well as increase the depth. If the subsoil can be improved by draining, or be gradually rendered fit for bringing to the surface by the addition of various decaying matter, so much the better, but in many cases it is best left alone. Shallow light soils usually rest on a subsoil of a nature totally unfit for bringing to the surface, and in most cases I should prefer to increase the depth of fertile soil by adding various accumulations, marl, road trimmings, and solid manure.

This brings me to my text again—viz, "Not enough manure." How many gardens in the country get sufficient solid manure, more especially that formed in a farmyard? Not one in fifty, I should say, hence the many failures in hot weather, as well as numerous disappointments in all seasons. We ought not to be asked to make bricks without straw, or, in other words, we ought not to be expected to produce heavy crops of superior vegetables and fruits without proper supplies of manure, solid or artificial, as the case may be. Good farmyard manure is considered by all authorities, I believe, to be unrivalled in its composition, its decay when it is mixed with the soil being chemically and mechanically effective, nearly or quite restoring the whole that the soil has been robbed of by almost any crop. That this is strictly the case is very evident, or the market farms, where trenching is not thought of, would have long since become unfertile. It is no uncommon occurrence for the proprietors of these to manure the land at the rate of fifteen to twenty-two horse loads of manure, or, say, at the rate of twenty-five to forty tons to the acre, with perhaps nearly or quite as much for the succeeding crops. They manure heavily and they crop heavily, and one condition must in every case accompany the other, or failure will inevitably result. I have known cases where the land was heavily manured for Runner Beans, and the next season similarly treated for Potatoes, and the crops of the latter have not only paid, as far as weight was concerned for this outlay, but the quality was also good. Poisoned land is an unknown experience with them, as they take out all they put in, and sometimes more.

It must be remembered that the manure they use is not a mass of mouldy semi-decayed straw, nor a heap of solid hotbed manure devoid of nearly every constituent that goes to form a perfect manure, and which I am sorry to say is the kind of manure most plentifully used in the majority of gardens. Market growers use nearly fresh, moist, and frequently steaming hot manure with but little straw in it, but from which little or any valuable properties have been evaporated, or else washed away. Straw half-decayed manure, such as gardeners get from the well-kept stables of the well-to-do classes, may improve heavy land in that it renders it more finely divided, but there is no stability in it, and it must be supplemented with special manures if the land is to be made the most of. The mass of humus that passes for manure, and which we get from the old hotbeds, may serve to preserve the moisture in any soil, and therefore assist in the disintegration of other manures added to or contained in the soil, but it is most deficient in phosphates, salts, potash, and other ingredients contained in a perfect manure, and these must be added or failure is certain. Land is more often poisoned by this imperfect manure than it is by good manure, and in this case an addition of a small quantity of subsoil to the surface, or a dressing of quicklime, nitrate of soda, or other remedies may prove effective in that they either restore or liberate the required ingredients. Given plenty of manure such as the market growers get I would undertake to succeed with vegetables and

most kinds of fruit in almost any fairly well situated garden and during all seasons, and that, too, without trenching. Better have 1 foot of well-worked and freely manured ground than double that depth of partially manured, and which is almost unavoidably "nubbly." For the uninitiated I may add that by "nubbly" land I mean such as consists principally of hard lumps which refuse to separate when the ground is dug or surface-stirred, and which during dry weather quickly part with what little moisture it contains. Even mulching with manure or litter is of little avail in this case.—W. IGGULDEN.

FLORAL DECORATIONS IN LONDON HOUSES.

WHILE in London for ten days lately I had many opportunities of seeing these, and the results were charming. The garden papers have often contained reports of the carpet, Calceolaria, and other beds in the various London parks, but in my opinion details of how some of the best decorations are executed during the London season would be more interesting, and an agreeable change. The flowers used in June and July might be of a different class to what would be in season at other times of the year, but the arrangements could be carried out on much the same lines. Very often in the winter time we country folks have tables to decorate for large shooting parties, and by substituting Camellia blooms for Rose blossoms and other flowers then in season the tables might easily be arranged after the London season style. A great many flowers are not so much wanted in cases of this kind as graceful arrangement, and it is in this that the London florists excel. That my remarks may be as practical as possible I will confine them to one house at present—this is 5, Grosvenor Square, the London residence of W. C. Brooks, Esq., M.P., where on the 8th of July I saw some magnificent decorations. They were carried out by Messrs. Nieman & Cornish, of Orchard Street, Portman Square, and charmed everyone who saw them. In the front hall there was a bank of Palms, including tall *Seaforthias* and *Chamadoreas*, with bright flowering plants underneath, the principal of these being *Liliums* in great variety, *Crassulas*, and fancy *Pelargoniums*—a rich and elegant group, and the whole was fringed with *Isolepis gracilis*. A little further on some window recesses were adorned with graceful plants of *Cocos Weddelliana*, *Hydrangea paniculata*, *Crotons*, white *Lilies*, and the tall feathery *Chamadoreas* drooping gracefully over the whole. Outside on the balcony, which also formed a promenade, there were banks of green moss, containing masses of crimson and white *Roses*, which had a grand appearance.

The drawing-room was especially attractive. The mantelpieces and side tables were occupied with many choice Orchid blooms, *Cattleya Mendelli* and *Odontoglossum Alexandræ* being very conspicuous amongst them. Pink *Carnation* blooms were plentifully used, and long spikes of the white *Tuberose* and *Gladiolus The Bride* were displayed on a groundwork of sprays of *Adiantum farleyense*. The recess of one of the fireplaces was faced with a large mirror, bordered with rustic work, and garnished with long sprays of *Asparagus tenuissimus*, *Caladiums*, small *Ferns*, and the whole was most artistically embellished with rare Orchid blooms.

The back windows of the drawing room were taken out, platforms erected outside, and large blocks of ice were built up on these, the margins being fringed with tall reeds, wild grasses, and common *Ferns*; coloured lamps (amber, green, and blue) were lighted behind, and the effect was splendid. Long trays full of water were placed underneath the tables, and these were filled with aquatic leaves and *Water Lilies*. In the boudoir there was an immense *Kentia*, with a tall stem and large spreading leaves, and seats underneath. Another large mantelpiece was surrounded with *Orchids*, *Liliums*, &c., and the fireplace was converted into a little dell of green moss and *Rose buds*. The corners of the rooms were tastefully filled with *Palms*, *Ferns*, and *Lilies*, and the appearance of the whole was attractive in the extreme. The rooms were cool, and the atmosphere delicately laden with the fragrance of many flowers.

A day or two previous to the date named above I saw some exceedingly beautiful dinner tables there. Over thirty sat down, and being a large table scope was given to the florists' art, and it was taken full advantage of. The massive gold bowls which stood between the candlesticks were filled with the choicest of Orchid blooms, fresh fronds and sprays of the finer forms of *Asparagus*. An undulating line of *Stag's-horn Moss* was laid on the cloth all round the table, and this was studded with crimson *Roses*. The moss just named is excellent for the purpose, and is brought from one of Mr. Brooks' estates in the north of Scotland. Each of the candlesticks and flower vases along the centre of the table were surrounded at the base with huge wreaths of splendid *Roses*, and small plants of *Caladium argyrites*, *Palms*, and *Ferns*. The *Roses* were chiefly scarlet and pink. These were obtained by the thousand from some of the chief *Rose* nurserymen, and I am sure all *Rose* growers would have been delighted with the magnificent results obtained by the tasteful and profuse introduction of the queen of flowers.—M.

In reference to this subject the following cutting has been sent us from the *Kingston and Surbiton News*, describing the plant and floral decorations provided by Messrs. Jackson & Son at the Mayor's dinner in Kingston last week.

"The entrance hall was grouped on each side with growing shrubs, while inside the lobby were several small collections, befittingly filling the several corners without causing obstruction or inconvenience, and at the same time contrasting most favourably with the surroundings, and adding brilliancy to the whole. Passing along by the staircase and passage, also highly decorated, into the Mayor's reception room, the eye rested on a most unique and complete arrangement in one of the corners, while in front of the pilasters stood elegant and graceful Palms, Ferns, &c.; *Cocos Weddelliana*, *Dracæna australis*, and *Blechnum braziliense* being most prominent. At the extreme end was a most meritorious collection of rare exotics, the admiration of every beholder. In the background were tall Palms, relieved by a grand weeping variety of *Phormium tenax variegata*; the original variety usually grows rigid and erect, but that under notice has a weeping character, which, combined with the various markings on the foliage, contrasted effectively with *Crotons Disraeli* and *Wiesmannii*, *Dracenas Goldiana* and *terminalis*, and others. Lower down were three neatly trained specimen Heaths, two of *Erica Marnockiana*, the centre one being a grand piece of *Aitoniana Turnbulli*. The groundwork was composed of *Adiantums*, from which sprang several fine varieties of Orchids, notably several magnificent spikes of *Saccolabium Blinmei majus*, one spike of which measured upwards of 2 feet in length. There were also several fine *Odontoglossum Rossi majus* and *vexillarium*, with *Masdevallia Harryana*, which were conspicuous by their extreme beauty and curiosity. The whole was edged with well-grown examples of the loveliest of all the Maidenhair family for this purpose, *Adiantum gracillimum*, and made a most effective arrangement indeed. Passing from here through the corridor to the dining-hall, everyone must have been impressed with the simple but at the same time most unique arrangement brought about by the happy thought of utilising as a boundary wall of this passage one side of a building, on which had previously been neatly and regularly trained the Vines growing there. Just at the present time the foliage is of the deepest green, and the small clusters of Grapes added to the novel effect. At the foot, on either side, were small decorative plants, so that the combination seemed quite a fairy scene, rather than the work of man. Thus was Nature adapted so naturally that even experts wondered and inquired how such an effect was brought about, while it formed a cool relief from the warm and magnificent dining-room, which was most elegantly arranged throughout. Every available space was here brought into use to add to the brilliancy of the whole. In each of the corners were small groups; in other places Palms drooped their graceful foliage; while on either side of the Mayor's seat were two groups of miscellaneous plants in semi-oblong form, and in each of which beautiful Orchids were very prominent. *Saccolabium*, *Aerides*, *Oncidium*, and *Odontoglossum* each by their beauty contributed their share; while *Lilium longiflorum*, *Ixora grandiflora*, and the scarlet plumes of *Clerodendron Koempferii*, contrasted most favourably. On the ledge which ran the length of the dais on which the principal table stood, a handsome and varied collection of plants and shrubs was placed; and in front of the ladies' boudoir *Hydrangea paniculata grandiflora*, with *Adiantum cuneatum*, were largely employed. The value of the plants thus employed would mount up to many hundreds of pounds; about 800 Ferns alone were worked in. Mr. Pntt.ck and Mr. Sheppard were mainly responsible for the beautiful arrangements, and Mr. Latham, from Messrs. Jackson's gardens at Hampton Court, also assisted.

VINE VAGARIES.

UNDER the above heading I would call the attention of your correspondent "Thinker," and the many other able writers on Vine culture that contribute to the pages of the *Journal of Horticulture*, to a circumstance in connection with Grape culture here which I have observed for some years, but for which I can on no hypothesis account.

Some fourteen years ago we planted a span-roofed house with Muscats. It was found that in this high cold district they did not ripen well in span houses, and we determined to convert the house into a Barbarossa house. We shook out and planted a young Barbarossa Vine beside each Muscat, and inarched the former, which was weak, on the latter, which was strong. The union was in every case effectual, and the progress good. After a time we found that Gros Colman took the market better than great 6 lb. and 8 lb. bunches of Barbarossa, and we put bottle grafts of the former on to each Vine above the junction of the previous two sorts. These took hold, and now the Vines are bearing fine crops in the house, and here comes what to me is a puzzle.

We left some Vines with two legs in the ground, one a Muscat, the other Barbarossa, with the bottle graft above their junction; others we put on the Barbarossa below the junction, and cut away the Muscat, pulling up its roots as far as we could; in other cases we inarched or grafted, more properly speaking, on the Muscat, and cut away the Barbarossa. Thus we have some on the Muscat stock, some on the Barbarossa, and some on both; and while those on the

Muscat and those on the Barbarossa are about equal as to crop, they are at least a month more forward than those on the joint Barbarossa and Muscat stocks. The latter have, if anything, the finest foliage and show most vigour, the crop equally heavy; but while the Grapes on the single stocks are nearly black in some cases, and fit for market, those on the double are perfectly green, and whoever grows Gros Colman knows what this means. We have three examples of the double stock, and all tell the same tale.

The stocks, where they are two-legged, are as vigorous and healthy as those that are on single stocks; they have from four to six bearing rods like the single ones, and every May they are treated the same. Had those inarched on the Barbarossa been the late Grapes I would have blamed the stock, but that idea is barred by the fact that the Grapes on that stock are as early as on the Muscat, and, as I have already stated, a good month earlier than those on the joint Muscat and Barbarossa.—WM. THOMSON, *Clovenfords*.

NEPENTHES.

It would probably be difficult to determine any plants more interesting or attractive than well-grown *Nepenthes* laden with large pitchers. We have observed that no occupants of the plant stove arrest the attention of visitors so quickly as a number of *Nepenthes* in baskets suspended from the roof at the end of the house. These plants are certainly not amongst the most ornamental when they are poorly grown and badly pitched, they are unfortunately more generally met with in this condition than the reverse. I am inclined to believe that these plants are frequently subjected to too much shade, and in consequence they grow rapidly, but do not pitcher freely. Our plants have improved wonderfully in this respect since their removal from the shadiest end to the lightest. If exposed to the full force of the sun the foliage soon turns brown, an indication that the light is too strong for them. But if the rays of the sun are broken and as much light as possible admitted to them it will be found that the growth made is slower, sturdier, and very much firmer, a condition essential to the production of large highly coloured pitchers in larger quantities than is the case with plants grown under almost dense shade, as is too generally practised.

Another mistake frequently practised in the culture of these plants is to allow the growths to run unchecked, for when once fairly started they are not long before they reach the top of the house if left unchecked. When once they commence growing with such luxuriance they cease producing pitchers, and are of no real ornament in the stove. This should not be allowed, but directly a shoot shows signs of running it should be pinched back. The pinched shoot will soon break again into new growth, and pitchers will be again most freely produced. With a little judicious care in pinching the various shoots of a good-sized plant from time to time it will very rarely be found at any season of the year to be destitute of pitchers, which are really the interesting feature of these plants. *Nepenthes* should never be allowed to run up with a single stem, but as soon as they have been rooted and made a few inches of growth so as to become established in their baskets pinch them, and again directly they produce a leaf which will not bear a pitcher. It is surprising how soon a large bushy plant will be produced by this method without loss of time and pitchers, as is the case when the plants are allowed to grow with a single stem and have to be cut back to induce them to break again from the base. Probably *N. Hookeri*, *N. Rafflesiana*, and the large distinct free-pitching variety *N. Mastersiana*, the most beautiful of all, are the most worthy of cultivation. The three produce pitchers of very large size, are good growers, and distinct. Many of the smaller-pitched kinds are worth a place for the sake of variety where any attempt is made at growing a collection.—SCIENTIA.

TWO GOOD WHITE ZONAL PELARGONIUMS.

QUEEN OF THE BELGIANS.—In the remarks in *Journal*, page 107, respecting Mr. Ladds' Nursery, Queen of the Whites *Pelargonium* is mentioned. This I do not know, but it has induced me to give a line in favour of Queen of the Belgians. I obtained one plant early this season from Messrs. Cannell & Sons, and from the first was pleased with its strong robust appearance. However, having but little heat until March I let the plant alone, pinching the trusses out as they formed. By the end of March I was able to take three strong cuttings, which soon made plants; and being anxious to know what it would do outside I planted one out. One was kept in a pot outside without protection, and I am more than satisfied, not only with its free flowering, but also the pureness of the white flowers, not the least tinge of pink being seen. The plant in the cool house has been admired by all. In addition to the three plants

named the stock plant has furnished me with five other good plants, which are now throwing up fine trusses. It is not often we get spring cuttings so free as these are. I intend having a good stock of this variety, and commend it to the notice of the public as a plant of first-class quality.

LE CYGNE.—This double white I obtained at same time from the same firm as Queen of the Belgians, and as soon as it came into flower there was no doubt as to its quality, both for size of truss, single pips, and pure white colour. I discarded all my older doubles. Madame Ballet and Candidissimum plenum had been my chief stock, but these are not to be mentioned with Le Cygne. I must say the spring-struck plants surprise me with such large trusses of flowers without any special attention. So far every cutting has struck and done well. I intend to propagate it largely, and am obliged to destroy the young trusses, as I want to get a stock.—STEPHEN CASTLE, *West Lynn.*

PROPOSED EXHIBITION OF PLUMS.—It has been suggested that, as a great variety of Plums are fruiting this season, it would prove extremely interesting as well as instructive if examples of as many sorts as possible could be sent to the meetings of the Fruit Committee on the 25th of the present month, and on the 8th of September next. An excellent opportunity would thus be afforded of comparing the merits of the varieties of Plums in cultivation, and also in the correction of their nomenclature. It is known that many inferior varieties of Plums are grown throughout the country, whilst many new and greatly improved sorts are comparatively unknown. Intending exhibitors who cannot be present should address their packages to the Secretary of the Fruit Committee, Royal Horticultural Society, South Kensington. The carriage of the same will be paid by the Society. It is very desirable that young shoots with foliage should accompany the fruit, so as to facilitate identification.

BULBS FOR THE PARKS.—We understand that the Metropolitan Board of Works have this year accepted the tender of Mr. B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, to supply their London Parks with Hyacinths, Tulips, Narcissi, &c.

MESSRS. FOSTER & PEARSON, Beeston, Nottingham, request us to state their PLANT HOUSE, FRAMES, BOILER, &c., at THE INVENTIONS EXHIBITION have received a silver medal, no gold medal being given in that section.

THE WEATHER IN SCOTLAND.—Mr. D. Thomson, Drumlanrig, writes:—"This has been the most extraordinary summer here of which there is any record. Excepting a few days in the latter part of July we have not had what could be called a summer's day. Twice in July the thermometer fell to 36°, and once to 34°. On August 14th it registered 32°, and on the 15th, 31°, when Vegetable Marrows, French Beans, and Tropæolums were blackened. Everything is much later than I have any recollection of; for instance, Red Currants are not yet (August 15th) ready to gather for preserving, and Scarlet Runners will not be of size sufficient to use this season." We also learn that in Scotland about Callander there has been a considerable fall of snow. This is an extraordinary contrast to the hot dry weather we have been experiencing in England.

DR. A. PATERSON, Fernfield, Bridge of Allan, N.B., sends us two spikes of CATTLEYAS WARNERI AND DOWIANA, the blooms being magnificent in size and colouring. C. Dowiana was a little past its best, but had been exceptionally fine, the lip nearly 3 inches in diameter and 4 inches long. "They have been in flower for about a month," says our esteemed correspondent, "and I did not like to cut them before, they were so beautiful."

A DURHAM correspondent writes:—"I have read with much interest the correspondence in your valuable paper on the SPLITTING OF FRUIT, and send the following note in reference to the subject. I have the temporary charge of a new vinery planted in June, 1884, and I have only allowed two bunches on each cane, but have had four pot Vines carrying a good crop, and for an experiment I closed the house one hour earlier and raised the temperature 7° by night, with the result that the berries began cracking very badly. I then lowered the temperature to 65° by night, and I have not had a berry crack since. I have miscel-

laneous greenhouse plants in the vinery and pot Tomatoes carrying good crops."

MESSRS. JAMES CARTER & Co., 237 and 238 High Holborn, have sent us some specimen blooms of their CHALLENGE PRIZE STRAIN OF BALSAMS, of which they now have a very pretty display at the Perry Hill Nursery. The blooms were extremely fine, full, and beautiful, the following shades of colours being represented:—Flesh, purple salmon, white, scarlet, crimson, pink, densely spotted purple, white marbled with violet, and white marbled with rose. The blooms were from 2½ to 3 inches in diameter and very symmetrical in form.

A LAMBETH amateur writes—"Some of your readers may like to know that a new Chrysanthemum Society has just been started in the town of Halstead, Essex, called the HALSTEAD AND DISTRICT CHRYSANTHEMUM SOCIETY. The President is Colonel A. S. H. Lowe of Gosfield Hall, and the Vice-Presidents, Geo. Courtauld, Esq., M.P., and J. R. Vaizey, Esq. The first edition of the Society's schedule, comprising eighteen classes, has now been circulated, and the Exhibition will be held on Tuesday the 17th November next in the Town Hall, Halstead. The Secretary is Mr. Edwin Bentall, Halstead."

"S. C." writes as follows:—"I question very much if there is a scarlet variety to equal double Zonal PELARGONIUM F. V. RASPAIL. The habit of the plant is good, it is readily propagated, and is very free flowering. I have called it double, but really it is semi-double, the outer row of petals being quite distinct from the centre florets; the truss is large, and the single pips very fine. As a bedding Pelargonium I find Vesta a good variety. I have a few planted out, and like it very much. My plants were very small, but they soon made themselves at home, and have flowered very freely.

"SOME seedlings of LAVATERA ARBOREA VARIEGATA were raised in the spring and potted with the intention of growing them in pots; but I soon found that, however ornamental the plant might be, it was going to cost too much for tobacco paper to kill the green fly, so I decided to plant them out of doors. They are now in full beauty as regards foliage. This is a very conspicuous plant as a single specimen, and would do well in shrubberies, but I do not have it too near the flower garden, as it is such a favourite with the aphides, both black and green. The variegation is good, though at one time I thought it would be all green."

MESSRS. E. WEBB & SONS have sent us from Stourbridge sample pods of their new PEA, THE CHANCELLOR. They are large, scimitar-shaped, and crowded with fine peas, but, unfortunately, they were too old for us to form an estimate of their quality.

A KEW correspondent sends the two following notes—"PRIMULA CALYCINA is again coming into flower with us, having already given a good display about two months ago. It seems to have been one of the unfortunate Primroses in the way of synonyms, as it has no less than three—P. glaucescens, P. lævigata, P. integrifolia, besides being often confounded in gardens with P. Wulfeniana and some of the varied forms of P. spectabilis, from both of which the true P. calycina is abundantly distinct even in the cultivated state. It grows from 3 to 6 inches high, forming dense rosettes of beautiful dark glossy leaves, the margins of which are finely serrated and undulated, a reliable distinction when out of flower; leathery in texture, ovate lanceolate, pointed, and tapering gradually to the base. Its large flowers, almost an inch in diameter, are of a clear lilac, and very handsome; from four to eight in a head. It seems to thrive best in a mixture of loam and lime rubble, the latter predominating, on low shelves of the rockery, and having a west exposure. It requires plenty of water during the flowering and growing season. It is easily increased by division, which may be done in the autumn after the growths have been made. A native of the southern Alps, flowering May and June."

"THOUGH long known and cultivated in English gardens, the BERGAMOT, MONARDA DIDYMA, seems to have lost ground within the last few years, for what reason we know not, unless that in the ordinary border in the dry hot seasons it is inclined to dwindle, and a severe winter kills it outright. This state of things we believe is in a great measure due to want of water, there being no wide difference between this and most North American plants as regards treatment. We have tried it in a bog bed along with Droseras, Pinguiculas, &c., with remarkable success, and it is just now throwing out runners a foot long, and so numerous as to form quite a network all round the plant. Under the latter conditions it grows between 3 and 4 feet in height,

with half a dozen leading shoots, which branch and result in a grand display of deep scarlet flowers in large head-like whorls. It has a grand effect amongst foliage plants at the present time. Others are *fis ulosa*, and its variety *purpurea*, the latter being a really handsome plant, and *Kalmiana*, and which do very well on shady borders. They are excellent bee plants, and should be grown by all who combine beauty with utility in the garden. They may be increased by dividing the roots during autumn."

— **AUTOMATIC IRRIGATION.**—In very dry seasons there is a great demand for water upon the gardens, lawns, and conservatories, and any apparatus which effects a saving of the gardener's time must of necessity prove invaluable. Messrs. Merryweather of Long Acre have devised various systems for automatically distributing water. They devised a system of non-corrosive metallic tubes in short lengths mounted upon easy running carriages and connected with flexible joints; the metal pipes being perforated throughout their whole length, so that by simply attaching one end to a hydrant or standpipe the water will run through a length of 60 or 90 feet of piping, dispersing itself on the land through the whole course of pipes by means of the perforations. It is very easy to move the apparatus from place to place at intervals. Another system consists in similar moveable pipes without the perforations; to open at the extreme end, to which a distributing nozzle is attached. The nozzle is capable of throwing the stream in either a jet or a spray at the will of the operator. A third apparatus is both ornamental and useful, as it consists in a portable revolving fountain upon a stand, to which hose may be connected. Garden hose or lead or iron pipe so small as half an inch in diameter can be connected to the inlet coupling, and the water supply taken from the hose system 8 feet or more above the fountain or direct waterworks pressure. The sprinklers are beautifully nickel-plated, and they rapidly rotate by the action of the issuing water, scattering a shower over a wide area. The latter is arranged inverted to screw up to the ceiling of a fernery or conservatory, and thus scatter the water downwards and sideways.

— WE are informed that the thirty-eighth TAVISTOCK COTTAGE GARDEN EXHIBITION, which took place in the market on Wednesday last week, was, in point of fact, as good an exhibition as the Society has held for many a year, competition in many of the classes being very keen. The contributions from the country gentlemen were superb. The beautiful display of Roses from the Torquay Roseries should also be mentioned as affording a source of much enjoyment to lovers of horticulture. Mr. W. H. Chichester, of Grenofen, did not send a collection of plants this year, but his stand of beautiful double and single Begonias was a sight seldom to be seen at a cottage garden show. The vegetable exhibits were quite up to the mark as regards excellence, although there was a slight falling-off in the numbers as compared with former years. Some magnificent bunches of Grapes stood out conspicuously among the collection of fruit, which is always the weakest point in connection with the Tavistock Show. The Devon and Exeter Bee-keepers' Association held its first Exhibition in connection with the Society, which excited much curiosity. The market was tastefully decorated, and reflected credit on those who accomplished the task. The Duke of Bedford, the patron of the Society, attended by Mr. Wing and Mr. Rundle, visited the Show, and evinced much interest in the Bee-keepers' Exhibition. The President for the year, Mr. W. S. Rosevere, J.P., was also present. The members of the Committee, and Mr. H. E. Monk, the energetic Secretary, did all they could to insure the success of the Exhibition.

— **WRITING** in reference to BORDERS OF HERBACEOUS PLANTS, "A Gardener" observes that "Many gardens where the culture of hardy plants is made a specialty have proved a partial failure. This is not always due to mismanagement, but is the result of the dotting system, which does not render a garden the most effective or the most enjoyable. A collection of these plants for flowering at various seasons of the year do not and never will commend themselves to the flower-loving public when dotted in beds and border. The beauty of a plant in flower is destroyed by two or three, or probably more, of its neighbours that have died or dying down to leave the ground bare and vacant half the season, or only to look untidy during that period. There can be no doubt whatever that these plants display their real beauty and true character much better when kinds flowering about the same time are massed or associated together about the grounds, the surroundings being suitable, than when planted on the dotting system. The system I mean will readily be understood by the following example or two. At this season what could be more beautiful than a good group of the old *Lilium candidum* display-

ing its pearly white fragrant flowers against a background of dark green Hollies or Portugal Laurels, or a large group of Delphiniums surrounding, say, *Acer Negundo variegata*, or the latter in the background? Any light, scarlet, orange, yellow, or intermediate colours show themselves to perfection with dark green shrubs for a background."

THE TURNER MEMORIAL PRIZE.

THE report in the Journal states the Committee have decided that the cup given by subscription in memorial of the late C. Turner is to be won three times at the National Dahlia Show. As a subscriber to the fund, I consider it to be a prize; if so, why should it be made so uncertain? Will you kindly allow me space to ask who is to guarantee that the funds may be found to support that Show, or that the Crystal Palace Company may continue their grants? also will any person stage their best flowers for so uncertain a prize which may be never again able to produce such? Nature any season cannot be depended upon. If it is to be a challenge cup it should have been with a sum in addition, by subscription, say 10s. for every competitor. Under the present terms those who have subscribed are to be supplemented by persons who have not contributed anything. Trusting the Committee will reconsider the subject and allow nurserymen and amateurs to compete who subscribe, the amount to go to the winner, and the cup to be held over for three winnings after.—THOMAS GARRATT.

THE HISTORY OF THE CHRYSANTHEMUM.

(Continued from page 131.)

THE introduction of Mr. Fortune's Japanese varieties does not appear for some few years afterwards to have been generally so much appreciated as the subsequent improvements in that class have been. English florists up to the date of their appearance had set up a standard of perfection, of which the incurved variety was the type, and undoubtedly from a purely florist's point of view that particular section comprises the flowers mostly deserving of such an opinion. Mr. Salter probably felt the same way inclined, for when he announced the distribution to the public of almost the first set of this species he raised, he somewhat apologetically observed that although they were not what are termed show flowers they were still very interesting. Notwithstanding, however, the opinion of Mr. Geo. Glenny and others of the period, the Japanese was not allowed to be doomed to total extinction, as might possibly have been the case had not the public and visitors to the exhibitions been surprised and delighted with their curious form and brilliancy of colour. To this fact may almost be attributed the renewed and unceasing interest evinced by the flower-loving portion of the community at the time in which we are now living, and for the same reason a fresh impetus was given to those growers and raisers who had made the Chrysanthemum their study and business. Their efforts now seemed to be redoubled, and for years past so great has been the improvements and so numerous are the fresh additions, that the Japanese section bids fair to become the most important and extensive one, if it is not so already. Among those first sent out, which still remain with us, are *Baronne de Prailly*, *Bronze Dragon*, *Comtesse de Beauregard*, *Grandiflorum*, *Madame Godillot*, *Striatum*, *Yellow Dragon*, *Comet*, and *The Daimio*, which were presently succeeded by *The Mikado*, *Hero of Magdala*, *James Salter*, *Dr. Masters*, &c.

In 1869 the nursery at Hammersmith was required for railway purposes, and to the great regret of all enthusiastic growers of this plant, Mr. Salter, who had been established there for over twenty years, retired from business and died in a few years. This was deplored by all who knew him for many reasons, and there was nowhere for the public to see the novelties of the day excepting for a year or two at the establishment of Mr. Forsyth. This well-known grower, although a very able and skilful cultivator, was in no respects a raiser in the same sense of the word as Mr. Salter. It was thought that when Mr. Forsyth ultimately went to New Zealand, where he still lives and grows the Chrysanthemum with the same enthusiasm as of yore in his home at Otago, that the Chrysanthemum had had its day, and for several years it seems to have been rather under a cloud. But the Japanese varieties were yearly increasing and pushing their way to the front, by which in a great measure the popularity of the Chrysanthemum has been and will be sustained for years to come.

In the Channel Islands of late years the raising of seedlings appears to have been much more neglected than it was a quarter of a century ago, for, with the exception of Mr. Downton, the raiser of *Elaine*, *Miss Eyre*, *Mulberry* and *Fair Maid* of Guernsey, and Major Carey, who is now the only one of importance left, there have been no important additions for some time from that part of the world. Major Carey's seedlings, from information obtained by the kindness of a relative residing in Jersey, appear to have been—in 1875, *Beaumont*, *Bello of Japan*, *Emperor Nicholas*, *Sir Isaac Brock*, and *Yokohama Orange*. 1876, *Diamond*, *Bijou* of Guernsey, *The Khedive*, *Peter the Great*, and *Red Gauntlet*. 1877, *Ethel*, *Sultana*, *The Czar*, and *Sarnia*. 1881, *Mrs. Chas. Carey*, *Victoria*, *Hackney*, *Holmes*, and *Japanese Violet*.

In 1881 Messrs. Veitch & Sons imported from Japan six new sorts called Bend Or, Comte de Germiny, Delicatum, Duchess of Connaught, Kæmpfer, and Thunberg, all of them being so well known as to require no comment on their merits. Two or three years later Messrs. Mahood & Son were successful in raising some seedlings, and the three varieties sent out by them, bearing the names of Mrs. Mahood, Joseph Mahood, and Mrs. Townsend, are stated to have been selected from over 300 seedlings raised by them.

Mr. Salter's retirement was probably the reason why so few purely English-raised Chrysanthemums of all sections have been obtained since he discontinued the work, although there have been some very valuable contributions both before and after that event by the florists of this country, Mr. Rundle, Mr. Bull, and Mr. Hayes being some of those who are specially worthy of mention. Mr. Alfred Salter, the son of the great raiser, is still engaged in continuing the work begun by his father, and during the past two or three years has distributed Annie Holborn, Comct, Distinction, Gloria Solis, Salterii, Maid of Athens, Mary Salter, Rob Roy, Tubiflorum in the Japanese section, and a few other kinds.

There remain also to be mentioned among raisers of our own country, Mr. Cullingford, Mr. N. Davis, Mr. Geo. Stevens, and Mr. Teesdale, whose flowers may be found described in any of the catalogues issued by the nurserymen who are in the habit of dealing to any extent in this plant.

We must now take one more look at the French, and it is with no little regret that the author is compelled for the sake of brevity to limit his account of their recent triumphs.

A few words must therefore suffice. For the past twenty years those French florists who have taken up the culture of the Chrysanthemum have been working at their improvement steadily but surely. They have not only produced varieties of far greater superiority to any of the earlier kinds, but they have been instrumental in producing varieties for which in brilliancy of colour may be said to be unparalleled.

This, it should be borne in mind, does not apply to the incurved kinds, but more particularly to the Japanese and Pompon varieties. They have created a new race hitherto unknown which we call the Japanese Anemone, and of this class, although consisting of something under a dozen distinct sorts, much may be expected. The most prominent raisers in France of very recent times, with some of whom the author is in personal communication, are

Dr. Audiguier, the raiser of Dr. Barrié, Joseph Durban, L'Infante d'Espagne (syn. Soleil Levant), Mdle. Blanche Pigny, Mons. F. Marrouch, Mons. J. M. Pigny, Souvenir du Maréchal Niel, Silvie, Madame Berthe Pigny.

Mons. Boulanger, who has sent out Gloire de Mazargul, and several other sorts not very generally grown at the present time in this country.

Mons. Victor Lemoine, who raised Fulgor, several Pompons, and large-flowering varieties.

Mons. Bernard, who sent out Gloire Rayonnante, M. Frémy, Reine Margot, was also the raiser of a few Pompons and others.

Mons. Boucharlat, noted principally for his Pompons, some of which belong to the liliputian class.

Mons. Lacroix, not to be confounded with the amateur of the same name, a comparatively new raiser whose best known flowers are Mdle. Moulis, Souvenir de la Reine Mercédès, Parasol, Mdle. Lacroix, Flocon de Neige, Tendresse, the splendid incurved Jeanne d'Arc, the Japanese Anemone, Fabian de Médiana, wrongly printed in English catalogues Fabias de Maderanaz.

Mons. Marrouch, to whom we are indebted for Madame Clémence Audiguier, Marguerite Marrouch, Mons. Marrouch, Madame Clos, Madame Thérèse Clos, Marie Jolivart, Mdle. Cabrol, Sœur Dorothée Souillé, and Souvenir de l'Ardenne.

Mons. Pertuzes, whose flowers are not very well known in England, excepting perhaps Timball d'Argent and Triomphe de la Rue des Châlets.

Mons. de Reydellet, an amateur raiser of great promise, whose new Japanese Camieu received a first-class certificate last autumn at the Crystal Palace. He has altogether in the last few years raised and distributed a large number of varieties amounting now to upwards of 100—C. HARMAN PAYNE.

(To be continued.)

HAMPTON COURT.

It would be difficult to find flower gardening carried out in any part of the kingdom, whether in private or public gardens, on the same high standard of excellence as in the public parks and gardens of London. Most provincial public gardens have little high-class flower gardening, while in many fine parks not a flower is to be seen, but in and about the great metropolis every endeavour is made to render these public resorts as gay and attractive as possible. That the public most highly appreciate

the floral decorations provided for them, is proved by the fact that hundreds of thousands wend their way annually to Hampton Court, alone to examine and criticise the "bedding." It was with this object that I made my way to these gardens, which have become so widely famed of late years for its carpet and other bedding. Those who reside in the country and have not visited these parks, can form only an inadequate idea of the enormous amount of care and labour required to provide a change in the arrangement of the plants and the design of the beds. It is astounding how Mr. Graham succeeds in making new and suitable designs year after year, but such is the case, and it is plainly evident that one less skilled in the art of flower-gardening would certainly fail, or have to fall back upon old designs. There is, however, no trace of failure at Hampton Court, and no lack of elegant designs, for the carpet beds are this season more beautiful than ever.

Carpet bedding and beds filled with Pelargoniums are not the only styles of flower gardening carried out in these gardens; on the contrary, a great diversity of plants is employed. For instance, the long border skirting the Palace and terrace walk, probably half a mile in length, has the wall covered with Roses, Clematis, Flammula, and very beautiful this is at the present time, and other climbing plants, while half the length is filled with a choice assortment of hardy herbaceous plants, while the remainder is arranged with subtropical plants at the back, the front is planted with a line of Beet, next to this a row of Pelargonium Flower of Spring, and edged with Ageratum Cannell's Dwarf. Beds are filled with Roses dotted about the grounds, and large beds and borders, forming a background to many of the flower beds, are filled with a large and choice collection of herbaceous plants. Carnations and Picotees are represented by about seventy varieties, while Phloxes and Lilium auratum are amongst the most conspicuous of the hardy plants in flower. Very noticeable also in these borders was a species of Achillea—sent to Mr. Graham by Mr. Ware—that attains a height of about 4 feet, and produces large heads of its bright golden flowers. This is a beautiful decorative plant for this season of the year. Another bed, which is merely mentioned to show the variety of the arrangement and the style of planting, had been beautiful with the old Lilium candidum, and a little earlier in the season with Delphiniums planted amongst them. The latter having been cut down close to the ground after flowering will soon be in full beauty again. Another beautiful bed for autumn in this department is planted with an early-flowering Japanese Chrysanthemum Madame Desgranges, edged with a wide band of Aster Amellus bessarabicus, one of the finest of the Michaelmas Daisies. Other very fine autumn beds might be noted, but I shall leave this department with a mere mention of Lilies that are largely grown, being raised by thousands, and under the system pursued will flower freely in about three years. I am not in a position at present to state the method of propagation and culture pursued by Mr. Graham, but have no hesitation in saying that the discovery he has made and is practising, will revolutionise Lily culture entirely when publicly known, and bring them within the reach of all who have a few square yards of garden.

Amongst mixed beds and those in which Pelargoniums formed the principal feature, one planted with Pelargonium Mrs. Pollock in the centre, mixed with Viola Favourite and edged with Coleus Verschaffeltii, was very conspicuous. Another striking arrangement was formed with Flower of the Spring Pelargonium, carpeted with Viola Tory and edged with Pelargonium Golden Harry Hieover. Another beautiful arrangement was planted with Pelargonium Black Douglas carpeted with Viola Blue King, the combination of these two being really charming. A broad band of Coleus Taylor's Pet, a dark dwarf compact grower, admirably adapted for flower gardening, edged with Alyssum saxatile variegatum completed the design. Perhaps the most perfect bed of these mixed arrangements was formed with Pelargonium Bijou, carpeted with Viola Favourite and edged with Iresine Herbsti. The companion bed to the last described was even more beautiful, the arrangement being exactly the same. A very striking bed was planted with Pelargonium Lord Gifford and edged with P. Manglesi variegatum. The first mentioned variety in this bed is worthy of special note; it is in colour very bright scarlet, large flower and truss, very free, brighter and more vivid in colour than the old Vesuvius, which has stood unrivalled for bedding purposes so long. Another charming bed, and one that will daily improve until cut off by frost, is planted with Veronica Andersoni variegata, mixed with Iresine Herbsti, and Verbena venosa, edged with Iresine Herbsti, and a narrow band of Stellaria graminea aurea.

Very conspicuous was a bed of Pelargonium Amaranth, pink, edged with P. Manglesi variegatum in flower, which showed a marked improvement over other beds edged with this variety and the flowers removed. An effective and telling bed was formed with Pelargonium Manglesi variegata, Iresine Herbsti, Verbena venosa, and Viola Favourite, mixed together and edged with Iresine Herbsti. Conspicuous was a bed of Veronica Andersoni variegata carpeted with Verbena Hampton Court Crimson, edged with Ageratum Perle Bleue, a decided improvement on Cannell's Dwarf. This variety is very dwarf and compact, and does not appear to run back, the same as is the case with the above variety. Mr. Cannell of Swanley recommended Perle Bleue to Mr. Graham's notice, and it has proved all that it was represented to be. All who desire a good dwarf variety for flower gardening should procure this variety, for it is decidedly the best of all dwarf-growing Ageratums. A good scarlet Pelargonium that figured conspicuously amongst others was H. M. Stanley, Pelargonium Lucius, Rose of Allandale, Surprise (full of bloom), and Warrior comprised some of the very finest used in the beds, while the dark Henry Jacoby was also strikingly effective. Two other mixed beds only will be noted, the first being planted with Abutilon niveum maculatum,

Iresine Lindenii, and Verbena venosa, edged with Iresine Lindenii; the other being planted with Tuberous Begonia Worthiana, recommended to Mr. Graham from Swanley, and tried for the first time. It is a beautiful scarlet variety, laden with bloom, and worth a place in all gardens where

latter being very full of flower, in fact more beautiful than they are generally seen, while the Violas have not grown too strongly to crowd the Pelargoniums amongst which they are planted.

Of all the beds in the garden it is clear that the public most appreciate

Fig. 29.—Lord Beaconsfield Raspberry. (See page 162.)

these beautiful plants do satisfactorily. The beauty of this bed was greatly enhanced by the groundwork of Viola lutea grandiflora major, a bright large yellow-flowered variety. Considering the dryness of the season it is surprising how well the Violas and Begonias are doing, the

those carpeted, for where one stops to examine any of the other beds hundreds surround and admire the carpet beds. It is not necessary to stay long to be certain of this, for the condition of the grass shows at a glance the effects of the traffic round these charmingly tasteful arrangements. Whatever may be said against carpet bedding by the advocates of hardy plants these will never replace it, and even if an attempt was made to employ them under the best arranged plan they could never produce the same beautiful effect as carpet beds when well done. The public enjoy and admire these carpet beds, and it would be simply madness to dispense with them for the purpose of employing hardy plants, however useful and beautiful they may be in their way. Certain positions are very useful for these plants, as can be seen by their adoption in these gardens, but the beds cut out in the turf as at Hampton Court are not suitable for them. One of the most beautiful carpet beds was planted with a raised oval bed of Echeveria Peacockii in the centre, at each end were groups of Pachyphytum roseum, and between these and the oval Alternanthera aurea nana, a beautiful bright yellow narrow-leaved variety, much superior to A. aurea both in colour and appearance. This is perfectly new, and was sent to Mr. Graham by Messrs. Cannell & Sons. At each end were a small circle filled with Kleinia Haworthii, a beautiful silvery variety that does not wash green by rain, but retains its distinct silvery colour, and very effective it is for carpet beds. The four central panels, two on each side the oval, were planted with Alternanthera amabilis. In the panel between these and the outer edge Leucophyton Brownii was conspicuous, while the four corners were formed with Abutilon vexillarium variegatum, the lines of the panels of succulents and Leucophyton being formed with Alternanthera grandis, Mesembryanthemum cordifolium variegatum forming the groundwork of the bed, which was edged with Echeveria secunda glauca and Sedum glaucum. It would be very difficult to determine whether the bed just detailed or the one to be described was the most attractive, both having beautiful designs and being so admirably finished; we came away undecided which really was the premier bed. The centre of this bed formed a Maltese cross planted with Sempervivum montanum, slightly raised, with an edge of Echeveria Peacockii, surrounded with Alternanthera grandis. Two small circles

half way between the centre and end of the bed were filled with "Cotyledon schaphyllus" margined with a narrow band of Alternanthera aurea. The panel between the circle and cross were planted with Pachyphytum roseum, the line being formed with Alternanthera amœna, while the one at each end of the circle was planted with Leucophyton Brownii. On each side of the circle at both ends were angular figures with circular ends pointing towards the centre filled with Alternanthera amabilis. The cor-

responding figures with the round end towards the centre were filled with *Alternanthera aurea*. The two central panels between these, with rounded ends to correspond, were planted with *Leucophyton Browni*. The groundwork running through the whole bed was the same as the bed above described, and the margins of the beds were also the same. This was a charming bed, and also another similar, in which *Leucophyton Browni* filled the outer panels in the place of *Alternanthera aurea*, with other similar slight alterations in the succulents and varieties of *Alternantheras* used, the groundwork, if I remember rightly, being formed of *Herniaria glabra*, the best of all green-foliaged plants for this purpose. Another very effective bed, which may be termed the snake bed from the fact that one formed the scrollwork on each side of the bed. The central scrollwork was formed with *Alternanthera aurea*, the corner pieces of this scrollwork being filled with *Alternanthera purpurea*, a very dark, effective, and distinct variety, while across the centre were small panels of *Iresine Wallisi*, a beautiful plant with dark foliage for carpet beds, being very dwarf, compact, and much after the style of *I. Herbstii*, but considerably smaller both in growth and foliage. The artistic scroll at the ends was formed with *Alternanthera grandis*, while a small panel of *Alternanthera amabilis* was conspicuous on each side *Iresine Wallisi*. The snake was formed of three bands, the centre one being *Alternanthera paronychioides* major with *A. purpurea* on each side, the groundwork of this bed being formed with a hardy plant, *Veronica incana*, and very beautiful and even it was, and contrasted admirably with the dark and yellow *Alternantheras* employed, the bed being margined very similarly to the two beds already described.

Another very effective bed had for its groundwork *Sedum glaucum* and *Mesembryanthemum cordifolium variegatum* figured and panelled with *Alternanthera grandis* and *A. paronychioides* and *A. aurea nana*, while *Leucophyton Browni* was principally used towards the ends, the centres being formed with "*Cotyledon schaphyllus*," *Kleinia repens*, and *Pachyphyton bracteosum*. The last bed that will be noted had circular centres formed with *Leucophyton Browni* and *Alternanthera grandis* alternately, panelled between with *A. paronychioides* major and *Mesembryanthemum cordifolium variegatum* margined all round with *Alternanthera*, the same as named above, the angles being filled in with *Herniaria glabra*, which also forms the remaining portion of the groundwork. All round the bed are a number of beautiful *J's* wrong side up planted alternately with *Mesembryanthemum variegatum* and *Alternanthera magnifica*, the last but one mentioned running all round the bed, which is margined with *Echeveria secunda glauca* and *Sedum glaucum*.

The number of carpet beds noted only form a very small portion of those to be seen at Hampton Court, which are in splendid condition, and have been admirably executed throughout. It is impossible to find a fault either amongst the plants, their arrangement, or the designs themselves. The beds are well filled, and have that excellent finish about them that renders these beds so striking and beautiful. They are decidedly better than I had anticipated finding them, considering the dryness of the season, which tells somewhat against these beds unless a large amount of labour is spent in keeping them well supplied with water. Many people are under the impression that carpet bedding cannot be done without using a large quantity of *Pyrethrum* (Golden Feather), which entails so much labour in pinching, yet in these gardens not one plant has been used.

It is difficult to describe these beautiful carpet bed designs to be thoroughly intelligible without figures, but all who desire can obtain them in Mr. Graham's little book, and the name of every plant employed, with other useful information, for the price of 1s.

It only remains now for me to thank Mr. Graham for his kindness, and congratulate him on the success he has achieved, and it is to be hoped that such an able and intelligent horticulturist may long be spared to carry out the work in which he is engaged. These notes would be incomplete without some reference to the old Vine, which looks as well as usual, and is again carrying about 1200 bunches. There is no fear of this famous old Vine suffering or being neglected under the care of Mr. Jack, who is a genial man and a good gardener.—B.

LORD BEACONSFIELD RASPBERRY.

WHEN a Raspberry is certificated by the Fruit Committee of the Royal Horticultural Society the variety must be considered meritorious. The variety in question was thus honoured in 1881, and excellent dishes of it have been exhibited during the present season. Messrs. Hieatt and Son of Covent Garden sent us fruiting sprays, some of them bearing over a length of 18 inches. The fruit is borne on long single axillary peduncles—that is, there is one fruit on a long slender stalk issuing from the axil of every leaf. That was the character in all the sprays we examined, but whether the peculiarity is constant we have no means of knowing. The fruit was large and of excellent quality, and the plant appears to be a vigorous grower. The specimens sent to us are fairly represented in the engraving, and the Lord Beaconsfield Raspberry appears worthy of being tried in gardens with other good varieties.

STOCKBRIDGE HOUSE, ULVERSTON.

STOCKBRIDGE House, Ulverston, North Lancashire, is an Elizabethan mansion of considerable age, and its surroundings show the great difference that exists between the ancient and the modern mansion

grounds. Here Nature has been assisted by Art to constitute a beautiful effect. We remember the mansion some thirty years ago as the residence of the Rev. Canon Gwilym, brother-in-law to Miss Strickland, authoress of the "*Lives of the Queens of England*," and as that lady resided much at Stockbridge House, no doubt much of her great work would be written there. Then no attempt was made to assist Nature by Art, but since the estate came into the possession of Miss Petty, its present owner, it has undergone a wonderful metamorphosis. When you enter the grounds you feel yourself isolated from the world, although but a stone's throw from the streets of Ulverston. Such is the privacy secured by a tasteful arrangement of trees, comprising Hollies, Yews, towering Pines, pink and white Hawthorns, Rhododendrons, Chestnuts, Walnuts, Laurustinus, Laurels, *Araucaria imbricata*, &c., the whole bordering a wide sweeping lawn of the greenest hue. Here and there are tastefully set out beds filled with choice varieties of flowering plants, and the larger trees have an inner fringe of flowering herbaceous plants, the whole being arranged with true artistic eye to harmonise colours. There are two large rockeries formed of limestone blocks taken from the neighbouring moors, and in the stones the rainfall of ages has wrought fantastic shapes. These rockeries are filled with a variety of Ferns, all of which are in a flourishing state, most of them collected in the district, the rockeries being bordered with *Echeverias*.

At the west end of the house is a group of nine giant forest trees—Elm, Beech, and Chestnut, which afford grateful shelter from summer's sun and heat. The viney is remarkably well stocked, Mr. Armer, the gardener, being a successful Grape exhibitor. They comprise Black Muscat, Golden Champion, Black Hamburgh, Trentham Black, Muscat of Alexandria, Mrs. Pince, Alicante, and Madresfield Court. In this house are also a number of excellently grown foliage and flowering plants. The Peach trees show a fair crop. The kitchen gardens are fully utilised, the walks being bordered by Apple rees, trained horizontally, and not above 30 inches high, full of fruit. A number of pyramid fruit trees, 8 feet to 10 feet high, are literally loaded with fruit. They comprise Hawthornden, Small's Admirable, Tower of Glamis, Warner's King, Cox's Pomona, Jolly Beggar, Cellini, &c. The vegetables are all freely grown, promising, and not a yard of soil seems to be lost in cultivation. The whole arrangement both of grounds and garden points a useful lesson of what may be accomplished by good taste on the part of the owner—for the lady is her own architect—when it is combined with skill on the part of the gardener.—R.

HERBACEOUS PLANTS.

IN looking over some beds of mixed herbaceous plants recently, with a view to remark on particular forms, or combinations of forms, I was in the first place struck with the grace and elegance which prevailed in all spots where what was termed spiry forms prevail. To give an idea of the forms I allude to, I may point to such as the *Liatris spicata*, the *Chelone barbata*, and some of the *Veronicas*, as those commonly termed *incana*, *carnea*, or *incarnata*, &c.; some of the *Lythrums*, *Dracocephalum speciosum*, *Anthericums*, *Aconitums*, &c. I am persuaded that many of our friends must have been struck with such forms, independent of colour; forms which perhaps convey impressions of airiness, sprightliness, and elegance. Now, begging pardon of our gorgeous *Geraniums*, *Lobelias*, *Verbenas*, and such like, these forms are not to be altogether despised; if we do not esteem them now, another generation is at hand which assuredly may do so.

If, then, such spiral forms prove a relief in beds of herbaceous, why not call in the assistance of forms in our modern massing system? The chief thing that wars against the practice would appear to be what may be termed a floral prejudice, arising from previous mental associations. The beautiful blue *Inula glandulosa*, one of the finest blues we possess—what a colour for bedding purposes! but no one could for a moment tolerate the enormous mass of Comfrey-looking foliage. But then *Phloxes* are not vulgar-looking; and many other herbaceous plants, when mixed by a massing system, would, I conceive, lose much of their mere border character.

There is the old *Chelone barbata*, at all times a dressy plant, and, I believe, a favourite with everybody. This elegant plant was highly esteemed half a century since. Why cannot this be worked up in a mass? It possesses high qualifications assuredly. Elegance of form, a character of foliage by no means commonplace, and lovely orange-coloured blossoms, which, dangling from slender pedicels, give a delightfully airy appearance to the whole; added to this, a minimum amount of foliage, both as regards individual size in the leaf and their collective amount. By-the-by, the latter is a great essential in flowers for bedding purposes; proportion here (as in most other things) being necessarily one of the elements of the beautiful as distinguished from the picturesque.

Another singular old herbaceous plant I may point to as possessing peculiar features for the massing system, I mean the old *Liatris spicata*, one of the most dressy and manageable things in existence, and no vulgarity about it. This excellent plant, although introduced to our gardens many years ago, is by no means general, but for what reason I cannot imagine. It has one most singular property; it is, as its name implies, a spike-flowering plant, but, contrary to the common mode of development in spike flowers, it commences blooming at the top of the spike and works downwards. Thus there are no raw-looking terminal points to wait for; its dressy character is shown at once in the upper outline. This plant appears to me to be peculiarly adapted to work up in a massing system; and I must continue to think that if our modern bedders would condescend to leap the barrier which separates our exclusives—the *Verbenas*, *Pelars*

goniums, &c.—and let them mingle with the throng, that such spiry forms would prove of infinite relief to those clumpy masses of blue, scarlet, &c., which it is extremely probable will soon be liable to innovation, whether from taste or fashion. This *Liatris* is a pale purple, which, if not of the most conspicuous character, possesses the merit of "freshness." The plant commences blooming in the middle of June by ordinary culture, but everybody knows that such plants, in order to carry out a special object, may be made to blossom a month earlier.

Now that I am about calling on old acquaintances, I may point to some of the *Veronicas*, as distinguished amongst spiry forms. There has been such a confusion of names in this genus, like the *Asters* and some others, that I am almost afraid to point to species applicable to the case in hand. Those I would name amongst spiry forms are such as are commonly called *V. carnea*, or *V. incarnata*, *V. incana*, and some other spiry kinds. I freely confess that their colours are not glowing, but their forms are elegant, and will be found of some service in the modern bouquet. At the time I write, we have some herbaceous beds with several of these *Veronicas* in blossom, and were they removed the beds would not carry half their present effect as to outline, &c. Some of the *Lythrums*, too, are spiry and elegant; but as to massing, there is so much of the ditchweed about their foliage as would give a vulgar appearance. They are,

Fig. 30.—*Pentstemon cordifolius*.

however, of much utility in the mixed herbaceous bed or border. The old *Draccephalum speciosum* is of this character, but would not come in with any massing system on account of its extreme lateness. This, like the latest *Asters* and some late *Phloxes*, is of much importance in borders, where it is desirable to carry out gaiety to the very edge of winter. The *Anthericum*, too, especially that with such slender flower stems and narrow grass leaves, and which used to be called either *A. liliastrum* or *liliago*, is a most genteel-looking plant of the spiry class; and from its pure white and lengthened flowering might be worked up in mixed masses where white was requisite. It has a beautiful effect near the margin of herbaceous or shrub borders.

If it be argued that such herbaceous plants grow too high, why they may be readily dwarfed by being potted and the pots plunged. One of the chief causes of the decadence of the herbaceous tribes was doubtless the neglected and exhausted state in which they but too frequently appeared previous to what is termed the bedding system becoming general. But *Phloxes*, for instance, in an old shrubby border, probably full of tree roots, and those receiving annual culture, are widely different. The former, with a profusion of lean stems, betokening exhaustion, with flowers of half-size and little colour, and which, of course, prematurely cease blossoming; the latter bold-looking, healthy, showy, and enduring. Indeed, the same may be said of most of these tribes, being like many a pot plant, although long known, when placed under high culture and well brought out.—N. R.

PENTSTEMON CORDIFOLIUS.

A PRETTY half-shrubby hardy plant of spreading habit, having downy stems. The leaves are small, green, shining, cordate-serrate. The flowers grow in large, leafy, one-sided panicles at the end of the shoots; the calyx is covered with glandular hairs; the corolla nearly $1\frac{1}{2}$ inch long, the tube almost cylindrical, the upper lip straight, the lower lip three-parted; colour, a rich dull red. Suitable for rock, banks, or against a wall. In-

troduced from California, mountains of Santa Cruz, in 1848. Flowers from June to October.

JOTTINGS FROM CLOVERLEY.

A DAY in the country occasionally certainly does those good who live in the neighbourhood of a town where everything is covered with soot, and vegetation has a difficulty to live. Some time ago an opportunity presented itself of visiting Mr. Heywood's beautiful home in Shropshire, where the luxuriant growth of the trees and shrubs, during the three or four years that had elapsed since a former visit, astonished me. I was aware that trees and shrubs flourished in such a genial home, but was scarcely prepared to find towering young specimens, perfect in health and shape, that had added yards to their stature. It is useless to plant in the neighbourhood of a smoky town the choicer forms of Conifers and shrubs, for they would only linger for a year or two, and during the greater portion of that time would be unrepresentable, miserable objects.

I could not help thinking during a quiet walk early in the morning that the Conifers and shrubs that were so freely planted twenty years or more ago would never look more beautiful than they do at the present time. With many shrubs and fine Conifers, age does not, in my estimation, improve their appearance. The beauty and luxuriance of youth which is so characteristic appears to pass away, and year by year they are very liable to grow thin, and thus become less interesting and beautiful after they once attain a certain stage. Symmetrical specimens of *Wellingtonias*, *Cupressus*, *Piceas*, and others, from 15 to 30 feet high, well furnished and thick, are noble ornaments about the pleasure grounds, whether viewed individually or collectively. Large quantities of these pyramidal-shaped trees massed together have, no doubt, a formal appearance, but in the grounds in question, what would be objectionable in this respect is broken by a great diversity of vegetation. For instance, large Oaks and other forest trees freely exist, while there are large round clumps of Portugal Laurels, Rhododendrons, Ghent Azaleas, and others, which add change and diversity to the scene, thus rendering the grounds attractive at various times and seasons.

It is surprising how Rhododendrons flourish as they do about the grounds and park, for in many places they have only a few inches of fertile soil for their roots to occupy on the surface. Beneath is a solid bed of hard clay, yet it would be impossible to find more healthy or luxuriant growth. When these plants are lifted it is impossible to get any depth of ball, the roots all being in a thin shell upon the surface. The secret of success lies in the fact that there is no digging about the roots to destroy them, as is generally the case in the majority of gardens. The plants spread their branches upon the grass, and, being thick, the foliage that falls from them and the surrounding trees is allowed to remain and decay. This not only keeps the surface roots moist during dry weather, but the decayed matter soon becomes a mass of roots, and proves just the material in which these plants make themselves at home. Whether upon light or heavy soil nothing better for Rhododendrons can be freely incorporated with the soil than large quantities of leaf mould in a half-decayed state. I have repeatedly proved that this prevents plants suffering from drought to a very large extent on light sandy shallow soils. It is surprising how moist the surface roots are kept, and how quickly they work into a good layer of decayed vegetable matter spread upon the surface in spring when the ground beneath is moist. When this is not done the surface roots are partially or totally destroyed during long spells of dry hot weather, especially if the plants have not much foliage.

Amongst the young plants of *Picea nobilis* I observed a great dissimilarity, some of them having a much more beautiful glaucous hue than others, being so distinct in this respect that at first I thought them distinct varieties. If one lot of plants had been grafted and the others seedlings, the marked difference in this respect might easily have been accounted for, but I suppose it is only natural that seedlings should differ as much in *Piceas* and *Cupressus Lawsoniana* as in any other plant.

From a distance the luxuriant mass of *Cupressus*, *Piceas*, Yews, Abies, *Wellingtonias*, Portugal Laurels, Rhododendrons, and other dark-foliaged evergreen shrubs and Conifers had a somewhat heavy sombre appearance. This could be wonderfully improved by the introduction of Golden Hollies, Yews, *Retinosporas*, and other light and yellow-foliage plants. *Acer Negundo variegata* does splendidly. Why not introduce more of it, for it is one of the most beautiful trees that can be grown for positions in which it will do well? Probably the row of symmetrical young plants that I noticed elsewhere of *Retinosporas plumosa aurea* and *Taxus elegantissima* are intended for this purpose, where they would be more suitable than in the position they now occupy. They have only been nursed in the richer soil of the kitchen garden until they attained some size, and are intended for some more prominent position. *Cupressus Lawsoniana erecta viridis* was growing alternately with the above, and most handsome it is; but those who grow it must be careful of heavy falls of snow, for it will open the plant by weighing down its branches and thus spoil its beauty. These were truly magnificent young plants, the two former resembling pillars of gold 5 or 6 feet high.

The last thought about trees and shrubs was suggested by the leader in the *Journal* fully twelve months or more ago. At Cloverley, as well as in hundreds of other gardens where vegetation is very luxuriant, the trees and shrubs are becoming crowded. This is merely alluded to in the hope that it may be the means of inducing some to recognise the evil of allowing shrubs and trees to injure one another in this way. It is useless to continue thinking that they should be thinned, action is needed without delay. If plants are too large for lifting the axe should be applied, not grudgingly, but liberally yet judiciously. Unless this is done soon in the

gardens under notice many noble young specimens will be ruined. The trees and shrubs certainly look well, mingling together their luxuriant branches and fine foliage, and it seems a pity to touch them, but they will not remain in the same condition as they are now. If noble trees are wanted, and the future beauty of the grounds considered, some sacrifice must be made; if not, in a few years the trees will be mere mop poles, bare and unsightly at the base. Every plant should have room to display its true character without being encroached upon by its neighbour, for one good plant duly proportioned is more pleasing than a hundred loose badly developed specimens. In exposed positions, Hollies, or whatever evergreens are found to do well, should be freely cut to keep them compact and thick, with plenty of light and air surrounding them, and then they will be found to brave storms with little or no injury.

Thinning should be done judiciously, for somewhere in the grounds alluded to an old Oak was very noticeable, from the fact that his gigantic branches were spreading over and smothering some common Laurels and a flourishing young Cupressus Lawsoniana or two. My advice in this case, after studying the position carefully, is, Spare the giant even if he destroys the smaller members, for there are plenty of them, and if not, they can be replaced in from ten to fifteen years. The Oak, when once down, could not be replaced, even in a century, by the most luxuriant growth.

The collection of Ivies on the outer wall of the kitchen garden attracted my attention during a previous visit, and upon returning home I sought out a wall upon which I could plant a collection. Before doing so, however, I thought again about the matter, as my experience with choice kinds in an exposed position had not been satisfactory, and so determined to plant the common Irish Ivy, which is the best of all green varieties when well managed. Of small marbled cut-leaved forms, Caenwoodiana has proved hardy, a good grower, and one that retains well its small but beautiful foliage. The two should never be mixed on the same wall, for the first-mentioned would smother the latter, and if not allowed to do so the wall would present an uneven appearance. Many of the variegated and fancy varieties, although strikingly beautiful, soon become thin and bare at the base, and if they do this at Cloverley, what would they do in smoky exposed positions where the air is polluted by sulphuric acid?

The flower garden is a large geometrical design laid out with Box and gravel walks, in close proximity to the mansion, and was certainly very neat. When carpet bedding was in its glory I used to admire this style of gardening, and thought it the most lovely of all. My views have changed since then, as carpet bedding, according to my idea, should only be admitted for the sake of change and variety, unless the wishes of others compelled compliance. My idea of what a garden ought to be, is one in which there is a little of everything from which a basketful of the most fragrant flowers can be gathered at will. I have before my eye a model garden in which there is always plenty of flowers from early in the season until they are cut down by frost. The secret of success lies in a judicious selection, and a number of really good plants in preference to a greater variety, that would only add confusion and give a much less display. But there is considerable variety in the gardening at Cloverley, and the carpet bedding is very suitable for the place it occupies, and looks much better than if the beds were filled with a mixture of herbaceous plants. There is a garden devoted to Roses, a small rockery of Ferns for a change, and a large garden for herbaceous plants.

I must just note, in concluding, a large house of Black Hamburg Grapes that were very good at the time of my visit. Many other things of interest might be alluded to, but I remember reading a full account of this fine garden in your pages a few years ago. It is evident that great credit is due to the owner, as well as to the gardener, Mr. J. Jones, for the former must have a strong love for gardening, or this large and beautiful place would not have been in the admirable condition in which I found it.—V.

WHITE FLOWERS IN GARDEN DECORATION.

IN the various improvements which florists' flowers have undergone the last few years, it must be admitted that but little has been done to obtain things purely white; the dazzling scarlet, rich purple, or gay yellow, have been more sought after than the simple colour whose claims to our notice it is my purpose here to call attention to; and as the number of plants blooming white is no ways meagre, a few remarks on the disposal of them may not be out of place.

I should think there are few visitors to a flower garden by twilight but who have been struck by the gay appearance a large plant of the double white Rocket has at that time; a large white Campanula (whose name I cannot call to memory), is equally conspicuous, as also are all other free-blooming white flowers, while their more gay brethren of the blue, red, and other dark hues, appear little different from the foliage they wear; if you go into the greenhouse the effect is the same, the white Azalea, pale-coloured Cineraria, and similar things attracting your attention. Now my readers will be saying, "We know all that, but we seldom visit such places at that time; but what has that to do with daylight gardening?" Have patience, and we will explain. We have said that white looks better than other colours in the dark, it is because it forms such a strong contrast to all around it—the foliage, the ground, or it may be the turf, nay, even the very atmosphere wearing a murky aspect, tend to strengthen that contrast, and show its perfection to greater advantage. Now, the same thing, or nearly so, may be done by daylight, and we will attempt to explain how and when it may be made to do so.

In very many gardens there are more or less of shrubby borders

having a front of flowers, and as such borders are generally at some distance from the house and principal walks, and their appearance at a distance is an important matter; in such borders, we say, plant abundance of white flowers—as Dahlias, Roses, Phloxes, Rockets, and similar things. The reason is obvious, the background of shrubs, &c., being higher, show the white blooms of such things to every advantage, while it is only on closer inspection (that is, when the eye takes a more limited view), that deep-coloured flowers look well at all. Let anyone dubious of this matter just examine a scarlet and a white Thorn closely, and then walk a distance from them and look again; the white one which looked well, even on close inspection, will look equally so as far off as the eye can discern colours at all; not so its companion, a very short distance is sufficient to confound the bloom and foliage. Now, this is just the same if a pink, red, or blue flower is planted in front of a mass of foliage of other things, the eye being unable to separate these colours from the green against which they are placed, they are consequently lost to view. Next to white are those pale colours approaching nearest to it, even yellow and white with a mixture of other colouring, but it is surprising how much the latter detracts from the effect white would have alone. How gay an orchard of Cherry trees in bloom looks at the distance of a mile, compared to one of Apples at the same range of view, the mixture of pink neutralising the latter; look also at an Elder tree, its bloom forming a strong contrast with its rich green foliage. The Gueldre Rose might form another example, if such were wanting, but it is hoped we have said enough to call the attention of your young friends to the subject; and if they have borders backed by shrubs or trees, or even where the eye of the spectator passing over them rests on a piece of turf or other dark body, we say plant white and other light-coloured flowers with unsparing hand. We should certainly not discard all others. What we mean, is to plant in such a situation more than the usual share of such colours, especially if appearance at a distance be an important point. The same remark holds good to massing or bedding-out in flower gardens where the beds are cut out on grass, which forming the base or background, the effect is much the same, though in a less degree than the shrubby border above in the flower garden. Other circumstances render a variety of colours indispensable, but it is to be deplored that in the directions generally given as to the planting of such beds, the background or rather groundwork seems to be entirely overlooked; certainly a set of geometric figures cut in grass ought not to be planted the same as if they were separated by gravel walks; in the former case white and kindred colours should be more liberally dealt out than in the latter, or, to speak more plainly, the colour approaching nearest to that of the gravel ought to be most sparingly used.

While on this subject I may remark, there is only one place where white flowers are out of character—that is, in a Dutch flower garden, where the walks intersecting the beds are laid with white shells; in such places the walks generally occupy one-third, or even one-half, of the entire area, and the bright glare they present to a summer's sun renders anything more of that colour superfluous. In all such gardens we would say, plant deep coloured flowers in greater profusion; and if for variety's sake you must have a white bed, edge it with something dark, as scarlet Verbena or blue Lobelia—it will not be so likely to blend with the walks. When gravel, sand, brickdust, or ashes are used for walks, we would say, use sparingly those colours approaching thereto; if, as we have said above, you wish to introduce one, let it have a rim of something blooming the reverse. But as this is foreign to the subject we have in hand, we shall say no more than again impress on our readers to remember, that if they want to make a flower border (backed by anything except a chalk cliff or whitewashed wall) look well at any distance exceeding fifty yards, they must plant abundance of white and other pale-coloured flowers; and where a great breadth of turf separates flower beds on the lawn, there likewise to plant the same colours in as great profusion as attention to other matters will allow them to do.—S.

THE ORCHIDACEOUS PLANTS OF HEREFORDSHIRE.

[Read at the Woolhope Naturalists' Field Club by C. G. Martin, Esq., President.]

(Continued from page 137.)

15, *Gymnadenia conopsea*, or Fragrant Orchis.—This charming flower may be found pretty plentifully within a few miles of Hereford. It is known readily by its rose pink colour, and its strong delicious perfume. I have for many years gathered it in a damp meadow near Aconbury Hill. It may be found, very sparingly, in most parts of our county during June and July, though it is singularly little known and appreciated. Some of the localities named for it are the Great Dward, Llanwarne, St. Weonards, Orcop, Fownhope, and Tedstone Delamere. Mr. Lees found it at Colwall and West Malvern. Mr. Ley reports it to grow in a meadow at Tram Inn, and Sir George Cornwall told me, some years ago, that it grows at Moccas. It has also been found in the Olchon Dingle, and the head of Crasswell Valley. The Rev. R. H. Williams informs me that it is common at Byford.

16, *Gymnadenia albida* is extremely rare in this part of England, though it is not infrequent in grassy mountain pastures, especially in the north. Its flowers are very fragrant, and cream-coloured. They grow in a somewhat dense spike, and the stem is rather shorter than *G. conopsea*. Mr. Ley found about thirty specimens in a single spot in June, 1880, growing in company with *Habenaria hifolia*, in a hill-side meadow at the head of the Gwynne Valley. I found one specimen only in June, 1868, in a meadow near Aconbury Hill, growing in company with *G. conopsea*. I have often searched for it since in the same place, but have not found it again. I showed it to the late Mr. Flavell Edmunds, who called it *Habenaria albida*, or Small White Butterfly Orchis. Bentham gives it the same name.

17, *Habenaria chlorantha*, or Great Butterfly Orchis, is a singularly handsome plant. It has a long loose spike of greenish white flowers, is well known, and is generally found in damp woods throughout the county. It is reported from every district. The larger nocturnal Lepidoptera are much attracted by its strong sweet odour and the abundance of nectar which it yields.

18, *Habenaria viridis*, or Lesser Butterfly Orchis, is similar in outward appearance to the last, though smaller. Bentham and some other botanists regard them as varieties of each other. But a close examination reveals many permanent differences, and Mr. Darwin observes, "I cannot doubt that the Larger and Lesser Butterfly Orchids are distinct species, masked by close external similarity." It is found throughout our county, and it is needless to particularise localities. Neither of these plants suggests the idea of a butterfly, and it is difficult to understand how they ever became so designated.

19, *Habenaria viridis*, Frog Orchis.—There appears to be even less reason for calling this the Frog Orchis than there is for naming the two last-mentioned flowers the "Butterfly." It is a small plant, and is very inconspicuous. Its stem is 6 or 8 inches high. Each floret has a green helmet and a greenish brown lip. It is not uncommon on pastures, chiefly in hilly districts, but probably its colour prevents its being readily observed. It has been reported from almost every district in our county.

20, *Ophrys apifera*, Bee Orchis.—There is no mistaking this charmingly pretty flower. The stem varies from 6 to 12 inches in height, and generally bears a few distant florets. The ovate sepals, which resemble wings, are generally of a delicate lilac tint; the petals are small and narrow, sometimes the same colour as the sepals, and sometimes greenish white; the lip, which looks so like the body of a bee, is brown, variegated with yellow, and is soft and velvety.

"The Orchis rare with varied beauty charm,
And mock the exploring bee, or fly's aerial form."

This plant is not common in our county, and, unfortunately, where it grows it is in danger of being exterminated by too zealous or too selfish collectors. Hence it is undesirable to mention the localities where it may be found. It may be looked for on limestone or cornstone pastures and banks, especially the latter. It grows in great abundance on the chalk downs of our southern and eastern counties. It is a noteworthy circumstance, and deserves special recognition, that *O. apifera* has been, during this season of 1885, abnormally abundant, and has been found in several new localities in our county. From one place alone more than fifty plants were brought to me, and the gentleman who found it said he "could have gathered more than a hundred flowers in a space not more than five yards square." (Numerous specimens were produced).

21, *Ophrys muscifera*, Fly Orchis.—This plant is much rarer than the Bee Orchis. It has been found on the Great Dward both by Mr. Purchas and Mr. Ley. It was found in 1850 upon the Little Dward. Mr. Ley discovered it in 1880 on Copet Hill, and again in 1883. Mr. Watkins has picked several flowers on the Great Dward this year. There are no other well authenticated localities for this pretty Orchis in our county. I have gathered it frequently, year after year, in Surrey, at the end of May and the beginning of June. Its florets are about the size of a common house fly. The greenish sepals resemble the wings, and its slender lateral inner sepals are not unlike the antennæ of an insect; while the narrow brownish purple lip, which is two-lobed at its extremity, has a pale blue spot in the centre.

These are, so far as I know, all the Orchidaceous plants known in our county. I have seen it stated in a botanical work that "*O. militaris* is common in Buckinghamshire, Oxfordshire, and Herefordshire." I think that is an error so far as our county is concerned. Neither Mr. Purchas, Mr. Lees, Mr. Lingwood, nor Mr. Ley have any record of it, and the geological formations of the other counties named differ widely from ours.

That the Orchidaceæ are the most interesting of all our native wild flowers is almost a truism. No other class has elicited so much study and research. None others show so much contrivance and design; such adaptations of means to ends. Some of them are extremely sensitive; even the touch of a human hair is enough to cause an immediate response. Wordsworth, "The Poet of Nature," might have been watching an insect visiting a *Listera ovata* or an *O. pyramidalis* when he wrote the well-known lines—

"It is my faith that every flower
Enjoys the air it breathes."

There are peculiarities in the structure of Orchids which distinguish them from all other classes in the floral kingdom. The quaint and curious mimicry of natural objects—from which so many of them take their names—enhances their singularity, and adds not a little to the zest with which the lover of nature searches for them. The most distinguished naturalist of the present century, Professor Darwin, after twenty years of close, sustained, patient study of them, wrote one of the most fascinating books about them. The Duke of Argyll, in his "Reign of Law," commenting upon Darwin's discoveries among the Orchids, observes, "the complication and ingenuity of these contrivances almost exceed belief. 'Moth traps and spring guns set upon these grounds,' might be the motto of these Orchids. There are baits to tempt the nectar-loving Lepidoptera with rich odours exhaled at night, and lustrous colours to shine by day; there are channels of approach along which they are surely guided so as to compel them to pass by certain spots; there are adhesive plasters nicely adjusted to fit their probosces or to catch their brows; there are hair-triggers carefully set in their necessary path, communicating with explosive shells, which project their pollen-stalks with unerring aim upon their bodies. There are, in short, an infinitude of adjustments, for an idea of which I must refer my readers to Mr. Darwin's inimitable powers of observation and description."

But the Orchidaceæ present mysteries as well as wonders. Most of the species which comprise the genus "*Orchis*" exhibit a most curious, and, as yet, unexplained anomaly. They all possess well-developed spur-like nectaries, which seem to imply the secretion of nectar, yet in none of them has the smallest bead of nectar ever been found, even under the microscope. They are favourites with insects, especially the Lepidoptera. Darwin gives a list of twenty-three of these beautiful creatures which he had observed

visiting various Orchids. Why, then, do insects visit them so freely? What is the attraction? Sprengel, knowing the absolute absence of nectar, calls these Orchids, "*Scheinsaftblumen*," or Sham-honey flowers. That is, he believes that these plants exist by an organised system of deception. Darwin vigorously combats such a theory, and retorts, "He who believes in this doctrine must rank very low the instinctive knowledge of many kinds of moths." (page 46). He himself suggested an explanation, but his severely accurate mind was not quite satisfied with it. It remains a study of much interest, and worthy of the study of our entomologists.

Thus it is not only botanists who are interested in our Orchidaceous plants. They possess almost as many attractions for entomologists. Even the most casual observer can scarcely fail to be charmed by their beauty; and those to whom mental effort is a pleasure may find the richest delight in investigating their wondrous mechanism, and trying to solve the mysteries which environ them. But to every lover of nature, and that includes every member of the Woolhope Naturalists' Field Club, they illustrate and emphasise the truth, so finely expressed by Pope—

"All are but parts of one stupendous whole,
Whose body Nature is, and God the soul."

* * * * *

All nature is but art unknown to thee,
All chance, direction which thou canst not see;
All discord, harmony not understood,
All seeming evil, universal good."

"FAMILIAR TREES."

UNDER this title Messrs. Cassell & Co. are now issuing a work by Mr. G. S. Boulger in monthly parts, and judging by the first part now before us it is likely to prove an interesting production. We have little popular and reliable literature in reference to our tree flora, and this renders Mr. Boulger's work the more acceptable, especially as it is well known that he has given much attention to the subject for some time past. It is essentially of a popular character, but much matter of technical interest is also introduced. Two coloured plates are given with the first part, representing an old Oak, and two acorns and Oak apples, the second plate being much more satisfactory than the first, though both are rather better than the majority of these small chromo-lithographs.

The following extract will give an idea of the style adopted:—"Few of our trees have a wider geographical range than the Oak. Whilst the great order of broad-leaved trees to which it belongs, the Cupuliferæ—those, that is, that have their nut-like fruits enclosed in a more or less leafy husk, 'involucre,' or cupule (the cup of the acorn)—is distributed throughout the temperate regions of both hemispheres, the Oaks, of which there are nearly three hundred species, are almost confined to the northern. Many forms are well known to us in our plantations, or by their products, such as the Turkey Oak (*Quercus Cerris*), the Evergreen Oak (*Q. Ilex*), the cork of *Q. Suber*, the galls of *Q. infectoria* and other Levantine species, the kermes from *Q. coccifera*, the cups of *Q. Ægilops* imported as valonia, the quercitron bark of the American *Q. tinctoria*, and that of many other species used in tanning. But as a native of Great Britain we have but one distinct species, though two, if not three well-marked varieties are generally recognised. The English Oak (*Q. Robur*) ranges from the Urals and the Caucasus, from Mount Taurus and Mount Atlas, almost to the Arctic Circle, growing at an altitude of 1350 feet in the Highlands of Scotland; its limit nearly coinciding with that of successful wheat cultivation. Vast forests of Oak covered the greater part of central Europe in the early ages of history. It was the favourite timber of the Greeks and Romans; with it the Northmen built their long ships, and the Anglo-Saxons such churches as that at Greenstead in Essex; and with it was smelted the Sussex iron which supplied the cannon of Elizabeth's navy. When in sheltered situations, or massed together in forests, it may reach a height of from 60 to 100 feet, with a straight stem of from 30 to 40 feet, and a girth which is commonly 8 or 10 feet, though many fine old trees are from three even to seven times that circumference. In exposed situations it is generally shorter and less straight in its growth, and then also has the hardest wood, though this may be rather a characteristic of one of the three varieties than the effect of situation.

"Of these varieties, the White Oak, the *Chêne blanc* of the French (*Q. Robur pedunculata*), is the most abundant in the southern and midland counties. Its leaves have no stalks, and are only downy on the under surface when young; while its flowers, and consequently its acorns also, are generally two or more together on long peduncles. It reaches a less height, but is said to be less liable to the defects known as 'cup' and 'star-shake' than the sessile-fruited varieties.

"These last are commonly united under the names Durmast Oak and *Q. Robur sessiliflora*, which should be applied to distinct forms. They agree in having stalked leaves and stalkless acorns; but the true *Q. sessiliflora* is most abundant in the north and west, its fine straight stems being seen at the best in the Forest of Dean; whilst the true Durmast Oak (*Q. pubescens*) is a dark-fruited variety, occurring in the New Forest, the under surface of the leaves of which remain downy, and stay longer on the tree, hanging in melancholy russet late into the spring. Its timber is of inferior quality, and resembles chestnut in appearance, and, it is said, in being distasteful to spiders. Parts of the roof of Westminster Abbey are said to be of this cobweb-proof material."

THE TAUNTON DEANE SHOW.

IT was in no spirit of flattery that one who has perhaps as great a knowledge of provincial flower shows as anyone in England said at the luncheon

after this year's Exhibition that he knew of no summer show that could compare with that which has been annually held at Taunton, as there is certainly no place where a show is regarded in a more important light than in this beautiful county town of Somerset, where all sorts and conditions of men, from the aristocratic county families to the humblest cottager, consider themselves interested in it, and do their best to make the Show a success. This year was no exception to the rule, nor to that which has, happily for the Society, prevailed for many years—a fine day for the Exhibition. The day before was as bad as well could be—a gale of wind with heavy driving showers of rain; but towards evening it cleared off, the glass rose, and with it the spirits of the Committee and Secretary, and Thursday turned out to be as fine a day as anyone could wish, the perfection of a day for a show—the sun not too hot, a slight breeze and not too much of it, and hence a large and fashionable attendance filled the Vivary Park, where the Exhibition has always been held.

The Exhibition was contained in five tents, one for the open classes of plants and flowers, another for the nurserymen's classes, one for fruit and vegetables, one for cottagers, and one for table decorations, &c. With one exception these tents were all well filled. The Committee had made some alterations in the open classes, and they do not seem to have answered; for although in quality nothing could be finer there were not the same number of exhibitors as in former years—notably last year, when there was an exceptionally grand show. In all other respects the character of the Exhibition was fully maintained. The excellence of some of the plants was remarkable, while unbounded surprise was expressed that in such a season as we have passed through the hardy fruits and vegetables should have been exhibited in such profusion as they were and of such first-rate quality. Especially does the cottagers' tent call for admiration. Not only were there some very pretty designs of flower gardens well worked out, but the vegetables were surprisingly fine and clean. There never were finer indoor fruits exhibited at this Show, while the table decoration of Miss Cypher was, I think, the very best I have ever seen from her, and I have seen a great many of her exquisite arrangements.

In giving an account in detail of the Show, it is impossible that I can do more than note the principal exhibits, and such as I think possess general interest.

In the open class for twelve stove and greenhouse plants in flower, W. Cleave, Esq., of Crediton was first with a very fine group of well-flowered plants, consisting of *Erica amula*, *Allamanda Hendersoni*, *Ixora Duffi*, *Lapageria alba* one mass of bloom, *Erica Marnockiana*, *Dipladenia amabilis*, *Stephanotis floribunda*, *Phenocoma prolifera*, *Lapageria rosea*, *Eucharis amazonica*, *Erica Farriana*, and *Ixora Prince of Orange*. Mr. James Cypher was second, but I imagine his large plants were doing duty elsewhere. In the class for six stove and greenhouse plants in flower Mr. Cypher was first with *Erica Irbyana*, *Allamanda nobilis*, *Ixora Pilgrimi*, *Phenocoma prolifera* Barnesii, *Erica Thompsoni*, and *Statice profusa*. Mr. Cleave was second with *Allamanda nobilis*, *Erica Irbyana*, *Dipladenia amabilis*, *Clerodendron Balfourianum*, *Erica ampullacea*, and *Bougainvillea glabra*. In the class for eight fine-foliage and variegated plants Mr. Cleave was the only exhibitor. He showed some grand plants of *Kentia Belmoreana*, *Croton Weismanni*, *Cycas revoluta*, *Croton Warreni*, *Latania borbonica*, *Croton Williamsi*, and *Areca lutescens*. In the class for four Orchids in bloom Mr. Cypher was the only exhibitor, and had good plants of *Saccolabium Blumei* major, *Cattleya superba*, *Dendrobium Denarii*, and *Laelia purpurata*. In the class for new plants in flower the Rev. H. Dusanay was first with a plant unknown to me—an *Amaryllid* from the Cape having large drooping flowers of salmon-orange, apparently of the same class as *Belladonna*, as the flowers are produced before the leaves. Mr. Cleave was first with *Alocasia Sanderiana*, a very remarkable variety with very deeply cut leaves veined with white.

Zonal Pelargoniums are always exhibited in good form at Taunton; the plants are compact and full of bloom, and do not show so much of the framework by which they are supported as in many places. One exhibitor, however, Mr. H. Geddings, swept the board in both the open and amateur classes. In the class for eight Zonals he showed *Leviathan*, *Lord Gifford*, *White Vesuvius*, *De Lesseps*, *Pioneer*, *Mr. McIntosh*, and *Madame Vancher*. In the class for Nosegays he showed *Emily*, *Bonfire*, *Lizzie*, *David Thomson*, *Minnie Dobbs*, and *Wellington*. In the class for six double Pelargoniums he had *Mons. Langier*, *Wonderful*, *Mill*, *Rambler*, and *C. H. Warren*. Mr. Tollie was an equal first. He also took the prize for the only set exhibited of those now almost obsolete plants the variegated-leaved Pelargoniums—obsolete as far as exhibition plants are concerned, and yet what a furore there was for them at one time. Such are the caprices of fashion. At one time collections in large numbers used to be shown everywhere, but now one rarely sees one put up. Some excellent plants of Begonias were exhibited by Mr. Gedding—viz., *Vesuvius*, *Lady C. Stackpole*, *Mrs. W. Marshall*, *Beaulieu*, *De Lesseps* (double), *Snowdrop* (white), *Wonderful* (very fine), *Mrs. Perin*. A high-coloured variety called *Lady Chesterfield* in the second-prize lot was very fine and deservedly admired. There was as usual a goodly lot of *Petunias*, *Phloxes*, *Cockscombs*, *Azaleas*, &c., but these do not call for any particular remark, save that they were wonderfully fine considering the drought and the scarcity of water, and pass on to those classes which are of more general interest—notably *Roses*, which were very good, considering the time of year and the excessive heat, and were chiefly remarkable for the fact that Messrs. Mack & Son came all the way from Yorkshire to compete. This is reversing what has been the case, the southern growers going northwards, and it is a fair return for them to come south. Of course they were at a disadvantage, as Messrs. Keynes & Co. were so much nearer home, but their exhibits were none the less excellent. Messrs. Keynes, Williams & Co. were first in the class for forty-eight varieties with *Comtesse d'Oxford*, *Madame Nachury*, *Maéchal Vaillant*, *John Hopper*, *Comtesse de Serenye*, *Abel Carrière*, *Star of Waltham*, *Black Prince*, *Baroness Rothschild*, *Charles Darwin*, *François Michelin*, *Alfred Colomb*, *Eugène Verdier*, *Duke of Connaught*, *Madame Hippolyte Jamain*, *Charles Lefebvre*, *Marquise de Castellane*, *A. K. Williams*, *Louis Van Houtte*, *Madame Eugène Verdier*, *Madame Victor Verdier*, *Catherine Soupert*, *Horace Vernet*, *La Reine*, *Camille Bernardin*, *Marguerite de St. Amand*, *Etienne Levet*, *Marie Rady*, *Reine du Midi*, *Sénateur Vaisse*, *Wilson Saunders*, *Ferdinand de Lesseps*, *Madame Marie Verdier*, *Prince Camille de Rohan*, *Barthelemy Joubert*, *Edouard Morren*, *Dr. Andry*,

Queen of Queens, *Wilhelm Krelle*, *Niphetos*, *Baron Hausmann*, *La France*, *Madame Charles Wood*, *Merveille de Lyon*, and *Xavier Olibo*. Messrs. Mack and Sons were second. In the class for twenty-four trebles Messrs. Keynes, Williams & Co. were first, and Dr. Budd of Bath and Messrs. Mack & Son equal second.

Dahlias were not largely but well shown, Messrs. Keynes, Williams and Co. keeping well up the old reputation of the Salisbury firm. In the class for twenty-four they were first with Mrs. Langtry, Imperial, Miss Cannell, seedling, Mr. J. C. Reid, John Hinton, Buttercup, Prince Bismarck, Mrs. P. Laird, seedling, Hope, Mrs. Douglas, Mrs. Rendle, Henry Weston, Lord Chesterfield, F. J. Saltmarsh, James Huntly, Clara, seedling, Mrs. Freeman, Henry Austin, Joseph Ashby, Michael Saunders, and Mr. J. Downie. Mr. Latimer of Staplemore was second. In the class for twelve the same gentlemen took prizes in the same order. Messrs. Keynes, Williams & Co.'s blooms were Miss Cannell, James Oldhis, Mrs. Sefford, seedling, Mrs. Freeman, John Henshaw, Joseph Ashby, Charles Wyatt, Mrs. Dodds, Henry Walton, Hope, and Falcon. In the class for twelve Fancies the same exhibitors occupied the same position. Messrs. Keynes, Williams & Co.'s flowers were Peacock, seedling, Rev. J. M. B. Camm, seedling, Madame Joubert, Gaiety, Professor Fawcett, Chorister, Charles Wyatt, Mrs. Saunders, and Henry Eckford.

Gladioli are always a grand feature of the Taunton Show, for the greatest of *Gladioli* growers live in the neighbourhood—Messrs. Kelway & Son, *facile princeps* of all professional growers; in fact there is no one in England that comes within a long distance of him both in the extent of his culture; and Mr. Dobree of Wellington, who is without doubt the largest and most successful amateur that we have and the raiser of a number of good seedlings. Messrs. Kelway & Son exhibited a grand stand of 100 blooms not for competition, amongst which were some new varieties, for a few of which certificates were awarded—notably Earl of Idlesleigh and Prince Henry. Mr. Dobree was the only competitor in the class for twenty-four, and he besides exhibited a beautiful collection of 100 varieties. How very much more forward, by-the-by, are they in Somerset to us in the east of England. I have not got a dozen in bloom in my own garden. As Mr. Dobree is so successful a cultivator I give the names of the varieties shown:—*Glory of Plymouth*, *Carnation* (flaky white, tinted carmine at edges), **Madame Dobree*, **King of Scarlets* (a remarkably bright flower with white centre), **Helen Masterman*, **Pied Crow*, **Mrs. Knowley*, *Adolphe Brongniart* (rose-tinted orange with large white spot), *Belgique*, **Queen of Crimsons*, *Giffard*, *Orphée* (rosy white flaked with carmine), *Horace Vernet* (brilliant purple, red centre, feathered red), *Eugène Scribe*, *La Perle* (rosy lilac, blotched violet carmine), **Vicar of Westwell* (this was awarded a first-class certificate, as also **William Kelway*, both of these are compact well-formed flowers), *Mecenas*, *Prosper Laugier*, *Bellona*, **Maggie* (white, tinged at edges with purplish crimson, and distinctly marked on the lower petal with the same colour, a flower of great substance), and C. W. Bullmer, those marked * being his own seedlings.

Passing now to the amateur tent we find, as might naturally be expected, that Mr. Cleave takes the first place. In twelve stove and greenhouse plants he had the following in admirable condition:—*Ixora Prince of Orange*, *Phenocoma prolifera* Barnesi, *Allamanda Hendersoni*, *Statice Holfordi*, *Erica ampullacea* Barnesi, *Anthurium Scherzerianum*, *Clerodendron Balfourianum*, *Ixora Colei*, *Allamanda grandiflora*, *Erica Lindleyana*, *Bougainvillea glabra*, and *Erica Aitoni*. In the class for six stove and greenhouse plants Mr. Wilfrid Marshall was first with good plants of *Clerodendron Balfourianum*, *Ixora Mooreana*, *Anthurium Andreanum* very good, *Rondeletia speciosa*, and *Ixora Prince of Orange*. In the class for four stove and greenhouse plants Mr. Cleave was again first with *Clerodendron Balfourianum*, *Erica tricolor* Wilsoni, *Bougainvillea glabra*, and *Ixora Williamsi*. Mr. W. G. Marshall was second. Mr. Cleave was also first with *Allamanda grandiflora*, *Bougainvillea glabra*, and *Clerodendron Balfourianum*. In the class for six foliage Mr. Cleave was again first. His best plants were *Crotons* *Krelagei* and *Prince of Wales*, *Alocasia Lowi*. In the class for six exotic Ferns Mr. Cleave was first with fine plants of *Davallia Turneri*, *Adiantum trapeziforme*, *Adiantum Sanctæ Catherineæ*, *Gleichenia Mendelli*, *Adiantum concinnum latum*, *Gleichenia rupestris glauca*, and *Adiantum gracillimum*. In hardy Ferns Mr. Cleave was also first with fine plants of *Lastrea cristata*, *Scolopendrium vulgare crispum*, *Lastrea Filix-mas cristata*, *Adiantum Capillus-Veneris*, *Athyrium Filix-femina plumosum*, *Polystichum Woolastonii*, and *Athyrium Filix-femina Fieldiæ*. F. W. Newton, Esq., of Barton Grange, was second with excellent plants of nearly equal merit.

In the class for twenty-four cut *Roses* Dr. Budd of Bath was first with good examples for the time of year of *John Hopper*, *Baroness Rothschild*, *Henrich Schultheis*, *Captain Christy*, *Countess of Rosebery*, *Queen of Queens*, *Madame E. Verdier*, *Marie Baumann*, *Bouquet d'Or*, *Duchess of Bedford*, *Ulrich Brunner*, *Charles Lefebvre*, *Comtesse de Serenye*, *Alfred Colomb*, *Merveille de Lyon*, *Dupuy Jamain*, *Marie Van Houtte*, *Duke of Wellington*, *Marie Verdier*, *Comtesse d'Oxford*, *Madame Isaac Periere*, *Avocat Du Rivier*, and *Madame Lambert*. He also was first for twelves with *Fisher Holmes*, *Madame E. Verdier*, *Duchess of Bedford*, *Etienne Levet*, *Charles Lefebvre*, *Marquise de Castellane*, *Duke of Wellington*, *Madame Georges Schwartz*, *Marie Baumann*, and *Merveille de Lyon*; also in Teas, not less than six varieties, with but indifferent examples of *Souvenir d'Elise*, *Rubens*, *Marie Van Houtte*, *Caroline Knster*, *Comtesse Riza du Parc*, and *Perle des Jardins*.

There were but two small entries for *Gladioli*, and to these were awarded equal first prizes, although many saw a vast superiority in Mr. Dobree's, which consisted of *Glory of Plymouth*, *Adolphe Brongniart*, *La Perle*, *George J. Fox*, *Countess*, and *Millie Dobree*.

Table decorations were not many in number; but although I have seen many of Miss Cypher's achievements in this line, she never set up a more beautiful one than that which she arranged for this Show. To those who condemn the high stands of course it would be objectionable; but nothing could, I conceive, be more elegant than this arranged (as she knows so well how to do it) with *Francoa ramosa*, *Gloriosa superba*, *Water Lilies*, *Eucharis*, &c., the other two middle pieces being *Cocos Weddelliana*, about 18 inches high, with *Water Lilies*, &c., arranged around the base. Small plants of the same *Palm* about 8 inches high were placed in ornamental square pots at either end, and there were some pretty small trays of flowers

and good fruit made a most charming combination. She was also first in table stands and bouquets.

The town did not display the decorations it used to do in former years, when prizes were given for the best street decorations; but much was done to make it bright and pleasant. One good man had, however, displayed a device near the station with words which speak more for his loyalty to his county than to his poetic genius—

"Welcome to fair Somerset,
The glory of the West;
Welcome to old Taunton town,
Whose Flower Show is the best!"

All the arrangements were carried out with their usual completeness by the active Committee, aided by their popular and indefatigable Secretary, Mr. C. W. Samson, and I am glad to say it was a great financial success. Upwards of £350 was taken at the gates, and thus this excellent annual Show holds its own amongst those of the West of England. May it long do so.—D., Deal.

FRUIT AND VEGETABLES.—With the exception of hardy fruits there was no diminution in the quantity of fruit in the various classes provided, and the quality on the whole was equal to what is usually staged at this Show. The best collection of ten dishes was staged by Mr. W. Iggulden, gardener to the Earl of Cork, Marston House, Frome, and comprised very good Black Hamburgh and fairly good Muscat of Alexandria Grapes, a good Pine Apple, Eastnor Castle Melon, Mignonne Peaches, Lord Napier Nectarine, Brown Turkey Figs, Morellos, Apricots, and Jargonelle Pears. Mr. Crossman, gardener to J. Bruton, Esq., Yeovil, was a fairly good second, his collection including very good Black Alicante Grapes and Pine Apple Nectarines. The latter exhibitor was first with eight dishes, staging good Muscat of Alexandria and Black Hamburgh Grapes, Victory of Bath Melon, Pittmaston Orange Nectarines, Apricots, &c.; and Mr. J. Reed, gardener to F. J. C. Parsons, Esq., was second in this class. Several exhibitors staged excellent collections of four dishes, Mr. Iggulden being first with good Black Hamburgh Grapes, Hero of Lockinge Melon, Crimson Galande Peaches, and Pine Apple Nectarines. Mr. W. Daffern, gardener to Mrs. Walker, Weston-super-Mare, was a close second; and Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., third, the latter being rather hardly used. Several good stands of Black Hamburgh were shown; but Mr. Iggulden was easily first with medium-sized very compact bunches, the berries being large and well coloured. Mr. A. Cooper, gardener to C. L. Collard, Esq., was second; and Mr. J. C. Clarke, gardener to C. E. J. Esdale, Esq., Cothelstone, was third. In the class for any other black Grape Mr. Cooper was first with large well finished bunches of Black Alicante, Mr. Daffern following with handsome but not well-coloured examples of Madresfield Court, and Mr. Crossman was third with the same variety in excellent condition, many growers in fact considering these should have been put first. Mr. J. Lloyd was first for three highly creditable bunches of Muscat of Alexandria, the second prize going to Mr. W. C. Raffett, and there were other good lots staged, and some very green indeed. Mr. Raffett took the lead in the class for any other white variety, staging Golden Champion in very good condition, and the same exhibitor was apparently the winner of the second prize. Melons were not particularly good, and the Judges acted very strangely when making their awards, two at least of the fruit not being tested. Mr. T. Panll was first with Hero of Lockinge; and Mr. W. Perriman, gardener to G. Ricks, Esq., second with Blenheim Orange. Peaches were scarcely so plentiful as usual, but there were several good lots included. Mr. Iggulden was first with a fine dish of Royal George, and Mr. Lloyd second with Grosse Mignonne in good condition. With Nectarines Mr. Daffern was first with highly coloured but scarcely ripe Newington, Mr. Crossman following with very handsome well ripened Pittmaston Orange. A fine dish of Lord Napier was passed over, the Judges did not like the colour. Mr. H. Godding had the best Apricots, and Mr. Iggulden was first with Morello Cherries. Plums and Pears were not well shown, but there were many fine dishes of Currants, Gooseberries, and Apples.

Vegetables were less numerous than usual, but on the whole were surprisingly good, notably the two first-prize collections of ten and six dishes shown by Mr. T. Frost, who had very fine Tender and True Cucumbers, Telegraph Peas, Intermediate Carrots, Runner Beans, Woodstock Kidney Potatoes, Autumn Giant Cauliflowers, Brown Globe Artichokes, President Garfield Tomatoes, and Tripoli Onions. This exhibitor was also successful in the various classes for single dishes of vegetables. The Taunton district has been very unlucky with respect to rainfall, some of the gardeners asserting that but little has fallen since March; but in spite of this they succeeded in showing very fine examples of such Potatoes as Vicar of Lealeham, Woodstock Kidney, Reading Russet, Schoolmaster, International, Cosmopolitan, and other equally well-known sorts, and the Celery, Cauliflowers, Onions, Carrots, and Beans were also very fine.

ALLAMANDAS PLANTED OUT.

THIS, in my opinion, is the most satisfactory way to grow Allamandas when the object is either to secure cut flowers or embellish the roof or wall of a house. For exhibition it is, of course, necessary that they should be grown in pots, and at certain times in these they make a good display; but I have not yet seen a pot plant produce such huge quantities of bloom and such a long and constant succession of it as plants which were turned out of the pots, put into a good bed of soil, and allowed full freedom. Treated in this way, I consider the Allamanda the most useful stove-flowering plant we possess. It begins to open its flowers in an ordinary cucumber pit or plant stove in May, and does not cease until October or November. One plant placed at the end of a cucumber pit here two years ago has covered a large space of brick wall and a good piece of the roof at the back, and we can gather some dozens of blooms from it daily. It has been in blossom for three months, and has more buds on it now than ever. Its rooting space is about 3 feet square, 1 foot deep, and the compost consists of rough loam, peat, and sand. At this season it receives large quantities of liquid manure, and water is given liberally. In the autumn it will be cut back, but not quite so much as some recommend.—J. MUIR, Margam.

KITCHEN GARDEN.

SINCE our last notes appeared the aspect of the kitchen garden has been considerably changed. Many rows of Peas have had the seed pods gathered from them and the straw cleared away. Midsummer Cauliflower stumps have been pulled up. Turnips which had become too old are in the rubbish heap; old Broad Beans have followed, and in about three days everything of no further use was cleared out. In cases where the soil was well manured before the last planting it was only hoed and raked after the crops were removed before being ready for a succession, but where the soil was poor manure was given, and either forked or dug in. It is a mistake to manure after every crop, as well as it is to take crop after crop without any manure. We only apply manure once a year, no matter how many crops we may manage to take.

CABBAGE.—Clear all the dead leaves and weeds from between the old plants, which headed some time ago and are now being left to form late sprouts. Plant a good patch out from the young batch raised from seed sown three or four weeks ago. These will form tender sweet little heads in November and December, and be very acceptable then. Sow more seed of varieties to plant out in September and form heads early next spring. In mild early districts late sowing is the best for these, while in cold backward localities the end of July or early in August is the right time to sow. The seed may either be sown in rows or broadcast, and not too thickly in any case. The soil should be rich and capable of producing strong plants and plenty of robust roots. The position should be out in the sun and away from all shade, as drawn-up plants are never satisfactory; they cannot be too dwarf or sturdy. We know no crop of more importance than the spring Cabbages are, and to make sure of having plenty of plants and produce at the right time seed should be sown twice or three times. Some sow their Cabbage seed on a certain date annually, but we do not believe in this altogether, as the variations in the weather, especially in winter and spring, can only be met properly by having an early and a late hatch of plants. Some seasons we have found all our early August-sown plants run to flower before March was over, and the early September ones were those which came in properly. This, to a great extent, is a question of climate and situation.

CARROTS.—No year passes without many of these failing, and we hear of many plantations which were very promising at one time dying almost wholesale. Happily ours are not included amongst these. About a month ago a small white fly took possession of the foliage, and they looked bad for a little while; but we mixed a quantity of soot and salt and gave them a good dusting with this, and now they are as healthy and green in the foliage as possible. In cases where failure has occurred, or where the Carrot crop is likely to be short, a good sowing of the Early English or French Horn should be made. We sow largely at this time in order to have a supply of tender young roots during the autumn, and we find them very much valued and useful. Insects are not so troublesome in the autumn as in the summer, and autumn-sown Carrots rarely fail. They should be sown in good clean soil in rows 15 inches or so apart, and about 2 inches below the surface.

WINTER GREENS.—Dry weather or other circumstances may have prevented some of our readers planting out the whole of their Broccoli, Savoys, and other crops, but the work must not on any account be delayed if profitable crops are desired. It is too late to plant Brussels Sprouts, and the other kinds of greens will not become so strong and remunerative as those planted a month or more ago. Any that can be lifted with good roots should be planted in this way.

CELERY.—The earliest plantation of this should be earthed up. It is best to allow the plants to grow a good size before earthing, then it must be done every fortnight or three weeks until no more earthing is required. The dwarf outside leaves should be taken off at first, and the soil be well broken along the margins with the spade, and then draw it in between the plants and press it round the stems with the hands. A piece of matting may be tied round each plant before earthing begins to keep the leaves close together, and prevent the soil from falling into the centre, which is the main point to avoid. The matting should be taken off when the work is completed, and they may be tied up each time earthing is done. Where there is any chance of worms disfiguring the stems the plants should be dusted with a quantity of soot before earthing. Keep late Celery crops quite free from weeds, and water copiously if there is any chance of their being injured by excessive drought. Plants which were left in the nursery beds may be used to fill blanks, and the surplus ones can be planted in new trenches to come in late. If trenches cannot be made for them they may be planted anywhere, as the leaves will be useful for flavouring.

HERBS.—These are in demand all the year round, and a good supply in a dry state in winter is as necessary as it is to have plenty of green ones in summer. The drying should now receive attention. Mint, Sage, Thyme, and the Winter Savory are a few of those things which must be dried in large quantities. Cut them on a dry day, secure flowerless shoots, and spread them out in an open shed to dry. Do not lay them in the sun, as this will wither them too much, and they must be turned over every other day until they are dry, when they may be tied in bundles and hung up in any room or kitchen.

ENDIVE AND LETTUCE.—Continue to plant out large quantities of these for late autumn and winter use. Give them good soil, a dry sunny open position, and keep all from 10 inches to 1 foot apart each way. Where Chicory has failed or has not yet been sown, sow a quantity at once, as it is an excellent companion to the Endive and Lettuce. It is not over-particular to soil or situation, the odd corners in the garden very often producing fine roots, which are lifted and forced in a dark place throughout the winter.

ONIONS.—Remove all weeds and anything which is obstructing the sun from the spring-sown crops, which are now gaining maturity. Clear off last autumn-sown crops, and save any good sound bulbs for immediate use. A small quantity of The Queen, or some other white variety, should be sown to produce the earliest bulbs next spring. Sow in rows in soil that is free from worms and moderately rich. A sunny position is much better for them than a shady one.

FRUIT FORCING.

FIGS.—*Early-forced Trees.*—When the trees have been cleared of the second crop of fruit they will require cool dry treatment to insure the proper ripening of the young shoots, and when this has been secured the roof lights may be taken off for a few weeks, and any repairs, painting, &c., executed. The exposure to night dew and rain is a powerful aid in cleaning the trees. As a collection of the best Figs for early forcing we find none to surpass Brown Turkey, Osborn's Prolific, Negro Largo, and White Marseilles.

Succession Houses.—Trees on which the second crop is now ripening will require careful treatment as the days decrease in length and the nights become damp and cold. The fruit should have full exposure to light, which, with a free circulation of dry warm air by night as well as day, will improve the colour and quality of the fruit, but care must be taken not to give a check to the roots and so interfere with the flow of the sap; therefore, the roots must be regularly supplied with tepid water or liquid manure, selecting bright mornings as the most suitable time for applying it, as the liberal admission of air will then carry off superfluous moisture, which otherwise will condense and injure the fruits. As the growths which have reached the extremities of the trellis and become clear of fruit, and successions require more room, the former may be cut away, which will admit light and air, to the great benefit of next year's fruiting growths. The growths should not be tied in close, but allowed to grow upward, as this favours the ripening of the points.

Cucumbers.—The house into which winter Cucumbers are to be planted must be thoroughly cleaned. The woodwork may be washed with soft soap and hot water, and the glass with clear water only, the brickwork and plaster, if any, with hot lime, and any painting needed should be done without delay. It is no use expecting healthy plants without thorough cleanliness, and insects are encouraged by dirt and ill-health. Examine the drainage and see that it is perfect before putting in the compost, which should be composed of three parts light loam and one part peat, with sufficient charcoal to keep the whole porous, or about a tenth. In this material well incorporated the plants will thrive much better than when manure is added, and stimulants can always be applied in a liquid state as the plants require it. A dry day should be chosen for getting in the materials, the drainage having been covered with turves grass side downwards. The soil should be made into a ridge in the centre of the pit or space allotted for the bed, and formed into hillocks flattened at the top, the soil being a foot thick in the centre. The seeds having been sown as advised in a former calendar, and the treatment there given accorded, the plants will be fit for planting on the hillocks at the end of this month, or they may be shifted into the pots or boxes if that mode of culture is practised. The plants having been watered some time previously to planting out, they should be turned out with the ball entire, and have their roots disturbed as little as possible. Press the soil firmly around each plant, after which a small stick should be placed to each and secured to the first wire of the trellis. Should the sun be bright at the time of placing the plants shade for a few days until they become established, when it should be discontinued. Encourage a sturdy, short-jointed growth, and thick leathery foliage, by ventilating freely on all favourable occasions, as the plants need all possible vigour to enable them to afford fruit at the most trying period of the year—viz., December and January.

PLANT HOUSES.

Calanthes.—The earliest batch of these plants should now be strong, with their pots well filled with roots, and in order to further develop them liberal and judicious feeding must be resorted to. Weak stimulants should be given every time they need water, nothing being better for them than liquid made from cow manure. Abundance of water must be given to these plants, and for some time the soil in which they are growing must not be allowed to be dry. Any deficiency in this respect will soon bring their roots into an inactive condition, and premature ripening will be the result. Syringing should still be freely practised, and the atmosphere kept moist, but more air must be given them than has been necessary up to the present. Shading will still be required, but the strong rays of the sun only should be screened from them. Light, air, and liberal feeding are necessary for developing large, well-matured pseudo-bulbs, which in due time will yield strong stout flower spikes. Later batches started in small pots should, without further delay, be placed into a size larger and treated carefully afterwards, until they are rooting freely into the new soil. A close warm atmosphere must be maintained for batches in a backward condition, and every ray of light possible given them. Under the most judicious system of treatment it is impossible for those grown for late flowering to produce such good

flower spikes as those started earlier in the season. The pseudo-bulbs of the late-started plants have not the same chance of ripening thoroughly, and therefore every attention must be given them, for unless this is accomplished they cannot be expected to flower well. They are, however, worthy of all the labour and care necessary to grow them for the purpose of coming into flower after Christmas, when many autumn-flowering plants have ceased to bloom. Hitherto we have found the late batch more serviceable than those that flower two months earlier, and they should be grown by all who are anxious to maintain a continuous supply of flowers for cutting and decoration.

Phajus grandifolius.—These plants will now be growing vigorously and rooting freely. Every attention as regards watering and feeding must be bestowed upon them to insure a strong robust growth if fine large spikes are required. Syringing may be practised during bright weather, and every ray of light possible admitted to them. It is much better to produce under the influence of light and a circulation of air a strong sturdy growth than to draw up the foliage weakly under heavy shade, and in a close confined atmosphere. Sturdy compact growth will always produce the strongest and finest flower spikes. The liquid recommended for Calanthes will suit these plants well, but their foliage will be much improved in appearance by occasional doses of soot water in a clear state.

Cattleyas.—C. Mossiae and C. Trianae that flowered early will have completed their growth, and should be removed at once to the coolest end of the structure. To flower these plants well, and to obtain afterwards a good growth development, they must be thoroughly ripened. More air and light must be given than has been needed up to the present time to ripen and solidify the pseudo-bulbs made, and then large well-coloured flowers may be anticipated. The supply of water at the roots must not be diminished, for at this stage they are most active, and must be encouraged in order to further plump up the pseudo-bulbs. The atmosphere must also be kept moist. Later-flowering varieties must be encouraged to complete their growth as early in autumn as possible, for nothing is gained by having to ripen them during short dark sunless days. Such plants, however well they be rested, very rarely flower satisfactorily. The growth of the plants can be much forwarded by closing the house a little earlier during sunny days, and using a little more fire heat both at night and during cloudy sunless weather. These plants bear without injury a close atmosphere until the flower sheaths are visible, when more heat and light are of the utmost importance.

Dendrobium Wardianum.—This Orchid naturally starts into growth early in the season, and if grown suspended in the stove proper they will have completed their growth and must be removed without delay, or else they will break again into growth, which cannot be thoroughly ripened, and will only damp during the resting season. This can be avoided by removing them to a vinery or other cooler structure where plenty of light and air can be given them. In a very short time they will bear full exposure to the sun and the conditions of a cold house. Plenty of water must be given them for some time yet, or the pseudo-bulbs will ripen prematurely and fail to flower from every joint of their growth, which will be the case if gradually and thoroughly ripened.

THE BEE-KEEPER.

NOTES ON BEES.

DURING the month of September, 1884, I arranged my hives to stand the winter and spring, marking those I wished to swarm and those not. Not only have I had my wishes fulfilled, but notwithstanding the very untoward and cold season they have done well—far beyond my expectations. The only stinging days the bees have had this year since April was the last week of June and from the 20th to the 29th of July, with two wet days during that time. At present my hives will have stored about 70 lbs. of surplus honey; with a continuance of this fine weather for another week each should yield 100 lbs. The crossed Cyprians are this year again far ahead of the others. A stock that swarmed has given as much as non-swarmers, while the swarm promises the same. I neither fed nor manipulated, except feeding the swarms a little, dividing hives for young queens, putting on supers. I clean no floors, because my hives do not require it, having ventilating floors.

The following are the casualties that have occurred in my apiary:—First, a two-year-old queen was deposed at the end of April; a nucleus kept over winter was joined and put matters right. Second, a super placed on a hive with frames all open at the top contained brood. This was intended to illustrate what I was sure would happen, and is the second super only that contained brood during my bee-keeping life. The third was a hive that I neglected to ventilate, and one warm rainy day last week one comb collapsed; next day it,

along with a super, was removed, and the brokendown comb sent to an invalid who desired a piece of honeycomb. There was, in my opinion, another cause for the comb falling. It was made from a sheet of thicker foundation than I care about using, as I consider thick sheets make the comb more brittle than thin ones do. When the bees work up the surplus wax the comb is more brittle than when extended from thin ones, or when made wholly by the bees. My supers, with the one exception, are first-class, and mostly of worker comb, which is decidedly prettier and more marketable than drone comb. Some tell us that drone comb is "store comb," but if that was the case why do the bees not adhere to the rule? My bees have never attempted to lie out this warm and fine weather.

Young queens, roomy and well-ventilated hives, together with the supers being kept well covered, and avoiding all unnecessary manipulation, are the direct causes of my success. For ease and neatness in putting on and taking off the supers the Stewartons are excellent. In them all crowding on the top of frames when removing supers and stinging is avoided. I draw slide after slide of super, slip in the carbolicised paper as each is removed, then push in slides in one beneath, and no bees annoy you. The lateral slides have not this advantage; but then the bees do not crowd the top of hives fitted with them, and a little acid clears all down.

The best frame hive is undoubtedly the deep compound frame hive; with its reversible ventilating and feeding floor and frame feeder, movable porch and improved hiving box, it is the most perfect hive made. With such a hive, measuring only 17 inches across and light, they are admirably adapted for moving about, while it possesses that grand feature of the Stewarton—having depth in body, and a depth of honey between the brood nest and super is the great secret of having pure comb. With such hives there is need for nothing to prevent the queen ascending nor bees crowding the tops of frames, nor any fear of blackened combs, as is the case with shallow frames where the brood is close to the supers. My little apiary giving so much satisfaction is not only cheering to me, but will, I hope, be encouraging to others. There are many bees near me, and if your bee-keeping readers reverse the foregoing picture they will have an idea what they are like. Good management has this year given abundance of honey, but where the management has been different with the variable season the result is the same.

FOREIGN VARIETIES OF BEES.

The introduction of foreign varieties of bees and their crosses has necessitated changes in their management. Their tempers, too, are greatly changed from the aboriginal black bee, so much with some varieties and crosses that bee-keeping to many is an annoyance instead of a pleasure. Had the Bee-keepers' Association turned their attention toward the introduction of mild-tempered bees it would have been more to their credit than fixing standard appliances with a great amount of compulsion on bee-keepers to adopt them, imperfect though they be. In consequence of many imported Ligurian bees showing both temper and markings of the Cyprian bees, together with an impaired constitution consequent on raising queens from weak hives, they fail to give the satisfaction they did when first imported. The Carniolian bees are not only good honey gatherers and good breeders, but are very mild tempered and hardy, requiring neither smoke, carbolic acid nor veil when manipulating. Their only fault is the long time they fly when swarming, and their strong inclination to return to the place they alighted on if at all roughly handled. Second or after swarms, by having a great many queens, are troublesome, clustering sometimes in a dozen places, and will send off a swarm from two or three combs with full scope of hive. The Cyprians and Syrians are liable to do the same, but are no exception to the old race, and but prove that giving room while young queens have been neglected will not prevent swarming.

Owing to the erratic movements of Carniolians I find it not only an advantage but a necessity to employ a hiving

box in all cases. I think the mild-tempered Carniolians will not enter other hives and kill their queens, but other races do. Therefore the hiving box used with them is desirable, as when a swarm of bees is shaken on to the front or top of the hive many take wing, entering other hives, killing the queens there, notwithstanding the confidence the operator may have that all is right. It is a good feature in the Carniolian bee raising so many queens and then separating them into small swarms, as it gives the apiarian a great advantage in having plenty of young queens on hand. The Carniolian bees are great flyers, and go long distances for forage, so that advantage overcomes the fault of flying long when swarming. One hive of bees that swarmed this year flew for nearly three hours before they clustered, and after they did so we had a great difficulty, owing to the bees being tired, to gather them in, consequently many were left behind. While on their way back to the old site a neighbour's hive swarmed, and quick as thought they flew towards the swarm, but not more than a dozen would join the swarm, so we cut the twig containing the cluster, joining them with sister swarm, and they were much easier to manipulate then.

THE SYRIAN BEES.

These bees I have already given an account of up till swarming time, the only fault noticeable, like the Cyprians, being their tenderness during winter. Their high bugle-like buzz when on the wing made them very charming. During the low temperature I had no difficulty with them, but a change of the weather brought a change over them. They swarmed, and while doing so lost their queen and became vicious, entering other hives. Thinking the queen might still be in the hive I divided it into five, but failed to find her. Many bee-keepers can but have a faint idea of the number of bees in a swarm of these bees, making it a great difficulty to find a queen. The ones occupying the old site, and which had the most bees and the one likely to have the queen, I excised all royal cells, as they were building worker and no drone comb. I expected to find her all right next day, but judge of my surprise that the newly-made worker comb contained upwards of a hundred empty queen cells, a proof that the queen was not there, and a still better proof that bees do not shift eggs from one cell to another, and bees had never a better opportunity than in this case. The other four were examined with the same result—building worker comb, a case without parallel in our native bees. During these manipulations, which were all performed in a cautious manner, the bees stung my hands dreadfully, entered my pockets and shoes, stinging me in the feet through my stockings. They also went over the hedge, and stung one who had been stung well every year for sixty years, thus negating by ocular demonstration the inoculation theory. Thanks for a German mask sent me by Mr. A. Neighbour my face was not stung, but my hands were, and swelled very much—quite a new thing for me; besides, there was much pain. If the operator could keep perfectly steady and calm he would escape many stings, but the slightest shake of the hand irritates them to the attack. Had they confined their stinging to those in or about the apiary I would have been more hopeful and less sorry; but they attacked people on the public road a long way from their hive, and entered dwelling houses and stung people there. Simultaneous with this stinging and the thermometer standing at from 70° to 84° in the shade, and the height of the honey season, they attacked my strongest Carniolian hive, carrying unmolested its honey away as fast as the latter carried it in, impressing me with the truth of the one in America that gathered 1000 lbs. last season.

The stinging and robbing had to be stopped, and I acted as judge and jury, sentencing them to be imprisoned without either bread or water for five days, being the expiry of my present engagements. Their incarceration during so high a temperature would have proved fatal, but good ventilation kept them comfortable, but evidently not quiet. Every one of them set to work and proved themselves as good prison-

breakers as they were thieves. The whole of them in a very short time had reduced the slide of their doorway an eighth of an inch, while one of them actually pushed aside a board on the top of the frames 18 inches long by 5 broad and three-eighths thick, and made their escape, while another pushed a half inch slide mouthpiece aside and commenced their robbing and stinging with renewed vigour. Being sorry to see honest bees robbed by the brigands, I passed a new sentence and carried it into effect, and had them banished several miles from any hives amidst Clover fields, profuse in flower and aroma, and a paradise for both man and bees. On being released from their hive they attacked me again, which I would not have cared for but they caused a lot of workers in a hay field to make a hasty retreat, as I did myself to escape a reprimand and be a witness to seeing the whole of them being toppled into the rivulet from its brink on which they stand. Many of these Syrians were left behind which have entered other hives, and I am sorry to say these refugees are in no way altered, stinging and robbing as they did when in their own hives. Everybody concerned who experienced their stings believe they are banished for ever. The Cyprians I could manage, but the Syrians are unmanageable.—A LANARKSHIRE BEE-KEEPER.

BEEs TAKING TO AN EMPTY HIVE.

IN your Journal of September 25th, 1884, you inserted a letter from me, describing the entrance arrangements and positions of the hives in my bee-house. My hives are placed two together; the one contains bees during the winter, and the other is placed on one side of it to receive the swarm or swarms which may come from it during the summer. The two hives are joined together in the autumn, and in this way I always keep the same number of hives in winter, and I make a point of keeping them very strong.

All the hives except two have a south-east exposure. These two face the north-west. One only is occupied in winter. The bees having the south-east exposure swarm regularly about ten days earlier—namely, about the middle of June. In the early spring the north-west hive is the strongest, and it certainly yields more honey in autumn. In 1883 it did not swarm at all. In 1884 it swarmed once, and in 1885 it threw off three swarms (two in one day), but all returned back to the stock hive within an hour.

My bees have not swarmed this year with the same vigour as usual. The swarms, though good, did not empty the stock hives in the same way. It was sometimes difficult to tell which hive had swarmed. The swarms generally were late; the weather was cold and must have interfered with the breeding, but when the weather improved the bees recovered rapidly, and the district report is that this is an exceptionally good year for honey. My hive exposed to the north-west is, however, very strong, having all its bees in it. It has nearly filled a large super, but, in addition to that, a large part of its population, including a good number of drones, took possession of the adjoining hive night and day. They have made a good deal of honey and comb about 10 lbs., and have deposited in two of the frames a good deal of bee bread. The entrances to the two hives are 2 feet 6 inches apart, and the entrance to the empty hive was partially obscured by long grass, which, had a swarm been in it, would have been kept short.

The weather is now colder, and the bees at night are in the stock hive only, but are as busy as ever in the adjoining hive in the day. This proceeding, as far as my experience goes, is very unusual.—A DUMFRIESHIRE BEE-KEEPER.

SUPERS v. SECTIONS.

IN your issue of this week "A Lanarkshire Bee-keeper" takes great trouble to prove that bees prefer ordinary supers to sections. This no experienced bee-keeper will deny; but when he tries to show that honey is more saleable in the supers I think most bee-keepers will disagree with him, and, in fact, the contrary is proved by the large increase in the number of sections sold by the hive dealers. In Ireland I know that sections will command 1s. per lb. wholesale when large supers cannot be sold at all to dealers except at the same rate as skep honey, which is about 6d. to 8d. per lb. wholesale, and sometimes less, and many grocers deal in sections who would have nothing to do with supers or honey that would have to be cut up for sale.—Co. WICKLOW.

BEEs—SHORT NOTES.

MY experience of bees extends to only a few months. I write this in anticipation of advice being given by your experienced correspondents. Why is open driving, as recommended by "Modern Bee-keeping," superior to close driving? I went to an agricultural show in which there was a bee tent, and an expert was there driving bees on the open system. At that time I had a stock hive in a straw skep I wished to take the honey from, so on arrival home I commenced driving on the system just

seen. I was heating from 7 P.M. to 9.30; then I placed the driven bees on the old stand. The next day they did not seem to be settled, and it was quite evident the queen was not there, so I inverted the stock again, and recommenced driving, and was beating for more than an hour, when a brother bee-keeper came in, and told me to place the edges of the two hives together, and then heat. In about ten minutes I carried the upper hive to its old stand, the bees went rapidly into it, therefore I concluded the queen was in. Does not this show that close is superior to open driving? at any rate, it is in saving time. As to seeing her majesty going up, is it of much consequence if we can judge fairly correctly if she has gone up, by the scarcity of bees in the lower hive?

I half emptied the above skep of comb and honey, and I am now giving 4 lbs. of sugar made into syrup by boiling with one quart of water and a little salt and vinegar. Will that quantity be sufficient to last them safely through winter, together with what they gather from August 7th in this, a pastoral district, with no Heather? What kind of sugar is the most economical to feed them with?

I have a strong swarm of June 4th, 1885, in a nine-bar frame hive. I have fourteen 1 lb. sections on the comb is worked out in them (August 11th). I intend taking them off on September 1st, together with one bar from each side of body of hive; the dummies, one on each side, will then be drawn close to the seven remaining bars, leaving 1½ or 2 inches between them and the sides of the hives, which space will be filled with sawdust. Is it probable that the bees will winter well on the few remaining bars without feeding? Here is another question. I have seen bee-keepers use cushions made of chaff, &c. Surely they cannot be so warm (or rather non-conducting) as hives packed with loose material, as chaff, corkdust, &c., for when made into cushions they are of a form which favours a circulation of air around them, therefore losing a great deal of heat.—A YORKSHIRE BEE-KEEPER.

TRADE CATALOGUES RECEIVED.

Ant. Roozen & Son, Overveen, near Haarlem, Holland.—*Catalogue of Dutch Bulbs for 1885.*

Viccars Collyer & Co., Leicester.—*Catalogue of Floral Gems.*

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Boxes for Chrysanthemums (N. F.).—We have received your letter and the subject shall not be overlooked.

Seedling Plum (A. C.).—If this is known to be a seedling recently raised it is too much like the Denbigh Plum to be cultivated as a distinct variety.

Removing Greenhouse Lights (E. T.).—If we understand the case rightly we think the lights must remain, as they could not be taken away without damaging the property of the next owner of the estate. The case, however, is peculiar, and before proceeding in the matter you had better consult a solicitor. It is a great pleasure to us to learn that you find the Journal so satisfactory after having read it for so many years. You rank among the oldest of our subscribers, and we thank you for your appreciative letter.

Destroying Ants (E. B.).—Your plan is not so "new and novel" as you suppose it to be, for some years ago a correspondent wrote:—"I accidentally placed an empty flower pot over an ants' track, where it remained a fortnight. On moving it I found a complete nest full of eggs, ants, and earth, which I put in a pail of hot water and destroyed the whole, repeating the process with equal success." As you also have found the plan good we repeat the experience of our old correspondent, and new ones may easily try this simple method of eradicating ants.

Mahonia Aquifolia (W. S.).—The berries sent are those of the above-named plant, which make an excellent preserve, that some have highly praised in sore throats; but whether that be the case or not, it is as excellent and palatable a preserve as is made of any fruits in this country; and the fact only requires to be generally known, that all who cultivate this beautiful shrub—and there are few who do not—may be enabled to apply to such domestic use the abundance of beautiful purple berries which this plant annually produces. The preserve is made in the same way as that of Black Currants, Plums, or other fruits which are applied to similar purposes.

Seedling Oranges (Petio).—You do not say what convenience you have for growing the plants, but if only an ordinary greenhouse they will be better not repotted until spring. Remove the moss from the surface of the soil with a pointed stick, and do not allow it to grow again; stirring the soil occasionally will prevent it and be good for the young Orange trees. The presence of moss is indicative of stagnant soil. Give the plants water when the soil appears slightly dry, and only then, always pouring on sufficient to pass quite through the soil. If the pots are pretty well filled with roots in March the plants may be placed in others about 2 inches wider, draining them well, and using turfy loam, pressing it down firmly.

Early Hardy Flowers (Idem).—We fear there are few plants that will answer your purpose. White Aconites and Snowdrops are the earliest of bulbs, and planted in October would be over in time for sowing the beds with annuals. Iris reticulata is also early, rich, and sweet, and Triteileia uniflora is pretty in masses in early spring. Crocuses, Hyacinths, and early Tulips might be grown, and the beds be afterwards planted with Stocks, Asters, Zinnias, Phlox Drummondii, Petunias, French and African Marigolds, and Scabiouses, which are readily raised from seed, but not sown in the beds after the bulbs are over, as the seedlings must be ready for planting then.

Setting Chrysanthemum Buds (Lover of Perfection).—The term "setting" means fixing or establishing the buds. When a bud forms in the tip of a shoot at this season it is "taken" or fixed by promptly removing the growths surrounding it with the point of a penknife, and the bud then develops into a fine bloom; but if the growths or breaks are allowed to extend the bud shrivels; it has not been "taken" or fixed, and later and smaller flowers are produced by the growths that are permitted to extend, these terminating in buds. No further growth starts from these, hence they are called terminals, the earlier buds around which two or three shoots spring naturally, if allowed to do so, being termed crown buds. Numbers of persons who grow Chrysanthemums fail to observe these buds, but growers of blooms for exhibition watch for them, and "take" all that in their judgment show at the proper time for the development of grand blooms.

Name of Caterpillar (C. B., Lichfield).—The specimen sent is the caterpillar, about half-grown, of the vapourer moth (*Orgyia antiqua*), which feeds upon a variety of shrubs about gardens and along lanes, but it is not sufficiently abundant to do injury to cultivated plants of any kind. The species belongs to that group of Lepidopterous insects where the bodies of many of the caterpillars are adorned with "tussocks" or pencils of stiffish hairs, which at the time of its final change are woven by the insects into their cocoons. A notable peculiarity in this species is that the female is wingless, the eggs are laid by her upon the cocoon, where they remain from the summer or autumn until the ensuing spring.

The Medlar (J. B.).—Your tree is a Medlar, known botanically as *Mespilus germanica* and is a native of several European countries, chiefly England, France, and Germany. The fruit in its natural condition is hard and extremely astringent, but after undergoing a kind of incipient decay, which is termed "bletting," it becomes softer and of more agreeable flavour, slightly acid with some astringency still remaining. The fruits are commonly eaten in an uncooked state, but some persons prefer them as a preserve. The tree is raised from seed, but the usual mode of propagating is by grafting or budding upon the Quince, Pear, or wild Medlar, or sometimes, especially on the Continent, upon the White Thorn. The fruits should be gathered at the end of October or in November, and must be laid thinly upon dry shelves. It is fit for use in a week or two after gathering, but will keep for two months.

Hyacinths (E. Mason).—You give no idea as to how many you desire to grow. The following are "good, and not dear," and you can choose as many as you wish in the order in which they are named in each section:—*Single Red or Rose.*—Von Schiller, Gigantea, Charles Dickens, Mrs. Beecher Stowe, Macaulay, Robert Steiger, Solfaterre, Sultan's Favourite, La Joyeuse, Lina, Baron Rothschild, and Madame Hodgson. *Single White.*—Baroness Van Tuyl, Elfride, La Candeur, L'Innocence, Madame Van der Hoop, Mirandolina, Paix de l'Europe, Queen of the Netherlands, Miss Nightingale, Grand Vainqueur, La Franchise, and Alba Maxima. *Single Blue.*—Charles Dickens, Baron Van Tuyl, Grand Lilas, Marie, Couronne de Celle, Mimosa, Sir John Lawrence, L'Unique, Haydn, Jescho, La Precieuse, General Havelock, De Candolle, Baron Von Humboldt, Argus, and Lord Byron. *Single Yellow.*—Ida, Bird of Paradise, Duc de Malakoff, Anna Carolina, La Citronnière, and Alida Jacoba. *Double Red.*—Waterloo, Lord Wellington, Regina Victoria, Noble per Mérite, Princess Dagmar, and Groot Vorst. *Double White.*—La Tour d'Auvergne, Prince of Waterloo, Triumph, Blandina, Bouquet Royal, Jenny Lind, and Anna Maria. *Double Blue.*—Van Speyk, Louis Philippe, Blocksberg, Garrick, Lord Wellington, and Prince Van Saxe Weimar.

Vine Leaves Discoloured (A. H. G.).—We do not think there is much the matter with your Vines—nothing at all if the roots are working freely in fresh soil and the Vines are not overcropped. The season, in the south at least, has been an exhaustive one to Vines, the dry air and bright sun causing excessive transpiration, and unless a proportionate quantity of water has been given to the roots the foliage has lost its freshness prematurely. It is quite common for the leaves of Gros Colman to show signs of withering before the fruit is ripe, and some growers have found it advisable to slightly shade the Vines with hexagon netting in very hot weather; but if all the leaves of your Vines are as good as those before us you will scarcely find it necessary to adopt that practice, especially if the roots are well supplied with water and you continue ventilating the house judiciously. Gros Colman is a month or more longer than the Black Hamburgh is in finishing after the colouring commences, and we have seen very fine crops colour in October. You are possibly overcropping your Vines, and liquid manure might be of much assistance. You had better not remove any great quantity of the lateral growth or you will check the flow of sap. Merely removing the tips will suffice, and possibly this may not be necessary. You give no particulars as to the age of the Vines, weight of the crop, or extent and condition of growth. The temperature is right, and your method of ventilation appears to be correct. You will find the names of your plants below.

Gloxinias from Leaves (A. G.).—There are various methods followed in

multiplying by this means. Some make incisions in the main veins on the lower surface of the leaves, and lay them flat on a bed of silver sand in the propagating house. Over the cuts small pebbles are placed to prevent the leaf shifting until roots are formed, and in the course of time small crowns are formed, and each makes separate plants, which will flower the following summer if carefully ripened and preserved over the winter. Another plan is to cut up the leaves into slips, following the direction of the veins, and running the knife out without damage to the margin. This operation should be performed with a very keen-edged knife, so that the tissue of the leaves is not lacerated. By this means the leaves may be divided into a number of wedge-like pieces, narrowing to the bases. These are inserted into pots filled with silver sand intermixed with a little peat soil; and after moistening the body of the compost cover with a bellglass, or place the tops inside the glass case if the house is furnished with such. Keep moderately close, and never wet the leaves while applying water to the roots, at the same time being careful that the cuttings do not suffer from damp. Under such favourable conditions roots will soon be formed, to be succeeded by bulbs and minute leaves; but it is the best plan to pot off singly as soon as well rooted, so that the progress of the two latter is not checked, and that nice plump bulbs may be produced before the fall of the year. After the rooted portions of the leaves have been put separately into pots, have them watered and returned to the place they formerly occupied, and give them the same watchful attendance as hitherto, not once allowing the soil to get dried up, which would permanently cripple their growth, until indications of their going to rest are shown at the end of summer. No more water will be required after such symptoms, except enough to prevent the soil from getting dust dry, and thereby causing the bulbs to shrivel.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss or soft green leaves form the best packing, dry cotton wool the worst. Not more than six specimens can be named at once. (*H. M.*)—Your plant appears to be *Helianthus multiflorus*, which is closely related to *Harpalum*, and *H. rigidum* is by some writers ranked as a *Helianthus*. (*A. H. G.*)—1, *Santolina Chamaecyparissus*; 2, *Antennaria plantaginifolia*; 3, *Alstroemeria chilensis*; 4, Appears to be a *Lysimachia*, but we cannot determine the species; 5, A variety of *Potentilla atrosanguinea*. (*T. W.*)—1, *Erigeron acre*; 2, *E. canadense*; 3, *Senecio vulgaris*. (*R. P. O.*)—1, *Trachelium caeruleum*; 2, *Eryngium amethystinum*.

COVENT GARDEN MARKET.—AUGUST 19TH.

SOFT fruit is now nearly over, and prices are higher. Heavy supplies of hard fruit to hand, with a steady trade doing.

THE CLERGYMAN'S FARM.

(Continued from page 150.)

It has recently been laid down as a self-evident fact that the average clergyman must fail as a farmer. We do not by any means agree, for, as we have shown, his farm is, or ought to be, a home farm specially devoted to the production of farm produce for home consumption, and not for the cultivation of crops or the rearing and fattening of live stock for market; and we fail to see why a clergyman may not do this as successfully as anyone. Certainly he ought not to fail in

making his farm contribute materially to the wants of his household, and it should also enable him to avoid most of the buying and selling for which our contemporary considers him so unfit. The especial object of these papers is to assist him in doing so, and we now turn to our subject for this week, which is the culture of the most useful of the green crops. It is not an easy matter to say when such crops are most useful. Take, for example, the present time, with pastures parched by drought, do we not find a bountiful supply of spring Tares invaluable? In many an instance what a lamentable falling off in the supply of milk would there have been, were it not for the daily cartage of succulent Tares to the meadows and cow-sheds. Therefore, we should always strive to spare enough land for successional sowings of Tares from early spring onwards into June, and they are used for cows, for horses, pigs, and sheep; or, if not all wanted, the surplus is ploughed in for manure, imparting much more fertility to the land than it has taken from it.

Red Clover is another green crop which, under favourable conditions, affords at least three growths, the first two being made into hay, and the last being fed off by sheep. Just now we are turning the second growth to profitable account by folding old sheep upon it, and we may mention here that this system of folding enables us to keep many more sheep than could otherwise be managed. We have had some trouble in having due attention paid to our wishes as to the size of folds. A hurdle to a sheep is our rule; but, to save trouble, shepherds will use many more hurdles if they can, and then much of the Clover is spoilt, not eaten. Small folds insure close cropping of the herbage and an equal distribution of manure. A mixture of Red and White Clover with Perennial Rye Grass affords early green food in spring, and a heavy crop of hay later on. It is, however, only upon an emergency that we turn cattle or sheep upon this crop in spring, our usual plan being to reserve the first growth for hay, and the second growth too if the land is rich and green food plentiful. Our chief aim is to do all we can to insure good crops, and, when we have done this, to turn them to the best account, our actions being guided by circumstances rather than by strict rules—green food being much more in demand some seasons than others. Another very useful mixture, more durable in character with the two sorts of Clover, consists of such strong-growing Grasses as Cocksfoot, Timothy, Fescue, Foxtail, and Crested Dogtail. This yields a heavy crop, makes good hay, and is to be regarded as a permanent pasture, to which if we add a fair proportion of Yarrow, Trefoil, and Alsike, with a few of the finer Grasses, we shall impart the best possible combination of meadow plants for both cattle and sheep.

Rape and White Mustard are often sown at this season of the year to afford a late supply of green food for sheep. Of the two, Mustard is preferable for its quick strong growth and its high value as a manure when ploughed in. We may usefully repeat here that instead of bare fallow and the so-called resting of land, we now get the land clean, sow it with Mustard, using 20 lbs. of seed per acre in spring or early summer, plough it in as soon as it is in full bloom, sowing and ploughing again and again, two, three, or four times should the summer prove favourable—drought being the chief hindrance, and in autumn sowing either Wheat or winter Oats. We must make mention of winter Oats among green crops, for in a backward spring winter Oats afford a supply of green food of especial value for sheep. If so eaten off, the crop may be slightly retarded, but it is seldom that winter Oats are not ready by the middle of July. As a corn crop they stand in the first rank, the yield, both in straw and grain, being excellent in quality and quantity under good cultivation.

Rye is another green crop that is sown in September, or, at latest, early in October, for an exceptionally early cut of green fodder for horses and dairy cows, as well as for folding with the breeding flock. We have no green crop so early as this, and none more useful. Trifolium incarnatum is, perhaps, one of our most profitable green crops, of such easy culture that no ploughing is required for it. We first well

harrow the corn stubbles to clear off rubbish, then sow the seed, pass the harrows over to cover it, and the work is done. It may be termed a second early green crop, affording a very heavy bulk per acre, which is generally used green for horses, sheep, and cattle. Trifolium hay was at one time disliked, but under the modern system of chaffing and mixing it proves as valuable as any other fodder. Lucerne, Sainfoin, and Trefoil are also excellent green crops that well repay careful culture, without which no farm crop really answers, for, simple as is the culture of Trifolium, the soil must be fertile to insure a full crop.

(To be continued.)

WORK ON THE HOME FARM.

Seldom if ever have we seen the ewes brought into the market in such poor condition as at the present time. This is doubtless an outcome of hard times, the lambs having been kept with the ewes much later than usual; food has been scarce, much of the pasture being parched by drought, and other food was not to be had for the flock. The result is lamentable in the extreme, for in such instances the ewes have become so greatly reduced in condition that they are driven to market in wretched plight, and are got rid of at prices in some instances as low as 16s. Such cases are of course extreme ones, and they are probably only practised by those farmers having old ewes not worth keeping for another lambing season. Lambs and sheep under careful management are in excellent condition. All the sheep have been dipped in Cooper's mixture. We have five flocks, and may mention as a pleasing fact that we have not had one bad case of fly striking. That pigs answer and are profitable if well managed is quite true, but that they are so greedy that without due care there may be a considerable loss with them in a very short time. We have now about 200 nice young porkers ready for the stubbles, where they are taken daily by boys as the corn is cleared from the fields.

By the time they are again settled in the yards they will have materially improved in condition, and then they will have home-grown corn regularly, and be drafted for sale as they become big enough. With such young pigs it answers to use unthreshed Peas, giving them enough of the haulm daily to keep them plump. This answers well, and in connection with this use of unthreshed corn for home consumption we may mention the chaffing of Oat sheaves for horses, cattle, and sheep. The corn is chaffed with the straw, and it makes a wholesome and nutritious mixture. This is a lesson in economy which we gained from a shrewd Scotch farmer, and we commend it to the notice of our readers as one of the important little things which tend to successful results. Repeatedly do we have evidence of the soundness of the advice often given to keep really well-bred cows and store cattle. On the day we write this note we have seen polled heifers sold at really profitable prices simply because they had ripened for the butcher so early without any loss of calf flesh. Inferior animals, on the contrary, are now so low in price as to entail a loss upon those rash farmers who will persist in keeping them despite the stern lessons of adversity which cannot be ignored with impunity.

OUR LETTER BOX.

Clover Pest (W. Catleugh).—The "stuff" which comes in patches among the Clover is the common Dodder (*Cuscuta trifolii*). It is a parasitical plant, its seed germinates in the soil, and the slender stems run over the Clover, affix themselves to every branch or leaf with which they come in contact, feed upon and eventually smother the plants. To eradicate it not only pare the soil containing the dead patches of Clover, but a margin a foot wide around them, and burn the whole on the spot, for if you attempt carrying the dead plants and pared soil to one large fire, seed of the Dodder may be scattered about to bring more of the pest next season.

REMARKS.

9th.—Dull early, with slight drizzle at 9 A.M., then fair.
10th.—Overcast early, bright and breezy later, then fair.
11th.—Pleasant day though windy, and frequently cloudy; shower in evening.
12th.—Cloudy early, bright till about 4 P.M., then heavy rain; fine night.
13th.—Fine and bright.
14th.—Cool, but fine.
15th.—Very hazy morning; fine bright afternoon.
A dry week; temperature very nearly the same as last week, and very near the average.—G. J. SYMONS.

WINTER GREENS.

IN consequence of the protracted drought that has prevailed over the greater part of the kingdom a scarcity of green vegetables in winter and spring will in all probability be experienced in many gardens. Cultivators who did not take prompt advantage of the intermittent showers that fell early in the season in putting out plants are in a much less favourable position than others who felt it safer to plant even if their Cabbages, Borecoles, Brussels Sprouts, and Broccolis were small instead of waiting for them to get larger. The loss of a chance for planting has proved a serious loss, and plants have spoiled in the seed beds while their owners have been waiting hopelessly for rain.

Possibly by the time these lines are printed the long-looked-for rain will have fallen in sufficient quantity to moisten the parched ground. There is unfortunately no certainty about this, but already welcome showers have fallen in some places, and barometers have been steadily falling in most, also the temperature. These are indications of a change, and a general downpour would be welcomed in thousands of gardens. The Americans also have warned us that a "depression" is crossing and will cause "local disturbance" on our coast. Very "local" indeed have been the effects of previous depressions of which we have been advised, and a good "general disturbance" is overdue.

Let no one imagine that their plants are too small or too much drawn for planting when the ground becomes fit for their reception—that is, those individuals who failed to plant early in the season. Mr. Iggulden some little time ago advised the insertion of even tall plants that have been languishing in seed beds, placing them slantingly in rifts formed with a spade. That was good advice to those who failed to plant earlier, and the advice holds good even yet. It is astonishing how miserable hard-stemmed leafless plants improve under the influence of autumn rains after a season like the present, when the earth has been made unusually warm by weeks of hot sun. The plants cannot attain a large size, but if three, four, or more are inserted in the space that is usually occupied by one a great quantity of acceptable produce may be had from the land, and especially if a long mild autumn is in store, which is not at all unlikely. At any rate those who foresee a scarcity of winter greens will act wisely in expecting a long autumn, and inserting accordingly such plants as they have or can obtain. Cabbages, Savoys, Broccoli in variety will all afford useful produce, especially Cabbages or Coleworts.

Fortunate are those individuals who have sufficient of these for planting large breadths of ground. In every garden where a supply of green vegetables must be maintained, seed of Coleworts, with any varieties of small Cabbages, should be sown freely about the middle of May. It costs little, and some hundreds or thousands of plants can be raised on a comparatively small plot of ground. It is best either to sow thinly or thin quickly to prevent violent crowding, and let

the plants remain in the seed beds till ground vacated by early Potatoes or other crops is ready for them, or the weather is favourable for planting. Put out now the plants need not be more than a foot apart, but if planted some weeks earlier a little more space may be accorded them with advantage.

From October right through the winter, and far into spring, the plants will yield produce of the first quality, and far superior to any of the Kales or Savoys, and quite as tender and delicate in flavour as Brussels Sprouts. These must be grown, but even in their absence there will not be very serious complaints of the quality of winter greens if there is an abundant supply of Coleworts and young Cabbages, with hearts not much larger than good-sized Lemons. These also endure more frost than many persons imagine, and as to the Hardy Green Colewort, it is seldom killed during very severe winters. It is as hardy as any other winter green, and its dwarfness gives it an advantage over most, inasmuch as it is often snugly protected with snow when its taller congeners are exposed to the rigours of a protracted frost. More than once all has been lost but the Coleworts, and in that case the supply of winter greens invariably gave complete satisfaction.

Market gardeners are more fully alive to the importance of this crop than private growers, as a rule, though some of them need no enlightenment on the subject. Thousands of these plants will be inserted in fields immediately the land is moist enough, and large breadths are now growing in gardens where their value is known and occasional showers enabled their being planted some weeks ago. They should still be inserted wherever they are provided or can be obtained, and they will do much to mitigate what appears to be almost a certainty of the future—a very inconvenient scarcity of green vegetables in winter and early spring.

Old Cabbage stumps are commonly cleared off the ground in large quantities at this period of the year, but persons should think twice before destroying them this season. In many, and probably the great majority of cases, it will be far more profitable to leave them, cutting off all the heads or hearts that are in any way firm—that is, if they can be spared, and clearing off all dead and decayed leaves. The appearance of the quarter will not be particularly inviting for a time; but the neatness will be an improvement on the mass of withering insect-infested leaves removed, and by-and-by, after the rains fall, the stumps will bristle with clean fresh growths, and eventually the old Cabbage plot will be the most admired in the garden. The forest of spring-like growths will be refreshing, and the owner or gardener will have the enjoyable privilege known as "cut and come again" for weeks or months, while the produce can scarcely be grumbled at by the most cantankerous of cooks. Do not, then, destroy old Cabbages during a summer like the present, but give them a chance of becoming young again, and proving their value and your forethought when the pinch comes—with other people.

Failing a supply of the plants above referred to—and it is certain they are very scarce in many places—the usefulness of Turnip tops should not be overlooked. Tons of these are sold in the markets in winter, or rather the early days of spring, and most acceptable they are. The slightly bitter taste of the growths of the common white Turnip may not find favour with all, but to many palates it is particularly agreeable, and ten times more of this variety are grown and sold for the purpose in question than of the Swedish Turnip, the growths of which are not bitter at all. Both may usefully occupy plots that in ordinary seasons would be filled with other vegetables, and a choice will then be afforded. For years past, when the ordinary kinds of garden vegetables have been plentiful I have had to send into the fields for Turnip tops as a change from Brussels Sprouts, Cabbages, and Kale. But it is not in all districts where this can be done; yet what cannot be gathered in fields may be produced

in gardens with the greatest ease, for all that is requisite is to scatter seeds on vacant ground and work them into the surface with a rake. In some gardens this is done as part of the ordinary routine of cropping, but by no means in all, and the advisability of extending the practice is worthy of consideration at the present time. There is at least this in its favour, that if the produce is not used it will be worth far more than the cost of the seed for digging into the ground as manure, especially in light lands. Seed may be sown at any time from now till the middle of September.

Spinach should be grown more freely than is customary in gardens where the vegetable supply is likely to be limited. This is a most wholesome vegetable, and when properly cooked and served, dishes of it are apt to be sent empty away. It is quite immaterial whether the round-seeded or summer Spinach, or the prickly-seeded or winter Spinach be sown now, and persons who have surplus seed of the former may use it with the variety purposely obtained for sowing at this period of the year. If there be any difference between the two it is not unlikely the so-called tender variety will prove the hardier, and it will be at the least equally productive. I grew no "winter" or prickly Spinach for ten years, yet never failed to have an abundant winter supply with the summer or round variety. I presume the reason why the one is considered hardy and the other tender is because some fanciful or enterprising individual printed a statement to that effect at some remote period, and the compilers of catalogues have copied each other with characteristic fidelity ever since.

Is it generally known that the round-leaved Batavian Endive is excellent when cooked? Some persons enjoy it in that way better than any other, and it has on more than one occasion proved serviceable as a culinary vegetable in midwinter. Those who have plenty of plants or can raise them quickly might do worse than grow a few extra for the purpose indicated. Judging by the bare appearance of many gardens it is obvious that "something must be done," or there will be unpleasant reminders of the scarcity of green vegetables before spring Cabbages are ready for cutting; and we must remember that these will be late in many gardens, the dry weather having arrested the germination of the seed and checked the growth of the plants.

This is a plain article on a plain subject, yet not unimportant, for after all that can be said in praise of the skilful cultivation of flowers, it remains that the most important of all the duties of a gardener is to "keep the pot a-boiling."—*EXPERIENTIA DOCET.*

FRESH SOILS AND COMPOSTS.

THERE are two reasons why no better period during the whole year can be chosen for collecting and preparing soils for the ensuing winter operations in the fruit garden than the early part of September, provided the weather is dry. In the first place, soils should never be handled when in a close or stagnant state; and in the second, there can be no doubt that loams and other adhesive soils are then much fuller of the gaseous matter of the atmosphere than at any other period. Soils handled in a damp state become what country folks term "livered," or, as some have it, "sour,"—their particles become forced closer together, whereby the qualifying and wholesome air contained in their interstices is forced out, and the air cavities of course compressed. This occurs through the tread of the foot of either man or horse, and is also continually taking place through the action of the spade or other implement employed in digging and collecting it.

Soils thus circumstanced are with difficulty pulverised again: indeed, if buried orthwith below the ground level they will long retain these awkward properties, and if preserved in the compost yard, many months pass away, and some handling is requisite in order to get them in a wholesome condition again. They are fuller of the invigorating and mellowing agencies of the atmosphere in the end of summer, for it is well known how pent-up and stagnant moisture becomes evaporated by the heat of summer, the place of which must of necessity be filled with air.

Strong soils, moreover, contract much by drying, and this, as is well known, causes them to rift in all directions, which

mechanical action is of the utmost benefit to the soil, as ultimately promoting easy pulverising. We need scarcely add that the latter process is absolutely essential to fertility.

Now, a winter's fallow or exposure to the alternations of frost and thaw will produce the same mechanical effects; but then the soil becomes filled again with moisture. Thus it will be readily seen why the end of the summer is decidedly the most eligible time to collect soils. Another point recommends this course: the turfy material at this period contains a greater amount of organic matter than at any other period. Gross herbage will be found to prevail, and a vast accumulation of organic remains of the previous spring's growth, and we need scarcely say that all good cultivators esteem their soils in proportion to the amount of organic matter they contain.

We would have all young gardeners pay the utmost attention to these points. Much, very much, is to be learned from the study of this apparently simple affair. Of course the remarks here made apply principally to what are termed loams—that indefinite class of soils fully understood by the practical man, the squeeze of whose thumb and finger will determine with tolerable accuracy the character of such soils.

Now, it must not be supposed that in speaking of composts, soils, &c., that we would wish our readers to infer that we are continually harping about loam. It must be confessed that loam—good loam—is the very elixir of the compost yard; still, as we are not advising the year round about Strawberry potting, Melon culture, and the like, we must cast our eyes over the wants of the cottager and the amateur, and see what advice can be given them in the improvement of the staple in their respective plots, more especially as concerns fruit tree culture.

Various, then, are the materials that may be collected for such purposes, varying, too, with districts. Besides, the question is not always what ought to be had, but what can be had; and it so happens that many self-taught amateurs, possessed of much horticultural acumen, will turn materials to account which some gardeners would utterly despise. Amateurs, cottagers, &c., as well as folks already possessed of good gardens, frequently have to enclose and reclaim plots of ground where nothing of a loamy character exists. Sometimes the new plot is gravelly, sometimes very sandy, and oft-times of a peaty, boggy, or moor soil character. It not unfrequently happens, also, that the plot is in a town or in the suburbs, where, it may be, brick rubbish and the most ordinary soil lie side by side in pell-mell confusion.

In anticipating improvements in such soils or sites, the first thing, of course, is valorously to determine on thorough drainage if necessary. This we will take for granted. Next, to consider the general character of the plot, and if great inequalities exist in point of texture, to determine on making the clay help the sand and gravel, or *vice versa*, as the case may be. These things concluded and plans of culture laid down, it will be readily ascertained how much and what character of improveable material is requisite to carry out the plan. Such, then, forms a legitimate course of procedure for the end of summer, provided the chance offers; and an active and thinking person will set about getting together materials according to the demand.

We need hardly remind townsfolk or suburbaners of the facility that exists in general for getting together such imperishable materials as brick rubbish, old plaster, charred material, &c., by which to open the staple of soils hitherto retentive of moisture. On the other hand, the refuse of the carpenter's bench or workshop may be sought for such things as shavings, sawdust, &c., all of which are available as vegetable or organic matter to add to the embryo dung-heap.

The turfy material from ordinary commons or wastes is not to be despised because it is easily procurable. It is astonishing what an amount of nutritive qualities is contained in the surface skimmings of such places, albeit the staple of the soil beneath is below consideration. Here will be found an accumulation of vegetable matter, the work, it may be, of ages; and here by consequence, a vast amount of nutritive qualities which all organic matter in its progressive decay furnishes in a steady way to the generation of vegetables or trees by which it is superseded.

We have now been speaking of organic matter chiefly; for, indeed, many sterile plots need much in this way. We have many a time seen fresh garden enclosures or reclaimed waste lands, in which a thorough drainage and a liberal addition of such matters, would at once set the plot agoing.

Speaking of the obtaining of materials for improvements, we may here advert to the one of charred matter, and in so doing must beg to recommend those who wish to avail themselves of such a useful and profitable article to direct their attention at once to its accumulation. No better time can be taken for the purpose. Nature, ever bountiful in her vegetable pro-

ductions, has by the month of September covered every common and wild, every lane and roadside, and even the most barren moor with coarse herbage adapted to work up in this way. Moreover, the garden itself, with its appurtenances of hedge clippings and other coarse material, yields at this period an unusual amount capable of being made into a most useful component of a renewing compost.

Let us, then, advise strongly that this principle be attended to, and at this season; and that all weeds and rubbish be collected to one common spot, both to promote order and neatness and to augment the compost heap against the days of alterations and improvement.

We must again revert to the subject of loamy materials. Loams are used in general to give stability and consistence to shingly and incoherent soils. Now, since what the gardener terms loam, or "sound loam," contains a considerable percentage of clayey matter, it is evident that clay itself, or, what is better when procurable, marl, may be advantageously employed.

In the improvement of the staple, then, of loose or sandy soils, there is no doubt that even clay will be beneficial, provided it is laid on the land betimes in the autumn, and not blended with the soil until it has fallen to pieces, which will be the case by the month of March if it is turned and worked occasionally. In making stations for fruit trees on such soils, we should unhesitatingly throw masses of clay in a raw state on the proposed platform, taking care to introduce weedy or vegetable matter liberally amongst it, for the two will act well together for years as a preventive against extreme droughts, which so frequently cause fruits of various kinds to crack, as also the trees to be devoured with the red spider and other insects. Let it be remembered, nevertheless, that we are speaking of dry and light soils only; to pursue such a course on cool soils would be a most unwise procedure.

Marl, however, whether of the clay or slate kinds, is, of course, far superior to clay, but not everyone is fortunate enough to be situated in a marly neighbourhood. This may be blended liberally with all light or sandy materials for fruit tree stations, taking care that it is divided first, and adding vegetable matter freely.

Before concluding these remarks, we may be permitted to turn our attention to the amateur's Melons, Pines, Strawberries, and other fruits for forcing purposes. A good loam is almost indispensable for high culture in these fruits. Everyone should endeavour annually to procure a little fresh, for sometimes it becomes expedient to use it fresh, or to mix with other soil, as the case may be. What are termed furrowing clods are excellent for mixing with vegetable matter; and a stipulation may sometimes be entered into with the farmer, who would exchange such for manure; or they may sometimes be had for the labour necessary to procure them.—N. E. R.

TOMATOES.

THE consumption of Tomatoes is rapidly increasing, thus showing that the public is gradually rightly estimating them at their true value, either as a vegetable or as dessert, and this induces me to give a few notes regarding them.

Their culture is now generally understood, so that I shall only give a few observations on my own practice. The seed is sown thinly the first week in March when the late Vines are being started, then as soon as the seedlings can be handled we pot them in small 60's, and subsequently into 48's. Take care to let them have plenty of light and air, and strong plants will be easily obtained. I like plants from 9 to 12 inches high as thick as a finger, which require no stick or tying. Do not let young plants lose colour before putting them in their permanent quarters; loss of colour in foliage either means they are root-bound or not in a healthy condition, of course in hardening for outdoors this can scarcely be avoided. All my Tomatoes are fruiting in No. 4 or 6 pots, and as they mostly stand on hard ash paths the roots inside depend on what I give them, as supposing the roots find their way through into the ashes very little nutriment is to be found there. The simpler the compost until they set their first fruits the better, then feed them by top-dressing. In planting I only half fill the pots, gradually filling as they want it. Have the soil moderately firm, this acting two ways—first, insuring a much finer plant, and, secondly, taking less water. I take single stems up wires 9 feet long, not having only this limited length I stop the plants about 3 feet high, then again at 6 and at 9 feet. After first stopping, in addition to the leading shoot when it breaks, I let one or two laterals grow until they show their blooms, when they are stopped; by so doing an

increased quantity of fruit is obtained. I take out all weak side shoots.

This year the first blooms set very thinly, especially new varieties, but I always find the second year is better for new varieties; this is only, I suppose, because we know better how to treat them. For strong growing varieties cutting half the leaves helps the fruit considerably, but this operation requires care not to cut a large quantity away at one time, but a little daily. With many varieties it is as well to take the centre flower away, by so doing much finer fruits are obtained; generally the centre large flower comes to something very large but misshapen, and this certainly weakens the remaining bunch. However successful the pot system is, I cannot get the fruits so large as when I could plant them out, but I get more even fruits. I object to planting out if there is a chance of Tomato roots running into Vine borders, as they must rob and injure the Vines.

My own experience, together with that of several friends who grow for market, is, that however good and desirable the new varieties may be, there is nothing like a good selection of the Old Red for profit. I say this without detracting in the least from the merits of the new, several of which are handsome varieties.

SUTTON'S CHISWICK RED.—This is the best of all I grow in pots, having now bunches of twelve fruits hanging; it is a free setter and consequently prolific. The fruit is of fair size, of a good bright red, and in shape is certainly unique, being divided down the centre as though two fruits had been joined together. They come very true, not one or two good and the others indifferent. The only fault I have to mark is its light weight, and for its size it is very light. This is caused by its not being solid, but having a space between, or rather a cavity between the fruit-stalk and outer skin.

SUTTON'S READING PERFECTION.—A good Tomato for flavour, shape, and size; growth very robust. In pot culture this requires stopping directly the first blooms show. In a green state the fruit is a counterpart of Dedham Favourite for size and shape, but does not crack. This is a very solid fruit, a very great contrast to Chiswick Red. With me the crop is not very large, but I believe this is due to my not knowing its habit. I shall expect better results another time.

SUTTON'S CONQUEROR.—The seed from which I raised my plants were seven years old, showing that if seed is well managed it will keep a long time. I never wash the seeds, but simply put them on a damp flannel to clean them. This, a favourite variety of mine, is an enormous cropper, always sure, and very regular in shape; the only objection I have to it is the flatness of the fruit. Anyone can grow this either in or outdoors.

DEDHAM FAVOURITE.—Another favourite of mine, at one time objected to on the score of cracking just when the fruit was at its best, but I have overcome this by arranging the plants where they can get plenty of air and light. Judicious watering and ventilation are all that are required to grow it; neglect either, and the result is seen quickly. It is a good cropper, heavy, and of delicious flavour.

GREEN GAGE.—This should be named Yellow Gage; it is very pretty, of a brisk acid flavour for dessert, but very shy with me. Last year our Rec or had it much better growing against a wall outside. Under my care it is very robust indeed in wood and foliage, but does not fruit accordingly. I am keeping one plant poor and short of water to see the result.

VICK'S CRITERION.—A most abundant cropper, bearing egg or plum-shaped fruits of the same colour and quality as the preceding. Sometimes I find the clusters are apt to set three or four large fruits, the remainder being seedless or small. This, I believe, is for want of fertilising; a sharp shake when the flowers are dry and fully expanded will help them. I consider this good for growing in pots.

THE OLD RED.—I shall dismiss this in a very few words, as it is so well known and its culture is so simple that it must commend itself to all. Tomato growers who wish to be sure of what they are doing should save seed of this variety. I have ceased growing the Trophy, but as a friend is now doing well with it I shall try it again.

In enumerating the above varieties I do not say these are the only good ones, but they are the best I grow.—STEPHEN CASTLE, *West Lynn.*

CHOICE ALPINE PLANTS.

SAXIFRAGA HIRCULUS.—If we glance momentarily at the great genus Saxifrage we shall soon be alive to the fact that the majority of the species and varieties of which it is composed have, for the most part, white flowers. This is more especially the case with the mossy (hypnoides) section, and the crusta

ceous (or Aizoon) section. When the departure to this rule begins, the Megasea group is particularly noticeable with its bold spikes of pendent rosy-coloured blossoms. It is, however, remarkable to find so widely different a plant, both in foliage and flower, as the one mentioned above, not white or rose, but a bright and pleasing yellow, and more resembling *Anemone ranunculoides* in its flowers than those of the family to which it belongs. Its general aspect is widely different from any other Saxifrage. It is of free and easy growth, dwarf in habit, and delights in abundance of moisture, and being supplied with that does not object to full sun. The flowers, which are three-quarters of an inch across, rise from compact tufts of obovate leaves. It is best suited for marshy ground or for damp spots in the rock garden. It is a desirable plant in the artificial bog, and may also be grown to perfection in pots, which should be placed in pans of water. It is a native plant, being found in various parts among the moors.

SAXIFRAGA CYMBALARIA (Golden Saxifrage).—Speaking of yellow-flowered species reminds one of the pleasing little plant so profuse in its flowering, and needing no watching or particular care. It is without doubt one of the best plants for naturalising

Fig. 31.—*Iberis Tenoreana*.

being a free seeder, and coming up almost anywhere where the smallest portion of soil may be for it to root into. Even in hard gravel walks I have had it springing up abundantly year by year, the result of self-sown seed. It is of annual, or at the most, biennial duration, forming early in the year compact little tufts of glossy light green Ivy-like leaves and numerous bright yellow flowers. These are produced as the plant grows till quite late in autumn, and from the commencement it is always in flower. As it grows freely in a variety of situations it is well suited for naturalising, and by collecting and distributing its seeds very pleasing results may be obtained by the ensuing spring.

SAXIFRAGA GRANULATA FLORE PLENA.—I refer to this plant now to caution those unacquainted with its general habit from regarding it as dead and casting it away. I have known this to be repeatedly the case when it has gone to rest and its sole energies for the coming year are concentrated in those little granules beneath the surface. I may remark that it is well suited to damp situations in partial shade, and that it is also useful in a cut state. I have had some sprays of it quite ten days in water—a good test of its durability and consequent usefulness.

IBERIS GIBALTARICA.—This is the finest of all the Candytufts, but seedlings differ considerably. Under glass the flowers

are usually white, though not so good or clear a white as are some of the more hardy kinds. In the open ground its fine heads of flowers are generally of a reddish-lilac hue. It is larger in all its parts than any other species, of trailing habit, having oblong spatulate leaves. The individual flowers are long, and deeply and distinctly toothed. It is easily increased by seeds, and also by cuttings, the former making the best display. Seeds can be sown from midsummer to the end of August, and the plants grown on in pots make useful ornaments for the conservatory or for cutting.

I. TENOREANA.—A very handsome *Iberis* is that shown in fig. 31, and it is especially well suited for culture in pots, though it is also a fine rock plant. The flowers are large and round in compact massive heads.

IBERIS CORREÆFOLIA (Correa-leaved Candytuft).—I believe that respecting the origin of this plant there is some doubt, and that it is often confounded with the (Coris-leaved Candytuft) *I. corifolia*, from which it is very distinct, the latter only attaining when in flower a height of 3 or 4 inches, while the species to which I refer generally grows about 9 inches to 1 foot high. Mere height, however, is not a sufficient specific distinction, but there is a wide difference in the leaves of a *Coris* and those of a *Correa*, and considering that the two appear to have received their names from the similarity of their leaves to those of the two genera named, there should be no difficulty or confusion respecting them. The one to which I am now drawing attention is that commonly known as the white Perennial Candytuft, which produces globular umbels of pure white flowers. It is in full beauty from the middle to the end of May, depending on the season, and lasts a long time in perfection. It is hardy in the extreme, and is adapted for the rockery, the border, or for lines or masses. It may now be propagated by means of cuttings, selecting half-ripe shoots, and strip them off with a heel, inserting them under handlights in shady positions in sandy loam. The best cuttings will be those around the base of the plants, and when of 2 or 3 inches in length.

[We give an illustration, fig. 32, of the true *I. corifolia*, which is quite distinct from the hybrid *I. correæfolia*. The latter is also known by the preferable name of *I. coriacea*. We may add that *I. coriacea* or *correæfolia* was raised by Mr. H. Turner, formerly curator of the Botanic Gardens, Bury St. Edmunds, and is said to be the result of a cross between *I. sempervirens* and *I. saxatilis*. Mr. Turner relinquished his appointment in 1857, so that the plant must have been raised some time previous to that year.]

IBERIS SEMPERVIRENS PLENA.—The typical plant, or Evergreen Candytuft, is one which has many claims upon our notice; in fact few spring-flowering plants are better known than this, and few more universally grown. Its half-shrubby, dwarf, evergreen tufts are transformed in April to masses of snowy white, and which alone has given it a place in many gardens from which many plants have been excluded. It is indispensable in all spring gardens, is readily increased by cuttings or seeds, succeeds well in almost all soils, and is adapted to a variety of circumstances. We can deservedly say all this in regard to the original species; but how much more may worthily be said of the double form to which I wish to allude. Only those who have seen the two side by side can form an adequate idea of the superiority of the latter. It resembles in habit and general appearance the typical species, but differs in its snowy white heads of flower. In the former the yellow anthers are conspicuous, while in the latter they do not exist. Besides being valuable for the garden generally, it is, I think, destined to become a popular plant for cutting from, and being somewhat earlier in flower, will make it the more valuable, while for spring gardening it is sure to meet with many admirers.

SAXIFRAGA FORTUNEI.—A distinct species, being deciduous, and an autumn bloomer. As a pot plant for late autumn it is desirable, though it is by no means a common plant in gardens. It usually attains a height of 12 or 15 inches, seldom more. The leaves are large, fleshy, and somewhat reniform, the flowers are white, borne on pyramidal spikes. It is easily increased by division.

OMPHALODES LUCILÆ.—When referring to alpine plants some time since, your correspondent, "D, Deal," spoke of this as "disappointing." I believe that was the term employed. To my mind this is one of the most delightful of alpine plants. When seen in good condition its lovely sky-blue flowers are unique. It certainly has not the intense and lovely gentian blue of *Omphalodes verna*, but seeing that we have so plentiful a supply of this colour in the Gentians themselves, we can hardly wish a change to take place. It may be that your correspondent has not altogether succeeded with this plant, and if so, and his plant is a small one it may be, as your correspondent remarks

somewhat disappointing. Its dwarf caespitose tufts of leaves of glaucous hue, and the sky-blue flowers in profusion, seem to me the very type of sweet and modest grace and beauty. I have grown this charming little plant for years, and know something of its requirements. I remember well the great nuisance that slugs were to the first plants I ever had, and how I watched with anxious eyes lest it should suddenly be devoured, for slugs are particularly fond of it. After a year or two, when I became more familiar with it, I managed to root it in quantity from cuttings, which I believe was hitherto unknown, and from that time I could generally keep pace with the demand either by seedlings or cuttings. The seedlings in some cases were devoid of that pleasing glaucous hue which characterises the true plant, the flowers, however, being identical. I never saw it in finer condition than on the rockery of the late Mr. James Atkins of Painswick, where it grew with remarkable freedom. I have always found it to succeed best in about equal parts of peat and loam made rather sandy, and with plenty of depth for the roots. The way I used to obtain cuttings is as follows. Place a hand-light over the plant and keep comparatively close, giving air daily, still keeping it sufficiently close so as to excite new growth somewhat quickly. When 3 or 4 inches long, detach them with a heel from the main body and insert at once under a bellglass in very sandy soil, keeping quite close and well shaded. The seeds, which vary considerably in their germinating powers, sometimes lay dormant for eighteen months in the soil, others

Fig. 32.—*Iberis corifolia*.

will appear in a few months. These require very careful handling and watching, for it is in the very small state that they are most likely to be lost.

ERITRICHIMUM NANUM.—Another plant to which the same correspondent alludes as having defeated all his attempts to cultivate successfully, and I fear many more could tell the same tale. It is one of the loveliest of all alpine gems, its miniature blossoms and the intensity of its lovely blue flowers bearing favourable comparison to the intense blue of the Vernal Gentian. It is certainly a fastidious alpine, and one requiring much skill and considerably more patience to know what its actual requirements are. One thing, however, I consider as certain, and which is, that it will never be a long liver if placed or planted on the level, whether that level be the border, the rockery, or in pots. I have experienced it to damp off suddenly and unawares in these positions. What it seems to need most of all, and what is most difficult to supply, is abundant moisture in spring and early summer, in imitation of melting snows, and a dry bed in winter, during which season it is deeply embedded in dry snow. These conditions we cannot imitate in England, and consequently upon our variable winters, our incessant day by day changes, we are wont to lose a very precious gem among alpine plants. It would seem also to require that its tiny roots

should always be in the cool, and to meet this I have never found it to succeed so well as when placed between two flat stones, after the manner in which the Parsley Fern (*Allosorus crispus*) and the Scaly Fern (*Ceterach officinarum*) inhabit the stone wall and cliffs in many parts of England. Choose a crevice where it can be accommodated in this way, and for the winter season a piece of glass may temporarily be placed overhanging it to shoot the water from its downy tufts, for it is the excessive damp gaining a lodgment in its intense downy tufts that destroys the majority of the plants which reach this country alive. I have attempted growing it in frames, keeping air on during all weathers, and I must say the severer the winter the better it has pulled through; not so, however, in mild winters, when the atmosphere is so overlaid with moisture. This little gem is widely distributed throughout the whole range of the Alps, and is often found at great elevations. Though I have to some extent been successful in its culture, my success is by no means complete, and others who have done well with it would render service by stating the exact circumstances under which it is placed.—J. H. E.

LIFTING VINE ROOTS.

SOME gardeners—not all, of course—have a religious horror of touching the roots of their Vines once they are developed in the border prepared for them. They may be wandering deep down in some cold subsoil, the Vines may be showing unmistakeable signs of something wrong, and yet they hesitate to disturb the roots lest they kill the Vines altogether. But a Vine is wonderfully long-suffering, and will permit its roots to be entirely lifted, of course with care and skill, as though it knew that the present tribulation were but the forerunner of something good to follow. When Vines are suspected of having their roots in the subsoil, away from control, and from the proper nourishment they need to enable them to flourish, no time should be lost in lifting their roots.

Early spring or autumn should be chosen for the operation. The surface soil should be removed, and if good laid aside to mix in with the new compost afterwards to be applied to the roots. When the roots are approached a five-pronged fork should be used, and the soil gently and carefully removed from about them, care being taken that the soil is lifted in such a way that the roots run through the fork and are not broken by being caught sideways.

All the old soil having been removed, and as many roots as possible having been rescued from the subsoil, all the roots should be carefully laid back and some of the new compost filled in, the first layer of roots being spread out when the soil approaches to within 6 inches of the proposed top of the border. Sprinkle some fine soil freely mixed with Thompson's or other approved Vine manure over the roots, then fill in more good compost till within 3 inches of the top, then the remainder of the roots may be laid out, more fine soil put on, then a slight coating of good cowdung, and lastly a surfacing of a couple of inches of soil, leaving the border several inches higher than ultimately it is wished to be, as the whole will sink more or less. A supply of tepid water before the dung is put on will be of much service where the compost is on the side of being dry.

Vines treated in the manner described may be relied on, other things being favourable, to amply repay for the trouble and expense bestowed on them. When once Vine roots are near the surface they may easily be retained there by judicious feeding on the top. A little fresh soil and Vine manure added every year will keep them on the top, and will amply reward the bestower.

No mere tinkering will do when Vine roots are in the subsoil. "Up, men, and at them" must be the word of command, and there need be little fear that the result will be anything but entirely satisfactory. When Vines look sickly or show signs of failing health in nine cases out of ten such a course as described will work wonders—that is, of course, when the Vines are not eaten up with bug, as sometimes is the case, when the best plan is a total clearing out, a thorough cleansing, and planting other Vines.—S.

VIOLAS.

THE long spell of hot dry weather which has been severely felt even in the midland districts has fairly tested the staying qualities of Violas and bedding Pansies, for experience has shown me that some of our best varieties, especially yellows, will not stand heat and drought well.

I have for some years past been desirous of getting yellow self-coloured varieties free from any dark blotch or marking, and in Yellow Beauty, Yellow Dwarf, and other kinds I have succeeded, but they are not robust enough in constitution to stand hot dry weather. Queen of Spring is one of the best yellows which has no black blotch in it, and Golden Queen of Spring, a seedling from it, is deeper in colour, a more compact and stouter grower, a very early and continuous free-blooming variety, and

in every way a fine bedder. I find also that *Lutea perfecta*, a sturdy but compact-growing variety of a deep yellow colour, is one of our best hot weather varieties, and an immense bloomer. *Ardwell Gem* is of a primrose colour, of sturdy compact habit, and good constitution, and an early and continuous bloomer, and of a pleasing colour.

In whites, *Countess of Hopetown* must stand at the head of the list as a first-rate variety in every respect, very compact, short sturdy habit, and a great bloomer, flowering early and continuing in flower through the summer. It is a mass of flower with me early in August, notwithstanding the recent hot weather. I cannot speak too highly of this fine variety. *Mrs. Gray* another sterling variety, but a stronger grower, and has a tendency to discolour in hot weather; still it is a telling valuable variety and very fragrant, flowering early, and is a continuous bloomer. These two are our best whites. *Lady Polworth* is another really good white, of sturdy habit and well worth growing. In lilac or mauve coloured kinds *Elegans*, although an old variety, is still one of the very best, of a pale lilac colour, and a great bloomer; but being a strongish grower is more suitable for larger beds. It is a telling, showy, useful variety. *Duchess of Sutherland* and *Fairy Queen* are two capital varieties of a bright silvery lilac colour, and of close habit—viz., early and continuous bloomers and valuable bedders.

In purples and violets I find none more valuable and reliable than *Cliveden Purple compacta*, robust growing and more compact habited than *Cliveden Purple*, from which it is a seedling. It is rich in colour with larger flowers than its parent, and a capital bedding variety. *Queen of Purples* is another descendant of *Cliveden Purple*, and of dwarf compact habit, and a very free bloomer, and a telling bedder both early and late. *Queen of Violets* is of a rosy violet colour, dwarf compact habit and an immense bloomer; in England a first-rate bedder.

In blues a leading place must be given to *True Blue*, really a *Viola* of close sturdy habit and very free blooming, being very early in flower and continuous. It is really a blue and a very valuable bedding variety. *Archie Grant* is a stouter and taller grower, and a later bloomer, being really a late spring and summer variety of a rich blue violet colour, a capital constitution and habit, and a telling variety. *Holyrood* is an old but really striking bedding Pansy of a bluish violet colour, also a late spring and summer bloomer and very effective. *Lord Darnley* is a seedling from *Holyrood* and of closer and dwarfer habit, and of a very rich deep blue violet colour a charming variety. One of the most striking *Violas* grown is *Queen of Lilacs*, a great improvement upon *Blue Bell*, a strong grower, of very hardy constitution, and a wonderful bloomer early and late. This is a variety for masses and is wonderfully effective. *Blue Bonnet* is a striking blue bedding Pansy of the *Blue King* type, and has a dark blotch in the flower; habit close and sturdy, and a very free bloomer.

We have now some most attractive blotched bedding *Violas* in *Countess of Kintore* and *Mrs. D. Hornby*, both very similar in colour and marking, rosy lilac, with large white blotches, but differing a little in habit, the *Countess* being the best of the two. They are very handsome bedders and flower early, and are continuous. *Duchess of Albany* is a new colour, soft shaded puce and lilac, a lovely variety of compact habit, and a free bloomer. *Skylark* is very distinct, white, with a sky blue margin, very pretty, and a good grower and bloomer. There are other varieties which I grow and value, but I have given enough names for a good useful selection to be made from.

I have long been of opinion that *Violas* and bedding *Pansies* will be more and more grown when people understand how to treat them. They should be planted in October or November for early spring work in firm soil and slightly mulched, and in hot weather I also mulch the ground with light manure. *Violas* are glorious from March until the end of June and later, but for summer bedding young plants should be planted in spring, using those which can be lifted with balls of earth if possible. *Violas* are very effective when mixed with *Pelargoniums*—for instance, the pure white *Mrs. Gray* with a pink *Pelargonium*, or the blue and grey *Queen of Lilacs* with yellow *Calceolaria*, and so on. I have seen glorious beds of mixtures in which *Violas* have played a leading part. There are a few stout constitutioned *Pansies* which should be generally grown, and this season has severely tested them as decorative plants. Both here and in a gentleman's garden in the neighbourhood, whose *Dai-ies* were burnt up by the heat, and *Alternantheras* and even *Rhododendrons* and other things were suffering severely, masses of *George Rudd Golden Yellow Pansy* were in luxuriant health and beauty, and I have written it down as a most valuable bedder. *Golden Queen* is a paler yellow and as valuable, and *Captain Hayter* is also a good habited sturdy yellow. White *Pansies* as a rule do not stand

heat well, and with the superb white *Violas* we have that do we do not want white *Pansies*; even *Pilgrig Park*, a half-bred *Viola* and *Pansy*, goes off very much in hot weather. Dark *Pansies* also are not needed so much, as we have very first-rate bedders in the three varieties of hybrid bedding *Violas* I have already named, but many have a great fancy for a very dark velvety *Pansy*, and in *Uncle Tom* this can be had, a short-jointed stiff grower, flower large and good in form, and an abundant bloomer, and stands well.

Many *Violas* and *Pansies* fail from late planting. I am often applied to for plants in June and July, far too late for planting them. Spring planting should not be done later than May if possible. Autumn planting any time from August.—*WILLIAM DEAN, Walsall, Staffordshire.*

[Bunches of the freshest, brightest, and best *Violas* we have ever seen in August accompanied this communication, and they fully justify all that is said about them.]

CLASSIFICATION OF MELONS.

At the majority of shows there are two classes for Melons—one for scarlet-fleshed varieties, the other for green-fleshed sorts; but those who judge often find a curious mixture, and I think the classification requires altering. White-fleshed Melons appear to have become as plentiful as scarlet or green ones, but there is no class for them. As yet they are unrecognised, and they may often be found in both scarlet and green-fleshed classes. I have been told of some judges who have found fine-flavoured and handsome fruits in both classes, but they would have nothing to do with them, as they were neither scarlet nor green, and they were passed by in favour of inferior fruits of the specified colour. There is surely a mistake here, and something ought to be done to rectify it. For my own part I have always been in favour of taking them in when found worthy of it, especially in the green-fleshed class, but it would be better if the prizes were offered for "green or white" fleshed varieties. Many societies might not be able to see their way clear to add another class for whites, although I believe they would often be the best filled, but if the two were specified as suggested above it would do justice to deserving fruits and give all concerned a clear idea what to do.—*J. MUIR, Margam Park, S. Wales.*

WILT'S HORTICULTURAL SOCIETY.

AUGUST 20TH.

THIS, the first Show of the above resuscitated Society which has been held for twelve years, was opened in the episcopal grounds, Salisbury, on Thursday last. It would be hard to find a more suitable place for holding such an exhibition than the well-kept grounds, trim lawn, and well filled and arranged flower beds opposite the south front of the palace, and the shady walks under the shadow of the beautiful Cathedral. The Show was pronounced to be a great success in every respect, and should its future prosperity be correctly foreshadowed by its re-opening display, it will ere long rank among the first exhibitions in the south and west of England. The position of Salisbury is a central one horticulturally; moreover, the Lord Lieutenant of the county (the Earl of Radnor), the Mayor of Salisbury (Mr. Fulford) and his predecessors in the civic chair, citizens, and neighbouring gentry take a great interest in all matters pertaining to horticulture. The Society, too, is fortunate in securing the gratuitous and able services of Mr. W. H. Williams as its Secretary; and although the redoubtable Mr. Cypher did not appear, his place was ably filled in the way of staging grand plants by Messrs. Lock, Rann, Willis, and Mould. Fruit was well represented by supplies from Longford Castle, Marston, Longleat, Clarendon Park, and Rood Ashton, as a perusal of the prize list will show.

PLANTS.

In the class for twelve stove and greenhouse flowering plants Mr. Lock gardener to B. W. Cleave, Esq., Crediton, Devon, was a good first, showing a grandly flowered lot of even, fresh, well-trained plants. His *Ixoras* Duffi and Williamsii, *Dipladenias* amabilis and Brearleyana, *Clerodendron Balfourianum*, and *Ericas* Fairreana, Eweriana superba, and Marnockiana, 6 feet through, were all grand specimens of good culture. Mr. J. F. Mould, Pewsey, was second, his best plants being *Ixora regina*, *Dipladenia amabilis*, *Bougainvillea glabra*, and *Erica Austiniana*; third Mr. Wills, gardener to Mrs. Pearce, The Firs, Bassett. His collection contained the best plant of *Statice profusa* in the Show, it being perfect in form, densely flowered, and 5 feet over. A superbly flowered *Bougainvillea glabra* was also very telling in this collection. For twelve fine-foliage stove and greenhouse plants, Mr. Rann, gardener to J. Warren, Esq., Hand Cross Park, Crawley, was a good first, showing highly coloured *Croton interruptus*, 9 feet over, and C. Warreni, equally well coloured, but a trifle smaller, a large *Latania borbonica*, a fine *Gleichenia rupestris*, and a handsome *Cycas revoluta*. Second Mr. Lock, whose best plants were *Gleichenia Spelunca*, 6 feet over; *Croton Williamsi*, C. Weismanni, and *Latania borbonica*. Third Mr. Wills, with smaller but fresh well-grown plants. Two extra prizes were awarded in this class, one to Mr. C. Penfold, gardener to General Sir F. Fitzgram, Leigh Park, Havant, Hampshire, and the other to Mr. Mould, who both showed good collections. Mr. Lock was placed first for six stove and greenhouse flowering plants, and Mr. Mould second; and for a like number of fine-foliage stove and greenhouse plants Mr. Lock was to the front again, his best plants in this class being grandly coloured *Crotons* Disraeli and Truffautianus; second Mr. Wills; third Mr. F. Smith, the Palace Gardens, Salisbury, both showing well.

For nine exotic Ferns and Mosses Mr. Lock was once more to the front, showing grand plants of *Davallia polyantha*, *D. Mooreana*, each 6 feet through, and beautifully fresh; a fine *Nephrolepis davallioides furcans*.

Second Mr. Wills, whose best plants were *Microlepis hispida cristata* and *Adiantum cardiochloënum*; Mr. Penford and Mr. F. Smith being placed equal thirds. Mr. R. West, gardener to J. R. Wigram, Esq., Northlands, Salisbury, was the only exhibitor of six Zonal Pelargoniums, distinct, and for a like number of variegated-foilage Pelargoniums Mr. Wills and Mr. West were placed first and second in that order. Mr. C. Warden, gardener to Sir F. H. Bathurst, Clarendon Park, Salisbury, was the only exhibitor of six pots of Liliun, and he was deservedly awarded the first prize. Mr. West was first for six Begonias; Mr. H. Wells, gardener to Dr. F. W. Coates, Salisbury, second; and Mr. J. Davidson, gardener to T. H. Staples, Esq., Belmont, Salisbury, third.

CUT FLOWERS.

These were shown largely, and for the most part well. For twenty-four single trusses of Roses Mr. C. Warden was a good first, showing a very fresh even lot of blooms, which, seeing that such veteran growers as Dr. Budd of Bath and Canon T. W. Girdleston, Sunningdale, were placed second and third in that order, reflected great credit on the grower. For twelve blooms the first prize went to Mr. West, the second and third not being awarded. For twelve Dahlias, distinct, first not awarded. Second Mr. J. Evans, gardener to Lady Ashburton, Melchet Court, Romsey. There was good competition in the class for eighteen bunches of cut flowers, distinct. Mr. F. Thomson, Norman Court Gardens, Salisbury, and Mr. C. Penfold were placed equal firsts, the former staging good blooms of *Cattleya crispa*, *Ixora Williamsi*, *Pancratium fragrans*, and *Dipladenia amabilis*. The most noteworthy feature in Mr. Penfold's stand being an immense bloom of the *Victoria regina* Lily, which, as is well known to many of our readers, is grown so well at Leigh Park. Third Mr. Evans.

FRUIT.

There were four collections of eight kinds of excellent fruit staged. First, Mr. H. W. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, followed closely by Mr. W. Iggulden, gardener to the Earl of Cork, Marston House, Frome; and Mr. A. Miller, gardener to W. H. Long, Esq., M.P., Rood Ashton, Trowbridge. Mr. Ward's collection consisted of Alnwick Seedling and Muscat of Alexandria Grapes, Dr. Hogg Peach, Pine Apple Nectarine, Moor Park Apricot, Brunswick Fig, Smooth Cayenne Pine Apple, and Captain Lark's Melon. Mr. Iggulden's best dishes being a good Smooth Cayenne Pine, Grosse Mignonne Peaches, Pine Apple Nectarines, and Black Hamburg and Foster's Seedling Grapes. Barrington Peaches, Apricots, and Eastnor Castle Melon were Mr. Miller's best dishes.

Grapes.—Out of seven stands of three bunches of Muscat of Alexandria Mr. Pratt, gardener to the Marquis of Bath, Longleat, Warminster, was easily first with three magnificent bunches, weighing in the aggregate about 11½ lbs. Mr. Warden, gardener to Sir F. H. Bathurst, Bart., Clarendon Park, Salisbury, was second, and Mr. J. Evans, gardener to Lady Ashburton, Melchet Court, third. Mr. Pratt was again to the front with three large well-finished bunches of Black Hamburg, about half a pound heavier than the Muscats. Mr. Iggulden was an excellent second, showing smaller, compact, and perfectly finished bunches, Mr. Warden being a good third. Seven exhibitors staged. With three bunches any other black variety than Hamburg, Mr. Warden was placed first with well finished Madresfield Court; and Mr. Ward second with Alnwick Seedling. In the class for any other white variety than Muscat of Alexandria, the last-named exhibitor was first, showing three perfect bunches of Buckland Sweetwater, the central one weighing 4½ lbs., and those on either side of it 4 lbs. each. Mr. A. Miller was second, with Foster's Seedling. Mr. Ward staged, not for competition, eight bunches, consisting of two Muscat of Alexandria, two Madresfield Court, Black Prince, Gros Maroc, Alnwick Seedling, and Foster's Seedling, one bunch of each.

Mr. G. Lock was first for a Pine Apple, showing a fine Smooth-leaved Cayenne; and Mr. Ward was second with Providence. Mr. Iggulden had the best-flavoured Melon, showing a beautifully netted and well-coloured fruit of Hero of Lockinge; and Mr. Thomas Wilkins, gardener to Lady Theodora Guest, Iwood House, Henstridge, was second. Six fruits were staged. Mr. F. Thomson, gardener to W. Baring, Esq., Norman Court, had the best six Peaches in Barrington, and Mr. Ward the second best with Bellegarde. Mr. Thomson was again to the front with Nectarines, showing an even dish of Elruge; and Mr. Miller was a good second with same variety. The last-named exhibitor had the best twelve Plums, and Mr. Ward the second best, the former showing a fine dish of Green Gage, and the latter Old Orleans, the third prize going to Mr. Iggulden. For Apples, three dishes of dessert and a like number of kitchen varieties, Mr. Evans was awarded first honours, Mr. Iggulden second, and Mr. F. Smith, the Palace Gardens, Salisbury, the third; but in the opinion of some the first and second awards in this class should have been reversed. Mr. F. Smith was the only exhibitor of four varieties of Pears, and he was deservedly awarded first honours for clean even fruits of Louise Bonne of Jersey, Marie Louise, Williams' Bon Chrétien, and Jargonelle.

VEGETABLES.

These were shown largely and well for the season, there being no less than nine exhibitors. The first prize was secured by Mr. F. Wilkins, who, in his first attempt in this class of garden produce, staged excellent samples of Autumn Giant Cauliflower, Intermediate Carrot, Girtford Giant Bean, International Kidney Potato, Wright's Giant Perfection Celery, Student Parsnip, Reading Tomato, Purley Park Hero Cucumber, Gladiator Peas, White Elephant Onion, Purple Globe Artichoke, and Pragnell's Exhibition Beet. Mr. A. Miller was a good second, his best dishes being Stamfordian Tomatoes and Autumn Giant Cauliflower; and Mr. Richards, gardener to the Earl of Normanton, Somerley House, Ringwood, was a good third. Mr. Pope, gardener to the Earl of Carnarvon, Highclere Castle, Newbury, was the only exhibitor of a collection of six varieties of salading, and for which he was awarded a first prize. There were no classes provided for single dishes of vegetables, such as French Beans, Tomatoes, Peas, and Cucumbers, an omission which we hope will be remembered when the next schedule is being framed.

AMATEURS' CLASSES.

These were fairly well contested, and the exhibits on the whole moderately good. Mr. J. Curry, gardener to Colonel Pepper, Salisbury, being the

only exhibitor of six stove and greenhouse plants, was awarded a first prize for the same; and for a like number of F ras the first prize went to J. W. Lovibond, Esq., Salisbury, for a good collection; the second to Mr. H. Gregory, Fisherton Mills, Salisbury; and the third to Mr. J. Curry. The last-named exhibitor was the only contributor of six pyramically trained Coleuses, and for which he was awarded first prize, his plants being small but beautifully coloured. Mr. Gregory was the only exhibitor of three pots of Liliun auratum, and to them was awarded chief honours. Mr. Curry secured first prize for six Zonal Pelargoniums, and Mr. Lovibond first for four variegated-foilage plants of the same old-fashioned but popular flower.

Fruits.—For two bunches of black Grapes Mr. G. H. Farrant, Bemerton, was first for fairly good bunches of Black Hamburg; second Mr. Gregory with the same variety, the third going to Mr. J. Curry. Mr. Lovibond was easily first for a like number of bunches of white, showing Muscat of Alexandria, the second and third going to Mr. Gregory and Mr. Curry in that order, both showing Foster's Seedling. Mr. Gregory had the best-flavoured Melon, showing a well-coloured and neatly netted fruit of Dr. Finch—a locally named variety of the Blenheim Orange type. Mr. Lovibond had the best dish of Peaches; and Mr. Guillaume, Oriental Place, Southampton, the best dish of Plums; and Mr. C. Mood, Salisbury, had the best three dishes of culinary Apples, and Mr. G. Smith, Salisbury, was second.

LADIES' CLASSES.

As is usual at the majority of exhibitions, the ladies' classes were well contested, and the arrangements for the most part were extremely light and graceful. For a dressed flower vase for the decoration of the dinner-table, the first prize was awarded to Mrs. Farrant, Bemerton, with a rather massive arrangement. Second Miss Prewett, Hammersmith; and third Miss Bessie Flight, Winchester, for an extremely light and admirable arrangement, and which, in the opinion of many competent judges, should have been accorded the premier award—that is, it should have changed places in point of merit with the heavy arrangement that was placed first. Miss Griffin, Wilton Road, Salisbury, had an extra prize given to her stand. For a dressed vase for decoration of drawing-room, the awards were more consistent with the merit of the individual arrangements. First Miss A. Flight with an elegant arrangement. Second Miss Lovibond. Third Miss Griffin. For three buttonhole bouquets, first Miss Prewett, second Lovibond, third Mrs. Brittain, Salisbury, all displaying good taste in their arrangements. In the class for ladies' shoulder sprays Miss Prewett was to the front once more for a neat combination of lightness, colour, and simplicity. Second Miss Staples, Belmont, with light and excellent sprays. Third Mrs. Brittain, an extra prize being given to Miss Mathews, Quidhampton.

MISCELLANEOUS.

The principal feature in this class was the magnificent collection of Roses, Dahlias, and Gladiolus staged by the well-known Castle Street firm, Messrs. Keynes, Williams & Co., and which made quite a grand display in themselves, the whole of them being so good as to render the singling-out of any particular variety or bloom quite superfluous. Messrs. Cross & Steir of The Canal, Salisbury, also put up several excellent stands of Roses, The Governor, and Gloire de Nancy Carnations. Mr. King, florist, Western Road, Lymington, showed some excellent blooms and small plants of double and single Begonias as also did Messrs. Brittan & Son, of the Waterloo Nursery, Salisbury. Several stands of good Roses, and some plants of Liliun auratum from Longford Castle Gardens helped to give effect to the two tastefully arranged tents.

FRUIT AT CHISWICK.

It is a long time since the fruit crops, of Pears especially, were so fine in the Royal Horticultural Society's Gardens as they are this season. The pyramid trees, which are very numerous, are models of their kind, the majority appearing to be from 12 feet to 15 feet high, the main branches thinly and regularly disposed, yet so sturdy and strong that it is rare to find one dragged down by the weight of the fruit.

The trees have all been summer-pruned for some time past, and the fruit is displayed to the best advantage, and receives the full benefit of the sun. Many of the trees that are bearing so heavily have the soil "dished" for 2 or 3 feet round the stems, so that water could be given more effectively, and in addition those bearing the heaviest crops have been thickly mulched with manure. But for this assistance the fruit could not have been supported; as it is, some is rather small in consequence of the serious and protracted drought; still, should rain fall soon and copiously, the fruit will swell considerably. The value of the attention given is manifest by the condition of trees that have not been assisted in the manner indicated, for it was impossible to water and mulch all of them; in fact, the outlay would not have been justifiable in the case of trees on which the crops are light, and these trees are flagging by the drought, while those assisted are fresh notwithstanding the great weight of the crops they are bearing. It is quite apparent that if these trees had been left to "take their chance" the fruit would have been comparatively worthless and the trees exhausted, whereas the crops are of substantial value, and the trees, with few exceptions, are capable of bearing similar crops next year.

It is customary to water and mulch Roses, Dahlias, and other flowers for the production of fine blooms, but as a rule even heavily borne pyramid and bush fruit trees in gardens receive no such assistance. That is a mistake, for fruit trees benefit by extra support accorded them as markedly as flowering plants do, and give at least an equal return to the cultivator for his care.

A number of dwarf Apple trees worked on the French Paradise and Doucin stocks some half a dozen years ago are marvels of productiveness. They are simply clustered with fine, clear, well-fud fruit, and it has been necessary to assist the branches to bear the weight of the crop. The condition of the trees strikingly show the relative influences of the stocks on

which the varieties are established, and nearly if not in every instance the superiority of the Doucin is apparent. The trees are planted 3 feet apart in rows, say a dozen trees on one stock and a similar number on the other in the same row, all having been grafted on the same day. The crop of the valuable Stirling Castle Apple is prodigious, but while the trees on the Doucin are twice the size of those on the Paradise and equally fruitful, it is evident those on the latter stock will not continue healthy and productive for many years. Of Cellini there is a splendid crop of excellent fruit, the trees on the Paradise being 2 to 3 feet high, those on the Doucin 4 to 5 feet, the larger bearing fruit as freely as the smaller. Yellow logestrie on the Doucin is laden with its small golden fruit, and it is clear the stock suits this favourite market dessert Apple. Cox's Orange Pippin is excellent on both stocks, if anything the fruit being a trifle finer on the Paradise, but it is only a trifle, and the larger, healthier, yet fruitful trees on the Doucin show this to be the more serviceable stock. On the same stock the valuable and almost certain bearing Apple, Small's Admirable, is healthy, though the branches are wreathed with fruit, which is finer than on the smaller trees on the Paradise. New Hawthornden is very fine and colouring well on the Doucin, good, but not so well coloured on the Paradise. Van Mons Reinette, on the Doucin, is free and upright in growth, and bearing an excellent crop of attractive fruit. Baumann's Red Winter Reinette is bearing large beautifully coloured fruit, red all over, and would be tempting in the market in winter. Young trees of Lane's Prince Albert on the Paradise are healthy and bearing well, and it is evidently an excellent variety for fruiting in a small state. Stone's Apple or Loddington Seedling is not well adapted for bushes, being loose and irregular in habit. The crop is light, but fruit fine. Lord Suffield is very fine indeed, but no Apple in the collection attracts more notice than the Duchess of Oldenburg, which must be regarded as one of the most handsome and useful of early Apples. The fruit is large, pale yellowish green, marked all over with distinct red streaks. It is quite ripe now (August 24th), and is unsurpassed for culinary purposes, and not to be despised for dessert. It is a thoroughly good Apple, and the tree grows well and bears freely. This experimental quarter of Apples is both attractive and instructive, and is worthy of inspection by all who can visit the Gardens at the present time.

The Plum crop is variable. Samples were being gathered for the exhibition at South Kensington, but only a few were quite ripe. Oullins Early, however, was over, and Mr. Barron regards it as one of the best early yellow Plums. Angelina Burdett is one of the most delicious purple Plums; Bradshaw is one of the largest dark varieties; and the most productive of all, regardless of colour, is the well-known and very serviceable Denyer's Victoria.

Under glass there are plenty of Grapes. The large vinery is well furnished as usual with useful bunches, and as some persons take an interest in Vine vagaries, it may be noted that a Vine of the Gros Guillaume, trained horizontally with rods taken upright at intervals, appears as if bearing a succession of fruit, the fruit on the rod most distant from the root being black, that on the rod directly over the root green and small, while on the intervening rods the bunches are more or less coloured according to the position of the rods, the colour deepening according to their distance from the main upright stem or root of the Vine.

But the Vines most deserving of mention are the Gros Colmans with a few Alnwick Seedlings in the long corridor-like house. They are in first-rate condition this year, far better than usual, with thick healthy foliage and large rapidly swelling fruit. The border was thickly covered with rich manure some weeks since, and this having been kept constantly moist—not with mere sprinklings, but heavy supplies of water—has been taken possession of by a mass of feeding roots, which are bristling through the surface and doing good work for the Vines and crop. If this plan of mulching were adopted more generally, instead of having the surface of Vine borders loose and dry, there would be fewer complaints about failing Vines and inferior Grapes.—A VISITOR.

NATIONAL CARNATION AND PICOTEE SOCIETY. (NORTHERN SECTION.)

THIS Show was held as usual in the Town Hall, Manchester, and with the prize list a correspondent sends the following remarks:—

"The Show was as a whole very bright in bloom, but short in quantity of flowers. Only eighteen exhibitors were able to come up. The date was too early for some of the cold north districts. Mr. Lord's flowers were the best in general condition and splendid examples of sound culture."

The following is the list of awards:—

For twelve Carnations all dissimilar.—First, Mr. R. Lord with Curzon, John Harland, Ranger Johnson, Hextall, Sybil, E. S. Dodwell, James Douglas, Clipper, Mrs. Dodwell, E. Adams, Unexpected, Mercury; second, Mr. B. Simonite with Sybil, Sarah Payne, Florence Nightingale, A. Medhurst, H. Cannell, Master Fred, J. Douglas, seedling (Simonite), seedling (Horner's No. 6 rose flake), Joseph Crossland, Sportsman, and a seedling; third, Mr. G. Geggie, whose best flowers were Master Fred, W. Skirving, Sybil, and J. Douglas; fourth, Mr. F. Law, whose best flowers were Squire Meyne, J. D. Hextall, Sybil, and J. Douglas.

For twelve Picotees all dissimilar.—First, Mr. R. Lord with Mrs. Lord, John Smith, Ann Lord, Thomas William, Clara Penson, Master Norman, Loddington Favourite, Miss Wood, Mrs. Niven, Zerlina, R. Scott, and Elise; second, Mr. B. Simonite with Constance Heron, Mrs. Gorton, Brunette, two seedlings, John Smith, Princess of Wales, Dr. Horner, Mrs. Nevin, Muiel, J. B. Bryant, and Mary; third, Mr. G. Geggie, whose best flower was Clara Penson; fourth, Mr. F. Law, whose best flowers were Clara Penson and Mrs. Gorton.

For twelve Carnations, nine to be dissimilar.—First, R. Gorton, Esq., with E. S. Dodwell, Skirving, Merryweather, Foster, R. Johnson, Master Fred, Harrison Weir, G. Adams, and F. Nightingale; second, Mr. J.

Bleackley, with Master Fred, J. Douglas, Sybil, Sportsman, Falconbridge Curzon, Clipper, Keats, Lord Napier, Squire Llewelyn, and M. Nottingham.

For twelve Picotees, nine to be dissimilar.—First, Mr. J. Bleackley, with Brunette, Zerlina, Thomas William, Edith Dombrain, Alliance, Her Majesty, Liddington Favourite, Miss Wood, and another; second, Mr. J. Whitham, with Zerlina, J. B. Bryant, Clara Penson, Miss Horner, Thomas William, Miss Wood, Brunette, John Smith, Ann Lord, and Edith Dombrain; third, R. Gorton, Esq.; and fourth, Mr. W. Slack.

For six Carnations, all dissimilar.—First, Mr. J. Whitham, with E. S. Dodwell, Lord Raglan, Tim Bobbin, Curzon, J. Douglas, and H. Cannell; and second, Mr. G. Thornley, with Curzon, Raglan, Squire Trow, J. Douglas, Clipper, and Keats.

Six Picotees, all dissimilar.—First, Mr. E. Shaw, with Daisy, Clara Penson, Alice, Her Majesty, Miss Horner, and Miss Wood; second, Mr. G. Thornley, with Mrs. Rudd, Nymph, Miss Horner, Mrs. Prescott, Burdett Coutts, and Norfolk Beauty.

Extra class for twelve fancies.—First, Mr. R. Lord; and second, Mr. F. Law.

Premier Carnation.—Curzon from Mr. R. Lord.

Premier Picotee.—Zerlina from Mr. J. Bleackley.

SINGLE SPECIMENS.

Scarlet Bizarre Carnation.—Mr. R. Lord, all the prizes with Curzon.

Crimson Bizarre Carnation.—First, R. Gorton with Harrison Weir; second, G. Geggie with Master Fred; third, J. Bleackley, with E. S. Dodwell; fourth, G. Geggie with Master Fred; fifth, R. Lord with Master Fred.

Purple Bizarre Carnation.—First, J. Whitham with E. Dodwell; second, S. Barlow with Sir G. Wolseley; third, J. Whitham with H. Weir; fourth and fifth, R. Gorton with H. Weir and W. Skirving.

Scarlet Flake Carnation.—First, G. Geggie with H. Cannell; second, B. Simonite with Tom Powell; third, J. Bleackley with Sportsman; fourth, J. Chadwick with Ivanhoe; fifth, B. Simonite with seedling.

Rose Flake Carnation.—First, R. Lord with J. Keats; second, W. Taylor with Crista Galli; third, G. Geggie with Crista Galli; fourth and fifth, W. Taylor with Crista Galli.

Purple Flake Carnation.—First, B. Simonite with J. Douglas; second, G. Geggie with M. Nottingham; third, F. Law with J. Douglas; fourth, J. Bleackley with M. Nottingham; fifth, G. Thornley with Squire Trow.

Heavy Red Picotee.—First, G. Geggie with Master Norman; second, R. Gorton with John Smith; third, W. Taylor with John Smith; fourth, W. Taylor with Brunette; fifth, G. Geggie with Haversley.

Light Red Picotee.—First, second, third, fourth, and fifth, R. Lord with Thomas William.

Heavy Purple Picotee.—First, R. Lord with Mrs. Nevin; second, J. Whitham with Zerlina; third, J. Bleackley with Mrs. Nevin; fourth, R. Gorton; fifth, J. Bleackley with Zerlina.

Light Purple Picotee.—First, J. Whitham with Ann Lord; second, G. Geggie with Clara Penson; third, R. Lord with Alice; fourth, J. Bleackley; and fifth, E. Shaw, with Clara Penson.

Heavy Rose Picotee.—First, second, and third, R. Lord with Mrs. Lord; fourth, G. Geggie, and fifth, F. Law, with Miss Horner.

Light Rose Picotee.—First, third, fourth, and fifth, R. Lord with Miss Wood, Elegant, and Miss Horner; second, J. Whitham with Miss Wood.

HERBACEOUS PLANTS.

I AM too fond of these plants to find fault needlessly with those who advocate their culture, and if therefore I have to dissent from your correspondent, "N. R.," he may rest assured that it is in no captious spirit that I do so, but with as earnest a desire as he himself has that their culture should be extended.

I have long concluded that service, and good service too, would be done to the cause, if not only plants that were good should be recommended, but that those of inferior merit should be pointed out, that they might be avoided, and I fear your correspondent will think me a "gone coon" when I say that long ago I tabooed *Liatris spicata*, and turned it out of my garden, and that too for the very reason that he praises it. It does commence to bloom at the top, and the consequence is that as the spike progresses in flowering you have a collection of dirty-looking dead flowers at the top, and a very few at a time in flower below that. Nor is to me the colour a taking one, being of a very dull purple—so do tastes differ! As to massing it, I cannot conceive, for the reasons I have stated, a more undesirable plant; but what perplexes me above all is his praising *Inula glandulosa* as one of the most beautiful blues we possess. A lovely and most desirable plant it is, but it is of the richest orange yellow, soft and exquisite in its form, falling over like tassels of brilliant-coloured silk. What plant can he mean? I have not gone on my own knowledge only of the plant, but I have consulted various catalogues, and all give the same description. The plant at this season for blue is *Platycodon grandiflorum*, a plant allied to *Campanula*, with large open flowers of a beautiful blue colour. It seems to be rare, for I do not find it under that name in either Paul's, Ware's, or Backhouse's lists. There is a dwarf variety of it which I have not seen.—D., Deal.

SPECIALTIES AT THE ANTWERP SHOW.

NOTABLE PLANTS.

RUBUS AUSTRALIS.—The settlers in the great southern continents have bestowed a very characteristic name upon a plant which grows rather plentifully in some parts, and which probably proved an unpleasant acquaintance when clearing fresh ground became necessary. The plant is *Rubus australis*, and the popular title is "Lawyers," which is said to have been given to it because, owing to the large number of small curved spines that clothe the stems and leafstalks, it holds fast those who come in contact with it, and few manage to release themselves without suffering personal damage. Whether the name is appropriate or

not matters little; the plant is a peculiar one, and is grown in botanic gardens and other collections of singular plants chiefly as a curiosity, though we rarely see a plant of more than a few feet in diameter, and that is quite large enough for most gardens. At Antwerp, however, an extraordinary specimen was shown, and it is doubtful if there is such another example in cultivation. This was of columnar form, about 3 feet in diameter and 12 feet high, a dense mass of growth the whole height, and so plentifully armed with its sharp little white spines as almost to deserve the title "ferox," which botanists bestow upon some of the most formidable plants. It was exhibited by Madame Olivier Le Jeune, Château de Trogenten, Berchem, who was awarded a silver medal for it in the class for an ornamental-foliage plant, and no doubt she is proud of her plant as a unique specimen of its kind.

COCCOLOBA PUBESCENS.—In many English gardens may be seen a curious and interesting little plant named *Coccoloba platyclada*, which is remarkable for its strangely flattened leafless branches, that look as if they had been very carefully pressed out with a heavy iron, or as if some antiquated herbarium specimen had been suddenly resuscitated without having time to resume its normal rotundity of stem or fill its vessels with sap. Between this plant and that named at the head of the paragraph, *Coccoloba pubescens*, the contrast is very striking, and though visitors to the Antwerp Show had not the opportunity of seeing the two plants together, yet those who remembered the little plant in collections at home could not help remarking how great was the difference between them. *C. pubescens* was shown by several exhibitors in capital condition, notably by M. Pierre F. Boutmans, of the Lille Botanic Garden, who obtained a silver medal for it, and by M. A. Dallièrre of Ghent, who had it in a class for three foliage plants, and gained a silver-gilt medal. These were large specimens 10 feet high or more, and the immense leaves, 2 or 3 feet in diameter, clasp the stem closely at the base, imparting a most strange appearance to the plant, especially as they have a rough "hullated" or Savoy-like surface. In a few botanical collections it may be seen in England, and then, perhaps, as at Kew, can also be seen the *Grias cauliflora*, which has even larger leaves, but scarcely has a more peculiar appearance.

A VARIEGATED PALM.—The two large families of Palms and Ferns do not give us many examples of variegation, and the former have still fewer than the latter, for amongst the Ferns, especially in the Pterises, occur some cases of diverse colouration, whereas any approach to this condition is very rarely seen in the Palms; therefore the plant shown by M. Arthur de Smet, Ghent, named *Areca Baueri variegata*, possessed some interest as a departure. It was, however, very young, being described as a seedling of the present year, and in consequence, though there were evident signs of variegation, it would be quite impossible to say whether it would be likely to keep this character as it developed; still we may hear something more about it, and really well-marked variegated Palm would be a good addition to our foliage plants, though even if the variegation were fixed in one plant it is not very clear how it could be propagated.

CARNATION SOUVENIR DE LA MALMAISON.—At Kensington recently we had a grand exhibit of these handsome Carnations recently from vigorous plants with abundant beautiful flowers, but it was satisfactory also to find that in Belgium the culture of these useful plants is also understood, and that they are as highly appreciated as they are here. M. B. de Lombaerde, 52, Rue de Jérusalem, Schaerbeek, had some particularly fine plants, and well merited the silver-gilt medal awarded for them; but several other exhibitors had nearly equally creditable specimens, especially notable being those from M. Jean Everaerts, Vieux-Dieu, who contributed so liberally from his charming garden, though the same exhibitor had some admirable groups of *Gloxinias*, *Colenses*, and *Pelargoniums*; the Carnations were unquestionably the best, and their culture is evidently well understood by M. Everaerts.

It is not necessary to make special reference to any others of the numerous notable plants exhibited, but a few words as to the general system of management may be given, especially as some reference has already been made to some slight shortcomings as viewed from a British standpoint. In the first place there is one regulation which is carried out in such a satisfactory manner that it deserves the highest commendation, and this is the labelling of the plants. The great majority of the labels are printed in clear bold type, and the names being correctly spelled they serve an educational use, which is too seldom the case at British exhibitions, where labelling the plants is often left to assistants who occasionally have somewhat erratic ideas in regard to botanical names, and give expression to them in a very peculiar caligraphy, so that between mis-spelling and illegibility visitors who are unversed in the mysteries of plant-nomenclature are not likely to gain very clear notions on the subject. At Antwerp the exhibitors had their cards printed at their own expense, but this even when several hundred plants are shown is not a large outlay, and an ample return is afforded in the satisfaction of having them neatly and correctly named.

The exhibits are distinguished until the judging is completed in a similar manner to that adopted at many of our provincial shows—namely, all are numbered, and those of each exhibitor run consecutively in the order of the classes in the schedule. As the prizes are awarded the numbers of the winning exhibitors are entered in a book under the class by the secretary of each group of judges. This is then returned to clerks, who are entrusted with duty of writing out the prize cards, which are then placed to each exhibit as with us. The system is not so simple and expeditious as that adopted at South Kensington, but it has the advantage, if it can be considered one, of removing all means of determining the respective exhibitors while the plants are being judged, unless the

specimens can themselves be recognised, as must be frequently the case there as it is here. It cannot, however, be commended. Judges should be above all suspicion, and these evident signs of doubt must be unpleasant to all who wish to perform their duties conscientiously.

A word of praise is also due to the excellent catalogue of the exhibits

Fig. 33.—*Sarracenia Patersoni*. (See page 186).

and prizetakers, which considering its size (260 pages), was issued very quickly, being on sale by noon of the opening day, or within twenty-four hours of the time the Judges made their awards. In this the first part was devoted to the names of the exhibitors, under which were given their entries in each class, and in many cases the names of the plants shown. In the second part the classes were given in the order of the schedule, and the names of the prizetakers with reference to their entry number. Full lists of the Jury were also included, and the whole was neatly printed on good paper. Our exhibitions are rarely of sufficient duration to necessitate

a catalogue of this character, but in these few exceptional cases we might well take a lesson from our neighbours in Belgium.—L. C.

VINE VAGARIES.

ON reading what I wrote on this subject last week, I fear I have not made the subject as clear as I should have done. At the end of the second paragraph I write, "We put bottle grafts of the former on each Vine above the junction of the two sorts." I should have written, We put bottle grafts on some above the junction of the two sorts, and on others on one or other of the Vines below the junction and removed the other; thus we have some on the Muscat only, some on the Barbarossa only, and some on the Barbarossa above where it is united to the Muscat, and it is on this latter on which the Grapes are so much later than they are on the single stock of either sort.

In the last paragraph for "every May" read every way.—WM. THOMSON.

IN reference to the NATIONAL PEAR CONFERENCE, Mr. N. H. Townall writes—"Your note appended to my remarks is ominently fair, and just, and needed. With the hope that the lessons learnt at the Congress in 1883 will be carried into beneficial practice at the Pear Conference in 1885, I am satisfied, or shall be."

— WE are desired to state that LORD BEACONSFIELD RASPBERRY, figured in these pages last week, was raised by Mr. Faulkner, Inkpen, Hungerford.

—"T." writes—"The exhibition OF ORCHIDS is greatly extending and the amount of interest and curiosity displayed by the public when viewing them is such as to encourage the hope that a much more general appreciation of, and interest in, these wonderful plants will be developed. With the increased knowledge of Orchids as seen at flower shows, there will, no doubt, come the desire to cultivate them, and the enormous quantities now imported warrant the belief that they will soon—in many cases, at least—be popular plants at popular prices."

— AN edition *de luxe* of Mr. Percy Lindley's "WALKS IN EPPING FOREST" has just been issued, and forms a very pretty volume. It is bound in vellum, with gilt lettering, and is printed on stouter paper than the first edition which we recently noticed.

— MR. RIVERS has sent us some EARLY BEATRICE PEACHES ripened on a STANDARD TREE out of doors at Sawbridgeworth. The tree has been growing for some six or seven years in the same place without any protection whatever. The Peaches were quite delicious in quality, surpassing many that we receive that have been grown under glass.

— SEEDLING DAHLIA PRIZES.—In addition to the Turner Memorial Prize for Dahlias, which is represented by a handsome silver cup value ten guineas, the overflowings of the subscription, which was necessarily limited to Dahlia fanciers, have been devoted to three prizes—£1 : 12s. 6d. : 7s. 6d.—for the best seedlings exhibited at the Crystal Palace Show on the 4th of September next. The prizes are to be additional to the certificates offered in the schedule. The growers of Dahlias should note that this grand National Show will soon be here.

— THE ST. PETER'S, HAMMERSMITH, AND DISTRICT GARDENERS' AND AMATEURS' IMPROVEMENT SOCIETY will hold an exhibition of Chrysanthemums, Fruits, and Vegetables, on Thursday, November 19th, prizes being offered in twenty classes.

— MR. W. J. MURPHY, *Clonmel*, writes as follows concerning THE VARIEGATED TREE MALLOW (*LAVATERA ARBOREA VARIEGATA*). "I have had this singularly beautiful (foliage and flower) plant from Mr. Cannell since its introduction, and cannot at all agree with your correspondent, page 158, though I am satisfied he correctly stated his own experience 'that it cost too much to buy tobacco paper to kill green fly on it,' to grow it indoors. It is suitable for a lawn, growing 5 and 6 feet high; for a cool greenhouse; splendid for a tub near an entrance; and lastly, if properly managed, will, in certain cases, make an admirable window plant. In all those circumstances I never noticed green or black fly on it; but outdoors in summer, fully exposed, I

consider is the proper position for it. Indoors, and shaded, the splendid marble tinting of the foliage is wholly lost."

— A LARGE consignment of FERNS FROM NEW ZEALAND has arrived at Chiswick to be established for arranging at the Colonial Exhibition to be held next year at South Kensington. There are several hundreds of plants, from large trunks of Cyatheas and others of the arborescent group to miniature Filmy Ferns, and a remarkably fine lot of Todeas. These have arrived in admirable condition; in fact very few indeed of the plants sent will fail to grow. A quantity of moss arrived with the Ferns for competing purposes, and this, too, is as fresh as could be expected. The entire consignment must be regarded as very satisfactory, and its magnitude indicates that the products of New Zealand will be well represented at the Exhibition in question, which cannot fail to be extensively varied and interesting.

— GARDENING APPOINTMENT.—Mr. A. Greaves, late foreman at Brantingham Thorpe, has been appointed as gardener to A. K. Rollit, Esq., Thwaites House, Cottingham, Hull.

— THE annual Horticultural and Floral Fête of the GREAT YARMOUTH, EAST NORFOLK, AND SUFFOLK HORTICULTURAL SOCIETY was held on Thursday, the 20th inst., in St. George's Park, Great Yarmouth. The schedule, a very comprehensive and liberal one for a provincial society, offered a large number of money prizes for competition, amounting in all to upwards of £120. The exhibits were arranged in three large marquees in the Park, and the Show as a whole may be said to have been highly successful. The stands of Dahlias, both single and double, the Roses, Grapes, &c., attracted much attention. The principal prize-winners were Messrs. Gilbert & Son, of Ipswich; Messrs. Laws & Son, of Beccles; Mr. Neuman, of Gorleston; Mr. Barnard, of Caistor; Mr. C. Allen, the Marchioness of Lothian, Miss Penrice, Lord Suffield, and Messrs. Daniels Bros.

— THE Editor of the *American Gardeners' Monthly* thus refers to the RAPIDITY OF GROWTH IN TIMBER TREES.—"We have frequently drawn attention to the fact that there will never be a scarcity of timber in our country, because the wide-awake American will be sure to plant as soon as it becomes scarce enough to make it worth while to plant more. The old notion, derived from English works on forestry, that it takes centuries to grow trees to a profitable size, came from the fact that the landed interest of Great Britain know absolutely nothing of forestry, and seldom learn much from outside sources. An American will learn from a single illustration, found anywhere, and profit by it. There is no need to employ no end of commissioners at equally endless salaries, in order to find out how fast our timber is decreasing, and tell us how to keep our old and half-rotten forest trees from failing to the ground 'because it takes ages to get a new supply, you know.'"

SHREWSBURY SHOW.

THE annual summer Show of the Shropshire Floral and Horticultural Society was held in the Quarry Grounds, Shrewsbury, on August 19th and 20th. For several years past it has been our pleasant duty to record an unusually successful Show in connection with this enterprising Society, but the one under notice was admitted to be superior to its predecessors; the whole affair is, in fact, a gigantic undertaking arranged in the best style, and carried out in the most creditable manner. It is a *fête* of great magnitude, at the top of which stands the horticultural Show, then comes a grand feast of music and numerous amusements, with a magnificent display of fireworks at the close of each day; but these by no means overshadow the floral attractions, as the tents were crowded almost beyond their capacity. It has become a well and honourably known institution throughout the Midlands and far beyond them, and the way it is patronised is simply marvellous. Going back to 1876 we find the takings at the gate on the first day amount to £82 4s. 6d., in 1885 £218 9s. 7d. The second day, 1876, £189 5s. 2d.; the second day, 1885, £1074 19s. On Thursday last no less than the last mentioned sum was taken at the gates, the charge for admission being 1s. in the fore part of the day and 6d. in the evening. Besides this £350 worth of 1s. tickets were sold at 9d. previous to the Show to admit on the 20th, and apart from this subscriptions were collected to the extent of about £500. As the income of an ordinary annual Show it is unique. The Society is possessed of a handsome balance, but no miserly course is followed, as everything is done in first-class style, and in recent years over £1000 has been handed over from the funds in benefit to the town of Shrewsbury. These brief facts speak volumes for the interest in horticulture in and around this grand old town. The work of organising and conducting such a gigantic concern must be extremely heavy. There must be few drones in the official hive. Messrs. Adnitt & Naunton of The Square, Shrewsbury, in discharging the arduous duties of Hon. Secretaries in such an admirable manner, prove that they are the right men in the right place; and in connection with the Committee, who are mostly the leading inhabitants of the town and the principal gardeners and nurserymen in the district, display the utmost energy and genuine ability in the performance of their good work, merit congratulation on the eminence to which they have raised their Society.

On the evening of the 18th rain threatened, but the morning of the 19th was bright and promising, and the very important subject of weather, as well as the innumerable details connected with this magnificent Show, passed off without a hitch. The exhibits were arranged in numerous capital tents supplied by Mr. C. R. Clark, Stoke-on-Trent. One of them was 200 feet in length and 80 feet in width. Another was 290 feet in length, and 40 feet in width. Everything was seen and arranged to the greatest advantage.

Taking the classes in the order of the schedule the following were the most important.

PLANTS.

The principal of these were arranged along the centre of the first noted tent, the tall Palms being along the middle, and choice rich flowering and foliage plants near the side, which produced an excellent effect. The first class was twenty stove and greenhouse plants, with prizes of £25, £20, and £15, and they were all taken, Mr. Cypher, Cheltenham, being placed first with superb specimens, amongst which the following were extremely good—*Statice profusa*, finely bloomed; *Croton Queen Victoria*, C. Prince of Wales, C. Sunset, all very rich in colour; *Allamanda nobilis*, *Ixora Pilgrimi*, *Phœnocomma prolifera* Barnesi, 6 feet through, in fine health and grandly bloomed; *Rhododendron Duchess of Edinburgh*, full of orange scarlet trusses, beautiful; *Dasyliion acrotrichum*; *Saccolabium Blumei majus*, *Erica kingstoniensis*, *E. Irbyana*, *E. obbata purpurea*, and several fine large healthy Palms—evidently one of Mr. Cypher's best efforts, but he was followed remarkably close by the twenty from E. C. Glover, Esq., Highfield Hall, Leek (gardener, Mr. C. Roberts), who turned his plants out in fine condition, especially *Dipladenia amabilis* and *D. splendens*, both profusely bloomed and of a capital colour; *Ixora Williamsi*, very large; *Croton majesticus*, *C. angustifolius*, large and fine; *Cycas revoluta*, *Allamanda Hendersoni*, *Ixora coccinea*, *Asparagus plumosus nanus*, large, fresh and graceful; *Anthurium Schertzerianum*, with fifty spathes; and fine Palms. Mr. Tudgey, Waltham Cross, was third, his plants being smaller, but neat. *Anthurium Andreanum* was conspicuous there. In the class for nine stove and greenhouse plants Messrs. Pritchard & Son, nurserymen, Shrewsbury, were first with highly creditable specimens, amongst which we noted a fine *Lapageria alba*, *Erica Eweriana* superba, very beautiful; *E. Marnockiana*, wonderfully bright; *Croton Queen Victoria*, finely coloured; *Latania borbonica*, a small healthy plant; and a grandly bloomed *Bougainvillea glabra*. Mrs. Juson, Abbey Foregate, Shrewsbury (gardener, Mr. Farrant), came second with plants only a very few points behind the first, the best being *Ixora coccinea* superba, *Clerodendron Balfourianum*, *Dipladenia superba*, *Ixora amabilis*, and *Croton pictus*. In the class for six stove and greenhouse plants E. C. Glover, Esq., was first with a fine *Allamanda Hendersoni*, *Phœnocomma prolifera* Barnesi, *Dipladenia amabilis*, *Latania borbonica*, *Croton Queen Victoria*, and *Erica Shannoni*. The plants were smaller than in this gentleman's group of twenty, but finely grown. Mrs. Juson was placed second with larger plants than the first, but not in such good condition. J. S. Burton, Esq., Longner Hall (gardener, Mr. Thursle) was third, his best plant being a very fine *Bougainvillea glabra*, extra well bloomed.

Mr. Cypher was first for six exotic Ferns with a fine *Gleichenia Mendeli*, *Adiantum cardiochæna*, *Microlepia hirta cristata*, a grand plant; *Alsophila australis*, *Thamnopteris Nidus*, excellent; and *Alsophila elegantissima*. E. C. Glover, Esq., followed closely, his best plants being *Cibotium Barometz*, *Davallia solida*, *D. polyantha*, and *Todea superba*. Messrs. Pritchard was third with capital plants. In the corresponding class for six exotic Ferns, open to gentlemen's gardeners, Mrs. Juson came to the front with large healthy plants. J. S. Burton, Esq., was second, and Colonel Wingfield Onslow (gardener, Mr. J. Lambert), third. A fourth prize might very well have been awarded there as the Rev. J. D. Corbet, Sundorne Castle, Shrewsbury (gardener, Mr. R. Milner), exhibited half a dozen excellent plants, which we preferred to either the second or third. Another good half-dozen came from J. Beattie, Esq., Overley (gardener, Mr. S. Bremmel), and on the whole this was an extra well-filled class.

The prizes for six plants in bloom in variety brought out a showy muster, Mr. Cypher being first with *Allamanda grandiflora*, very fresh; *Dipladenia amabilis*, rather soiled; *Erica Irbyana*, capital; *Ixora regina*, *Phœnocomma prolifera* Barnesi, and *Erica æmula*, the whole arranged in one row down the middle of the tent to the pathway, and very effective. Messrs. Heath of Cheltenham were placed second with a group which many judges would have placed first, as it was wholly composed of Orchids in bloom, and first-rate plants—*Pilumna nobilis*, *Cattleya Gaskelliana*, grand; *Dendrobium formosum giganteum*, *Cattleya crispa*, *Saccolabium Blumei majus*, and *Mesospinidium sanguineum*. E. C. Glover, Esq., was third with fine young plants. In Palms Mr. Cypher was first, E. C. Glover, Esq., second, and Messrs. Pritchard third; but as the specimens had been distributed along the middle of the tent and were a little mixed we will not venture to name them.

The *Dracænas*, always a strong class there, were not so numerous this time, but fine in quality. The Misses Bannerman, Roden Hall, Shrewsbury (gardener, Mr. E. Shepherd), being first, and Colonel Wingfield second. *Caladiums* were grand and attractive. Mrs. Juson was first for six plants with large finely coloured specimens, and Messrs. Pritchard was second and third with good plants. These had been exceedingly well managed. With *Coleuses* the Misses Bannerman were first for large pyramidal plants, beautifully coloured; Mr. Laing, Cherry Orchard, being second with very small plants; and the Rev. J. D. Corbet third with plants of the same stamp as the first. The Judges were a little inconsistent there.

The class for six *Fuchsias* were well filled, Messrs. Pritchard being far ahead with magnificent plants, about 5 feet high, as much in diameter, the branches touching the ground, spotless, and profusely bloomed. These plants deserved a more prominent position in the tent. H. Owen, Esq., The Cedars, Shrewsbury, was second with creditable specimens, and Mrs. Juson was third with small plants. Tuberous *Begonias* were scarcely first-rate. Messrs. Pritchard had the best, Misses Bannerman second, and the Rev. J. H. E. Charter, Severn Villa, Shrewsbury, the third. Hardy Ferns were well represented from Mrs. Juson; Mr. J. M. Harding, The Square, Shrewsbury; and Mr. C. Clarke, Belmont, Shrewsbury. In double-flowering and Zonal *Pelargoniums* Messrs. Pritchard had it all their own way, and staged some dozens of grandly grown and abundantly bloomed plants.

The next class completed the large tent, and it is an important one, being a collection of miscellaneous plants to occupy the space of 100 square feet, arranged for effect, and in this Messrs. Pritchard were again to the fore with a truly charming group, in which Maidenhair Ferns, *Crotons*, graceful Palms, and *Liliums* figured attractively. Messrs. Jones & Sons, nurserymen, Shrewsbury, were second and third with well-arranged groups, but *Crotons* predominated too much in both. An unnoticed bed from J. S. Burton, Esq., was much too stiff and closely packed, but not without merit, and all were very much admired.

In coming to the amateurs' plants we find H. Owen, Esq., first for six stove and greenhouse plants with specimens which would hold their own in the open classes at many pretentious shows. *Lapageria rosea* was very fine, and so was *Pandanus Veitchii*, *Allamanda nobilis*, and *Clerodendron Balfourianum*. J. Barker, Esq. (gardener, Mr. G. McReadie), was second, and Dr. E. Burd, Newport House, Shrewsbury, third. W. E. Mansell, Esq., Wellington, was first for four exotic Ferns with *Adiantum cuneatum*, *A. gracillimum*, *Lomaria gibba*, and *Adiantum formosum*. These were in the finest possible health, and attracted much attention, being extra good for the class. H. Owen, Esq., was second, and Mr. George Burr third. Mr. R. J. Nieu, Wellington, also showed well. *Coleus* were excellent from Mr. L. Burd, Mayfield, J. Barker, Esq., and Mrs. Wace, and the same exhibitors secured most of the prizes for *Fuchsias*, *Begonias*, and double and zonal *Pelargoniums*. The *Begonias* were finer in individual blooms here than in the open class. Balsams were poor, and the *Petunias* were not particularly meritorious. The prizes offered for twelve table plants brought out some capital exhibits from Messrs. Jones, Messrs. Pritchard, and Colonel Wingfield. In fifty miscellaneous plants Messrs. Pritchard were first and third, and Messrs. Jones second, both showing what we may term a very choice selection of nursery stock. Altogether inferior specimens were remarkably few, and high quality predominated everywhere.

CUT FLOWERS.

These were arranged on the side stages in the long tent, and were very attractive. The first on the list and on the boards were the *Roses*, and they were about the worst of all the cut flowers. The 19th of August is not a date to expect perfect *Roses* to be shown by dozens, and the twenty-four single trusses shown by Messrs. Perkins, Coventry, and Mr. R. Vertegans, Birmingham, which were placed equal first, were good for the time, but not specially noteworthy; and the eighteens from Mr. E. Wright, Halston, Mr. G. H. Berrington and Mr. G. Townsend, jun., Uffington, were very poor, and it was a relief to get to the *Dahlias*, where we found an excellent display. For thirty-six blooms in variety Mr. Shaw, Kidderminster, was placed first, his best flowers being *Duke of Connaught*, *Monarch*, *Cardinal*, *Modesty*, *Jane Locker*, *George Smith*, and *Mrs. Dodds*. Messrs. Heath of Cheltenham were second with a stand which contained larger and more perfect blooms than the first-prize one, their blooms being extra good and in fine condition. Here General Gordon was greatly admired as a new one of much beauty, and amongst many fine varieties we may name *Gaiety*, *Henry Bond*, *Prince of Denmark*, *James Service*, and *George Dickson*. The class for twenty-four *Dahlias* in variety brought out the best competition, and there Messrs. Heath were easily first with a stand better than in the other class. They were fresh grandly formed blooms, well set up, and we noted *Chorister*, *John Bennett*, *Mrs. Gladstone*, *Joseph Ashby*, *Condor*, and *George Rawlings* as desirable varieties. C. Wright, Esq., Halston Hall (gardener, Mr. H. West), was second with large blooms, and Mr. Shaw was third. Single *Dahlias* were poor on one stand.

With *Gladiolus* Mr. Shaw secured first and third prizes, Colonel Wingfield being placed second with a stand we admired for its freshness.

The *Asters* in all classes were of no special merit, and *Carnations* and *Picotees* might have been better. The twelve bunches or trusses of stove and greenhouse flowers were very beautiful, Messrs. Pritchard being first there and E. C. Glover second. Both exhibits were exceedingly showy. In the class for twelve bunches of hardy herbaceous flowers Mr. Vertegans, nurseryman, Birmingham, was first with a magnificent stand, the flowers being finely developed, very showy, and beautifully set up. Messrs. Jones and Sons were second, and Messrs. Pritchard third, with blooms considerably behind the first. *Phloxes* were numerous, but not high in quality, the majority of the spikes being small. The best came from Miss Emily Cotes, Bickton. French *Marigolds* were very small, but the African *Marigolds* were extra large and very fine, especially from Mr. T. S. Minton and Mr. W. Jones, Montford. *Pansies* had evidently suffered from the drought, and the *Stocks* were deficient in size of spike and distinct colours. *Verbenas*, too, were poor, and this section was the weak point of the Show.

The bouquets were splendid. For a ball or hand bouquet Messrs. Perkins were first with a finely formed one, but we thought the dark *Rose* leaves had been used too freely amongst the white, and one lady who is a very good judge asserted that the colour was entirely unsuitable for many dresses. Mr. Cypher was second with a very choice arrangement, the majority of the flowers being white with a delicate piece of *Cattleya* here and there. Messrs. Jones and Sons were third. The buttonhole flowers were chiefly *Orchids*. The first prize for a stand of cut flowers was won by Messrs. Jones & Sons with a very graceful arrangement, the base being filled with *Orchids*, *Dipladenias*, and *Water Lilies*, and the top was light and elegant. Mr. Cypher was second with a pretty stand, and Messrs. Jones were third. Messrs. Cypher, Perkins, and Jones were the winners for the bridal bouquet, and this section was very attractive. The amateur cut flower stands were mostly spoiled by the glasses being too clumsy.

For Wild Flowers there were three classes, and each was well filled; indeed, the show of these was a good one, and the principal winners were Miss M. M. Goyne, Shrewsbury; Miss Moore, Ellesmere; Miss M. Harrison, Millington's Hospital; Mrs. Jones; and Miss K. James, Wynn's Cottage, Shrewsbury.

FRUIT.

The show of this was excellent in every respect, the entries being more numerous and the quality much in advance of that at any previous show. The bulk of it was arranged along the centre table in the long 290 feet tent, and found many admirers. As soon as judging was over the officials put up a wire netting fence along the front of the Grapes and other fruits, and where the sightseers become such a multitude this plan is very necessary,

and must be much appreciated by the exhibitors. The first class in the fruit section was six bunches of black Grapes, two bunches of three varieties, and there were fourteen lots staged. A capital class. Viewed superficially the best six appeared to be on the stand of the Earl of Harrington, Elvaston Castle, Derby (gardener, Mr. Goodacre), who had two very fine bunches of Muscat Hamburg and also good Black Hamburgs; but Madresfield Court, his other variety, was quite green near the footstalks, and no doubt this led the Judges to award the first prize to Joseph Evans, Esq., Hurst House, Prescott, Lancashire (gardener, Mr. A. Young), who had six large finely ripened bunches of Black Hamburg, Madresfield Court, and Alicante in wonderful condition for the season. These were perfect and even, and had been grown with great care. The Earl of Harrington followed with those just spoken of, and the Rev. Walter Sneyd, Keele Hall, Stafford (gardener, Mr. J. Wallis) came third with good Madresfield Court, Muscat Hamburg, and Black Hamburg. Three prizes only were offered, but the exhibits being so meritorious the Judges awarded a fourth prize to Major J. S. Thursby, Llandudno (gardener, Mr. C. Joseph), whose bunches were certainly not large, but the berries were uncommonly fine. Colonel Wingfield was first for three bunches of black Grapes with Black Hamburg, finely coloured, good in size of bunch and berry, and well finished. The Hon. C. H. Wynn, Rug Corwen (gardener, Mr. J. Bennett), was second with three beautiful clusters of Alnwick Seedling. They were perfectly coloured, carried a deep bloom, and were very attractive. H. Baxter, Esq., J.P., The Tower, Rainhill (gardener, Mr. J. Brotherton), was third with Madresfield Court, very fine in berry, and well finished. A fourth prize was added for the Alicante from Viscount Combermere, Combermere Abbey (gardener Mr. N. E. Owen), and a fifth prize to Mr. I. Roberts, Stourbridge. The finest Hamburgs in this class came from H. W. Foley, Esq., Prestwood Hall, but they were weak in colour and bloom. The Misses Bannerman also showed well in this class.

In the white Grape class four bunches of two varieties, Joseph Evans, Esq., was again first with Muscat of Alexandria, very good in bunch and ripe; and Foster's Seedling, very fine in bunch and finish. J. Corbett, Esq., M.P., Droitwich (gardener, Mr. R. Parker), was second with Golden Champion, rather loose in the bunch, but large in berry and spotless; and Muscat of Alexandria, small in berry, but good in quality. S. Meakin, Esq., The Hazes, Stone (gardener, Mr. Wilkes), was third with Muscat of Alexandria and Foster's Seedling; and the Rev. W. Sneyd was fourth with moderate Duke of Buccleuch and good Muscat of Alexandria. The Rev. J. D. Corbet exhibited strongly here, his Buckland Sweetwater bunches being very good. In the three bunches of white Grapes class James Watson, Esq., Berwick House, Shrewsbury (gardener, Mr. J. Purser), was an easy first with the finest coloured Muscat of Alexandria in the Show. The berries were large, bunches if anything too thin, but the colour was superb. The Misses Bannerman followed with bunches of the same style. H. Baxter, Esq., was third with Muscat of Alexandria, very fine in the bunch, as were the fourth-prize Grapes from the same gentleman. The highly respected President of the year, Sir V. R. Corbet, Acton Reynold (gardener, Mr. J. Hawkesford), was fifth with Muscat of Alexandria, very large in bunch, but rather uneven in berry, and not quite ripe. E. C. Glover, Esq., staged some good examples of Duke of Buccleuch; and Sir C. R. Boughton, Downton Hall (gardener, Mr. H. E. Kennedy), a good specimen of Buckland Sweetwater. The Grapes from the amateurs, especially those from Mr. Blakeway Phillips, Hanwood, and Mr. George Burr, were very good.

For the collection of twelve dishes of fruit there were five competitors. Last year there was not one. The Earl of Harrington was first here, the weightiest dishes being two beautiful bunches of Muscat Hamburg and good Muscat of Alexandria Grapes, and a Charlotte Rothschild Pine Apple of fine shape weighing $7\frac{1}{2}$ lbs. Other good dishes were Hero of Lockinge Melon, Goshawk Peaches, Pine Apple Nectarines, Moor Park Apricot, De Montfort Plum, Morello Cherry, Garibaldi Strawberry, Doyenné d'Été Pear, and White Dutch Currants, by no means a strong dish in a collection of twelve sorts, but the first named brought up the points. J. Corbett, Esq., M.P., was a very close and good second with Black Hamburg rather small, clean Muscat of Alexandria, a good Queen Pine Apple, Best of All Melon, Royal George Peach, and Elruge Nectarine of fine quality. The Hon. C. H. Wynn was third with clean samples, amongst which there was a Pine Apple named "New Black Jamaica," which we recognised as our old friend Prince Albert. The Rev. J. D. Corbet was fourth with a very good Queen Pine, fine large Figs, and fair Muscat of Alexandria, but the Melon was past its best. The Misses Bannerman were placed first with nine dishes. The Muscat of Alexandria and Madresfield Court Grapes being very good, as were also the Peaches, Nectarines, Apricots, Cherries, Plums, Gooseberries, and Melon, which formed the other dishes. Colonel Wingfield was second and J. Watson, Esq., third, both being very close up to the first, the Muscat with the latter being very fine, but the Peaches and Nectarines were deficient.

The Peach class was well filled, the prizes going to Mr. W. Shaw, G. Meakin, Esq., and E. Wright, Esq. The Hon. C. H. Wynn was first for Nectarines, Sir C. R. Boughton second, F. H. B. Sladen, Esq., Leighton Hall (gardener, Mr. C. Davies), third, and General Jenkins, Cruckton Hall (gardener, Mr. J. Withers), fourth. Apricots were very good, Plums inferior and few, Melons plentiful, but not of general high quality, Sir V. R. Corbet taking first in the green-flesh variety class and G. Meakin, Esq., first in the scarlet-flesh variety class. Cherries were remarkably fine, the first prize being easily won by the Rev. R. E. Warren, The Mount, Shrewsbury, with a first-rate dish, as were also the second and third prize fruits from Sir P. Smythe, Acton Burnell (gardener, Mr. J. Edwards), and the Earl of Harrington. With six dishes of hardy fruit the Earl of Harrington was first, Mr. W. Shaw second, and J. Watson, Esq., third, the latter spoiling his chance for first place through introducing two dishes of Currants, the White inferior.

VEGETABLES.

The prizes for collections of twelve varieties produced keen competition, and although Colonel Wingfield's gardener, Mr. Lambert, was placed first there would have been no mistake made if Mr. Milner from Sundorne Castle had been placed equal, both showing uncommonly well. The former having Canadian Dwarf Beans, Major Clarke's red Celery, The Lyon Leek, very fine; Giant Cauliflower, too old; Tripoli Onion, Hathaway's Tomato, John Bull Pea, Brussels Sprouts, Telegraph Cucumber, Nutting's Beet, Covent Garden Perfection Potato, and James's Carrot. Mr. Milner's Perfection Tomato was

grand, as were also his Giant Cauliflower and Williams' red Celery, and, indeed, so were his other dishes, including Favourite Potato, Canadian Bean, Intermediate Carrot, Carter's Six Weeks' Turnip, Pragnell's Beet, Giant Rocca Onion, and Telegraph Cucumber. J. Watson, Esq., came third with well-grown produce, and this gentleman was first with six dishes of Potatoes, showing fine samples of Pride of the Valley, Woodstock Kidney, Blanchard, Vicar of Laleham, Webb's Surprise (one of the best), and Schoolmaster. General Jenkins came second, and these two exhibitors changed places in the three-dish competition. General Jenkins was first in the single-dish class with International. Tomatoes were numerous and fine; Peas were not in good form; Onions, spring and autumn sown, were abundant and good; Cucumbers, especially the first-prize brace from J. Watson, Esq., were capital; Cauliflowers were mostly too large and a little past their prime; Celery, French Beans, Parsnips, Carrots, and Turnips were extensively shown and good as a rule. Altogether local competitors in all departments are to be congratulated on being able to hold their own so well, as, although the handsome prizes offered bring many weighty opponents from a distance, the local growers certainly secure the lion's share of the prizes, and if they continue to improve as they have done in recent years it will soon be a hard matter to match them in any of the classes.

The cottagers had a tent 150 feet in length and 50 feet in width all to themselves. Someone suggested that the Potatoes exhibited in some instances had been dressed with furniture polish, but perhaps they had only accidentally come in contact with the beeswax in the honey tent close by. The vegetables in this section were certainly highly creditable to the growers, and so were the cut flowers and plants. The chief prizetakers were Messrs. George Roberts, Sundorne Lodge; W. Maund, Ludlow; Robert Gand, D. Hughes, Henry Jones, Market Drayton; Thomas Downes, W. Haycock, H. Clarke, M. Williams, and Mary Douglas.

MISCELLANEOUS EXHIBITS.

Messrs. Webb & Sons, seedsmen, of Wordsley, Stourbridge, had a large stand of vegetables, upwards of 100 varieties. They consisted of all the leading kinds for which this firm has become noted, and they were displayed in large heaps in a very attractive manner. The quality throughout was exceedingly fine, better indeed than could be found in the majority of the competing dishes, and being near the entrance to one of the principal tents it commanded much attention. A special first-class certificate of merit was awarded for this excellent collection, and if a higher award had been at the command of the Judges it would no doubt have received it. Mr. T. Laxton, Bedford, exhibited a fine stand of summer-flowering Chrysanthemums, Potatoes, Onions, Peas, and Kidney Beans of good quality, the whole of which was very highly commended. Messrs. James Dickson & Sons, Chester, had a fine collection of Conifers in pots near to the main entrance, and with these were many fine Liliums. Some admirable specimen Vines in pots were also shown by this firm, and inside one of the tents they had some good stands of Rose blooms, single Dahlias, and hardy flowers. Messrs. Richard Smith and Co., Worcester, filled a large table with Ferns, Palms, Crotons, Aralias, Heaths, and Caladiums; the whole edged with *Eunonymus albo-marginatus*. This was a most attractive table. The cut herbaceous flowers from this firm were exceedingly fine, as were also the Yuccas and Rose blooms. Messrs. F. & A. Dickson, Chester, filled a large stand with many excellent stove and greenhouse plants, as did also Messrs. Pritchard & Sons, Messrs. Jones & Sons, and Mr. Myers of the Sutton Lane Nurseries, Shrewsbury. Mr. Vertegans, nurseryman, Birmingham, exhibited largely and attractively his cut hardy flowers, seedling Carnations, Hollyhocks, Tuberoses, and Gaillardias being excellent in quality and beautifully set up. Outside "The Simplex" pot washer from Mr. E. Bennett was on view, and Messrs. Balfour from Longton had a good display of fancy and useful pots.

Messrs. Webb & Sons received a first-class certificate for a new unnamed seedling Potato. It has a rough brown coat, shallow eye, and appears both good and distinct. Mr. Laxton received the same compliment for his new White Beauty of Hebron Potato, which was shown cooked and uncooked, and a like distinction was bestowed on his White Czar runner Bean, which is out of the common in size.

SIDE-SADDLE FLOWERS.

UNDER the general term of Pitcher Plants are included several very peculiar and interesting groups of plants, of which the *Nepenthes* form the largest and most important genus; next to these come the *Sarracenia* and the strangely beautiful *Darlingtonia*. These are all distinguished by the remarkably singular structure of the leaves, which have departed from the ordinary form and apparently become more or less adapted for carnivorous habits similar to the Venus's Fly Trap *Dionaea muscipula*. In the *Nepenthes* the alteration is most completely effected, for of these the extremities of leaves assume a distinct pitcher-like form, the lower portion of the leaf-blade being of its normal character; in the *Sarracenia*, however, this is reversed, for in them it seems as if the leaf-stalk had been hollowed to constitute "the pitcher," while the blade takes the form of "a lid" at the apex, and this character also prevails in the *Darlingtonia*. As to the origin of these peculiarities opinions differ, and the plants are strangely isolated from their nearest relatives in leaf-form. So many links are wanting in the chain of evidence that we cannot satisfactorily trace the origin of the structure. That it has a use there can be little doubt, and, like the other "carnivorous plants," this seems to be mainly connected with the supply of nitrogenous nutriment to the plants through the medium of their leaves. Both *Sarracenia* and *Nepenthes* secrete a liquid which serves first to attract insects and then to kill them, and there are so many adaptations to this end that unquestionably the plants are intended to derive some advantage from it. The pitchers also serve another purpose. They in several cases act as reservoirs of moisture much in the same way as the closely imbricated leaves of the *Bromeliads*, or in a more remarkable degree in the "Traveller's Tree" of Madagascar. In some of the *Sarracenia*s, however, "the lid" is so closely placed or curved over the entrance to the leaf-tube that it is scarcely possible for rain to find an entrance, and a few of the *Nepenthes* are almost as effectually protected in a similar

manner. It is curious, too, that most of the carnivorous plants, including the *Sarracenias*, inhabit swamps where it might be supposed there would be less need of any additional means of support besides that furnished by the roots. These, however, are some of the problems of the plant world, very interesting to reflect upon but difficult or impossible to solve.

several other plants often widely separated as regards relationship the stigma assume a greatly enlarged form, and the true stigmatic surface is confined to small lines or points on the under side. This form is very strongly marked in the *Sarracenias*, the five large lobes being strongly curved downwards, and affording a puzzling structure to beginners in

Fig. 34.—SIDE-SADDLE FLOWERS—*S. Patersoni*, *S. flava maxima*, *S. Drummondii*.

The Side-saddle Flowers, as the *Sarracenias* are popularly known both here and in North America, have derived their title from another peculiarity, but for this we must look to the flowers. In the Irises and

botany. To the imagination of the early settlers in America these lobes were suggestive of the pommels of a side saddle, especially when the flowers are hanging slightly downwards, as in the usual position, with

drooping petals between the lobes, which an old writer says, was "supposed to resemble the position of a woman's leg when sitting on a side saddle." The origin of the generic name is less fanciful, and has nothing to do with the Sarracens as some might suppose, but simply commemorates the name of a French physician, Dr. Sarrazin of Quebec, and was bestowed upon these plants by the botanist Tournefort.

It has already been incidentally remarked that Sarracénias are inhabitants of swamps and similar situations in North America, and some idea can be formed from this as to the method of culture most likely to be successful. They are indeed easily cultivated, but there is considerable difference in the way their respective characters and attractions are developed, for when in their best condition they are extremely ornamental plants both for their pitchers and their flowers, but when badly treated they are not likely to attract much admiration, for they then have a miserable appearance. Mistakes are sometimes made in growing these plants by keeping them in too high a temperature, and this leads to failure as much as anything, for it should be remembered that except during active growth the plants thrive much better in a cool temperature. At Kew Sarracénias have been very successfully grown for some years, and there the position chosen for them during the summer months is the porch of the cool Orchid house, where, in company with *Pinguiculas*, *Dionæas*, and *Droseras*, they thrive most satisfactorily, producing large and finely coloured pitchers. Liberal supplies of water is another point requiring careful attention, and even during the winter they must never be allowed to become thoroughly dry, while in hot weather syringing amongst the plants (but very lightly on the pitchers) is necessary to preserve a constant moisture. In the following note from Dr. Alexander Paterson, Fernfield, Bridge of Allan, whose fine hybrid is shown in fig. 33, page 181, and who succeeds as well with these plants as he does with his Orchids, all the essential points in the culture of Sarracénias are summed up.

"As to the treatment adopted in the culture of Sarracénias, I find the best way to grow them is to imitate their native climate as much as possible. During the winter, when they are at rest, keep them cool; in the early spring, when they begin to start, they should be repotted in good fibrous peat and turf with some fresh living sphagnum, powdered sheep's droppings, and horn shavings. Top-dress with chopped living sphagnum, and put them into a warm Orchid house or stove, where they will grow with vigour. To increase the number and size of the pitchers pinch off all flowers as they appear, and whenever the pitchers are fully developed remove the plants to a cooler house without any shade, as the sunlight develops the rich colour some of them have. By the first week of June they should be placed out of doors, exposed to the full blaze of the sun. As a bedding plant (the pots being plunged) nothing could be more interesting than a clump or bed of these interesting and curious plants. All the care they want is to be well supported by stakes and plenty of water. In autumn, before frost sets in, remove them indoors to their winter quarters, a cool greenhouse."

It should be remembered, in regard to the latter portion of Dr. Paterson's note, that Bridge of Allan is a favoured spot; yet there is no doubt that many of the plants could be treated as he suggests. Certainly, the old *S. purpurea* is frequently grown out of doors on rockeries all the winter with very little protection, but it cannot be said that it looks happy in the majority of cases, and all are safest and colour best in a cool house.

The number of species of Sarracénias is not large, but in recent years very numerous and handsome hybrids have been raised, which comprise some of the most ornamental forms in cultivation, though in a few cases there is a strong family likeness which renders them rather difficult to distinguish. This is probably owing to the fact that it was found the plants grew very readily with each other, and in consequence many forms have been obtained, showing all intermediate gradations of character. It is probable also that some of those which have been sent out as introductions are natural hybrids.

SPECIES AND VARIETIES OF SARRACENIAS.

Those usually regarded as species, or at least as introduced forms of which the parentage is unknown, are as follows:—

S. ATROSANGUINEA.—An introduction from North America, sent out by Mr. Bull in 1880. In a young state the lid of the pitchers is green with red veins, but as they become older and larger the colour deepens to an intensely rich red hue with a glossy surface.

S. CRISPATA.—Very attractive. The pitchers and lids green, but the latter are beautifully veined with red in bold and regular lines. This is one of Mr. Bull's introductions, and was described in his catalogue for 1880.

S. DRUMMONDI.—A very handsome plant with tall pitchers, bright green at the lower part, beautifully mottled with white and veined with bright red at the upper part and in the lid, the flowers being purple. This has been freely used in hybridising with good results, as it is a free-growing and really fine species. It inhabits swamps in Florida, whence it was introduced rather more than half a century ago. A plant is shown in fig. 34.

S. ERYTHROPUS.—Remarkable for the deep red lids with which the neatly formed pitchers are furnished. It is another of Mr. Bull's plants, and was certificated by the Royal Botanic Society in 1881.

S. FILDESI.—A bold and handsome plant, the pitchers large and somewhat trumpet-shaped, green veined with purple. Sent out by Mr. B. S. Williams in 1881.

S. FLAVA.—The original form of this, that figured in the "Botanical Magazine," t. 780, at the commencement of the present century, is much

less attractive than the varieties that have subsequently been obtained. It has narrow, straight, plain green pitchers, and medium-sized yellow flowers, and had then been known in gardens as a curiosity for several years.

S. FLAVA LIMBATA.—A pretty variety, with the lid of the pitcher distinctly margined with red. Certificated by the Royal Botanic Society in 1881.

S. FLAVA MAXIMA.—Much superior to the ordinary form both in size and general beauty, the pitchers being very large, of a clear light green colour, and with large bright yellow flowers. It is a handsome companion for the dark-flowered Sarracénias. The light flower in fig. 34 is one of this variety grown by Dr. Paterson.

S. FLAVA VAR. ORNATA.—Distinguished by its bright green pitchers being closely netted with veins of a purplish hue, an extremely pretty contrast to the other forms of the species.

S. FLAVA PICTA.—This and the preceding are somewhat alike, the light green pitchers being beautifully veined with crimson at the upper part.

S. MINOR.—A diminutive form which has been confounded with *S. variolaris*, but quite distinct as represented in Sweet's "Flower Garden," New Series, p. 138. It has plain green straight pitchers and purple flowers, and is said to be a native of Georgia.

S. PORPHYRONEURA.—A neat dwarf form, the pitchers of medium size, with round lids, green veined with purple. Certificated at Regent's Park in 1882. One of Messrs. J. Veitch & Sons' additions to the genus.

S. PSITTACINA.—The Parrot's-head Sarracenia is very pretty and distinct, its small pitchers having a curiously curved lid or apex, purple or crimson, handsomely mottled with white. Introduced from Florida, 1866.

S. PURPUREA.—Though not one of the most beautiful, this is interesting as being the first species introduced to England, having been imported by the younger Tradescant before 1640. The pitchers are green and red, the flowers purplish.

S. RUBRA.—In this the lid is more acute or ovate than in most of the larger forms, and is green veined with red, the flowers being of a very rich red hue.

S. VARIOLARIS.—A distinct form with narrow pitchers, the small lid being curved closely downwards, spotted with white and having a few red veins. The flowers differ from the others in the shorter greenish petals spreading instead of drooping.

HYBRID SARRACENIAS.

The best of the hybrids are as follows, the name given after each being that of the raiser or firm which sent it out in England, and the date, except where otherwise stated, indicates the year when it first appeared in the catalogues.

S. ATKINSONIANA (Bull).—A hybrid from *S. purpurea* and *S. flava maxima*, much resembling the latter.

S. CHELSONI (Veitch, 1879).—A beautiful hybrid between *S. rubra* and *S. purpurea*, raised by Messrs. Veitch & Sons, Chelsea, and especially interesting, as being the first of now numerous hybrids obtained artificially. In habit and form of the pitchers it is strikingly intermediate between the two parents, but it surpasses both in the rich crimson colour, and in this respect is one of the best of the cultivated forms.

S. COURTII (Veitch).—A very pretty and neat hybrid between *S. psittacina* and *S. purpurea*. The pitchers are deep red in colour, and form close tufts 4 to 5 inches across, and in some instances there are a dozen pitchers in that space. It is a curious and attractive form, evidently intermediate between the parents named, and partaking largely of the *S. psittacina* habit. It was certificated by the Royal Horticultural Society in 1881, and at the Regent's Park in 1882.

S. EXCELLENS, *S. EXCULTA*, AND *S. EXORNATA*.—All hybrids sent out by Mr. Bull. 1, From *S. variolaris* and *S. Drummondii alba*. 2, From *S. atropurpurea* and *S. crispata*. They are pretty, but not remarkably distinct.

S. FORMOSA (Bull).—A hybrid between *S. psittacina* and *S. variolaris*, and combines most of the attractive characters of each parent, being a dwarf, compact form, with prettily marked pitchers. A certificate was awarded for it at Manchester in 1881.

S. ILLUSTRATA AND *S. MADDISONIANA*.—1, From *S. flava picta* and *S. Stevensi*, quite of the flava style. 2, *S. variolaris* and *S. psittacina*, prettily mottled.

S. MELANORHODA (Veitch).—A hybrid between *S. purpurea* and *S. Stevensi*, with pitchers 6 to 8 inches long, of an extremely dark red colour, almost black in some cases. It is a very distinct form, and has been honoured by certificates both at Manchester and South Kensington in 1881, and at Regent's Park in 1882.

S. MITCHELLIANA (Williams).—A hybrid between *S. Drummondii rubra* and *S. purpurea*, the pitchers large and very handsome, the lid broad, undulated, and heavily veined with deep red. Certificated in 1884 at Regent's Park.

S. PATERSONI.—A hybrid between *S. purpurea* and *S. Drummondii*, raised at Fernfield by Dr. A. Paterson, Fernfield, Bridge of Allan, N.B., about ten years ago, and of which there are only nine plants in cultivation—one at Sandringham, one at Glasnevin, one at Edinburgh, and six in Dr. Paterson's possession, the plant exhibited at Kensington, August 11th, and then awarded a first-class certificate, being subsequently sent to the Royal Gardens, Kew. The pitchers are very strong, 12 to 18 inches high, proportionately broad, with a lid 4 inches in diameter and of a uniform rich dark red colour from the top to the base, the lids being veined on a slightly lighter ground colour. It is a very strong-growing handsome Sarracenia, and will take its place amongst the finest of those in cultivation. Fig. 33 represents a portion of one of the pitchers, and in fig. 34

the dark flower is one of this hybrid, which, together with the others, were sent by Dr. Paterson.

S. SWANNIANA (Bull).—A hybrid between *S. variolaris* and *S. purpurea*, with medium-sized pitchers of a deep red colour, the leaves broad and heavily veined with dark red. Certificated at South Kensington in 1883.

S. TOLLIANA (Williams).—A hybrid between *S. purpurea* and *S. flava*, the pitchers slender and elegant in form, bright green, with a broad lid veined with bright crimson. Certificated by the Royal Botanic Society in 1884.

S. WILSONIANA (Bull).—A hybrid between *S. purpurea* and *S. Drummondii rubra*, somewhat resembling *S. Swanniana* in form and size, but with bold crimson veins.

S. WRIGLEYANA (Veitch).—A hybrid from *S. psittacina* and *S. Drummondii rubra*, resembling the first named parent in habit, but rather stronger, the pitchers veined with red on a white or semi-transparent ground. An extremely handsome form. Certificated by the Royal Horticultural Society in 1884.—LEWIS CASTLE.

NOTES ON GRAPES.

GROS MAROC.—This Grape seems likely to come more into fashion as it becomes more generally known. It seems capable of being improved in flavour by grafting on the Black Hamburgh, which is a good thing, as on its own roots it is very much wanting in flavour. It appears to colour very well in comparatively little heat, takes on a fine bloom, makes a very pretty dish on a table or a basket for market, and if, as stated, grafting on the Hamburgh improves its flavour, may be called a fairly good Grape when its edible qualities are discussed.

It will no doubt prove useful as a Grape for consumption after Hamburghs are finished and before Colman is ready. In this particular it may be classed along with Alicante, which, though capable of being kept very late, has also the recommendation of being eatable before Colman. For grand appearance, however, no variety of black Grape can equal Gros Colman.

MUSCAT OF ALEXANDRIA.—This noble Grape—in some ways superior to all others—is often met with in circumstances which are adverse to the development of all its excellencies. Lately the writer was visiting a place where Alicante, Lady Downe's, and other varieties were growing side by side with Muscats, to the evident detriment of the latter. The house was being treated to abundance of air, and the temperature maintained was one which, though it seemed to suit Alicantes, &c., evidently did not suit the Muscats, as they were small in berry, very green, and looking quite like shanking considerably—indeed, compared with samples from another vinery where a Muscat temperature is maintained, those in the mixed house were very far from being fair examples of this grand Grape. All who can manage it should devote a house to Muscats; they will then be able to do justice to them, other conditions of successful culture of course being present, such as good borders and good management generally.—V.

BATTERSEA PARK.

IN addition to the rich collection of flowering trees and shrubs which this park contains, it possesses a totally distinct appearance from all other gardens provided for the benefit of the London public. Now that the trees and shrubs have attained a good size, this park has a natural and picturesque appearance. It is simply charming, and rendered so to a large extent by its undulating surfaces and well-kept winding walks, which have to be followed to discover its many attractions. The whole of the park cannot be seen at a glance, which makes it the more enjoyable. There can be no question about its beauty, independent of its many and varied floral decorations of both flowers and foliage during the summer months.

The well-shaped nooks and corners in this park are admirably suited for displaying to the best advantage the various hedding arrangements that may be carried out. These are extensive, and afford evidence of both intelligent thought and great artistic taste. Sub-tropical bedding is admirably represented, and in many instances the beds afford a pleasing relief and a splendid background to the carpet and flowering beds. Whatever skill might be employed, it would be utterly impossible to carry out sub-tropical gardening to produce the same effect on the level surface of the grounds at Hampton Court. Roses had been a fine feature at one of the entrances, the old Cabbage, common Moss, and such varieties that did well, being employed with Pentstemons and ribbon borders surrounding them. Ribbon borders are continued more or less until the lake and more undulated portions of the park are reached. There are, however, several breaks into the ribbon borders by suitable openings in the shrubbery, where a number of flower beds are tastefully arranged and filled with a mixed variety of flowering plants. These mixed beds are becoming very popular, and strikingly effective they are, yet the public do not appreciate them, or linger about them the same as they do round the beautiful carpet beds.

Upon reaching that portion of the grounds where the principal bedding is arranged, the first group that took my attention was composed of

Ailantus glandulosa, that is cut back annually and allowed to go away again with one shoot only. This handsome tree, used in this way, is one of the most beautiful foliage plants for the purpose. These were very strong, some of the leaves measuring no less than 4 feet 6 inches in length. These rose out of and towered considerably above a groundwork of Bamboos, while *Catalpa syriacifolia aurea*, with its golden foliage well coloured, stood out prominently in the front, the group being faced with a row of Pelargoniums and the old *Gazania splendens*. Near to and very effective was a large plant of *Polygonum sachalinense*, with its large bold foliage and white flowers. No other plant could have been more suitable for the position. *P. Sieboldi* and *P. cuspidatum crispulum* I also noticed was employed in other prominent places in connection with Palms and foliage plants. *Aralia Sieboldi* was rising from a groundwork of flowering plants, and *Araucaria excelsa*, a good-sized plant, with its branches overhanging silver-leaved Pelargoniums. *Convolvulus mauritanicus* formed a charming edging to another group, and was most striking with thousands of its pretty blue flowers. Behind this was a fine row of pink Pelargonium *Cleopatra*, with a mass of a yellow-flowering *Canna* just coming into bloom, and backed by dark-foliaged shrubs. A bed of *Wigandia caracasana*, with its noble foliage, was very noticeable rising from a mixed groundwork of *Gnaphalium*, *Ageratum*, and *Scabious*, with a few *Gladioli*. The edging to this bed consisted of a ring of Pelargonium *Crystal Palace Gem*, *P. Manglesi variegatum*, and *Lobelia alternately*. Another really charming sub-tropical bed was composed of *Aralia papyrifera*, mixed with variegated *Maize* rising from an undergrowth of *Lantanas*, and edged with Pelargonium *Vanessa*, rosy salmon in colour and a most beautiful free-flowering hedder. *Tropæolum Bedford Rival* formed the margin, and was covered with hundreds of its bright scarlet flowers. This variety, from its dwarf, compact, free-flowering nature, is evidently well adapted for hedding. Amongst a groundwork of *Marguerites*, *Petunias*, and *Ageratum*, *Eucalyptus globulus* rising considerably above them was very attractive; the remaining portion of the bed being completed with *Cannas*, Pelargoniums, and *Gazania splendens*. Another simple yet striking arrangement was produced by *Acacia lophantha*, springing from an undergrowth of *Centaurea candidissima*, surrounded with a band of *Amaranthus melanocephalus ruber*, edged with *Lobelia* and *Achillea umbellata*, its silvery Fern-like foliage contrasting admirably with the grass.

What are known as the great S shaped beds are next reached, and the contrast between the style of hedding adopted was all that could be desired. Small variegated *Yuccas* were rising from a groundwork of *Mentha Pulegium gibraltarica*, handed with *Euonymus radicans variegata* and Golden Nugget Pelargonium. *Colcus* and *Dactylis glomerata longissima* were in association, the ground being carpeted with *Lobelia* and *Alyssum*, the bed being edged with *Alternanthera*, *Pyrethrum*, and the *Euonymus* named above. Near to it was a large *Phoenix reclinata*, with a carpet beneath of *Coleus*, with bands of Pelargonium *Surprise* and Golden Fleece, *Echeveria glauca metallica* forming the edging next to the grass. Close to, and strikingly conspicuous, was *Solanum macrophyllum*, with *Lobelia cardinalis* and *Agapanthus umbellatus* in flower, the spaces between being filled in with *Heliotrope*. These were encircled by a row of silver-leaved Pelargonium, with *Lobelia* next, and *Veronica Andersoni variegata* pegged neatly down next to the grass. At one of the windings of the walk where the shrubs reached nearly to the margin a very pretty arrangement of mixed plants again arrested attention. *Hyacinthus candicans* and *Nicotiana affinis* were most noteworthy, with their white flowers rising above plants of a somewhat lower growth, *Calceolarias*, and even the old *Fuchsia fulgens*, was not despised, while *Tigridias* were just coming into flower, and in a very short time would be truly gorgeous, this interesting group being edged with two or three rows of flowering and foliage plants very similar to other beds detailed. Very gay and attractive amongst this wealth of foliage and flowers was a circular bed of Pelargonium *Mrs. Ware*, pink, banded with a variegated variety, and edged with *Lobelia*.

The scene was again changed by a large mass of Bamboos, surrounded on the front side with *Funkias* in flower, while the shrubs formed a capital background. Every winding in the walk brought into view some telling arrangement, and one of the very finest had been obtained by a large bed of *Abutilon braziliense*, planted alternately with *Veronica Andersoni variegata* and *Iresine Lindenii*, handed with *Alyssum saxatile variegata*, edged with *Lobelia Omen*, and margined with a small *Echeveria*.

A beautiful carpet bed was arranged in a lovely spot surrounded by beds of *Cannas*, flowers and foliage, with Palms and other stately plants amongst them in suitable and telling positions. With such surroundings the beauty of carpet beds are really delightful. The bed to which reference has been made had for its centre a diamond-shaped figure of *Alternanthera amabilis*; central circles were formed by *Diotis candidissima*, carpeted with *Mentha* and panelled with *Veronica incana*. Three concentric bands of *Pyrethrum* enclosed with *Alternanthera paronychioides* major and *Leucophyton Brownii*, with circular and diamond patches of *Alternanthera amœna*, the whole being margined with *Antennaria tomentosa*, and edged with *Sedum acre elegans*. Between this and the next carpet bed was a telling mixture at the front of the shrubs, the back being scarlet single Dahlias with *Lobelia fulgens* in front, margined with a very fine row of Pelargonium *John Gibbons*, which appears a great favourite in this park, and edged with *Saxifraga ligulata*. The carpet bed to be detailed was an oblong in shape with three circles down the centre, the central one being planted with *Pandanus Veitchii*, and the two end ones with *Dracæna gracilis*, with a carpet beneath of *Pilea muscosa*, edged with Pelargonium *Manglesi variegatum*, with panels of *Iresine*

Lindeni and *Alternanthera aurea*. *Leucophyton Browni* and *Kleinia repens*, narrow rows, were arranged between two bands of *Alternanthera amoena*, edged with *Sempervivum tabulaforme* and *Herniaria glabra*. This was a charming bed. Behind it was a very suitable and telling background of stately plants of *Brugmansia Knighti* in full bloom, with single Dahlias beneath them, *Pentstemons* and *Pelargoniums* in the front, with a margin of *Pelargonium tomentosum* (peppermint-scented variety). A bed of the variegated Vine (*Vitis heterophylla variegata*) was very beautiful, being well-coloured, with *Acacia lophantha* rising from amongst it, banded with a ring of *Lonicera aurea reticulata*, variegated *Arabis*, *Alternanthera*, and *Spergula pilifera aurea*. *Pelargonium Mrs. Turner* made a pretty bed, and was full of bloom of a rich pink colour, edged with *Miss Kingsbury* and *Lobelia*.

Very effective was another carpet bed in front of a splendid mass of dark-foliaged *Cannas*. The central plant of the carpet bed was *Chamaepeuce diacantha*, surrounded with *Alternanthera magnifica* and *Mesembryanthemum cordifolium variegatum*, dotted with *Rochea falcata*, half-circular figures being formed of *Alternanthera amoena*, edged with *Echeveria secunda glauca* and *Sedum acre elegans*. *Convolvulus mauritanicus* was again most conspicuous, forming an edging to single *Petunias* and a splendid mass of *Erythrina crista-galli* in full beauty. A large square bed was the next notable feature, with raised cushions of *Mentha* dotted with fine *Yuccas*, the centre one being variegated, alternately with *Dracena congesta* and *D. gracilis*, edged with *Kleinia repens*. Small cushions were also formed in the angles with *Sedum glaucum*, each containing three plants of *Echeveria glauca metallica*, edged with *Leucophyton Browni*, the groundwork of the bed being formed of *Sedum glaucum* margined with *Lobelia pumila*, and edged with *Sempervivum tabulaforme* and *Herniaria glabra*.

Under a large Willow tree a very natural arrangement had been effected with *Philodendron protusum* trained up the stem, probably more beautiful than it would appear in its natural habitat. Beneath the tree in the grass was the old *Sansevieria zealanica* with large succulents and Palms, such as *Seaforthia elegans*, peeping out in the background. Close to was a striking mass of *Acer Negundo variegata* that was shown to great advantage by the surrounding dark foliage. The *Acers* were small standards, their legs being hid from view by *Carnations* tied to them, many of which were in bloom, but the dry weather had told upon them considerably. *Pelargonium Mrs. Pollock*, mixed with *Agatheae celestis*, with its blue *Cineraria*-like flowers, edged with *Lobelia*, made a simple yet very effective bed.

The coffin-shaped beds, as they are termed, were really perfect examples of carpet bedding, having most beautifully shaped designs, with different varieties of *Alternantheras* margined with *Kleinia repens*, with scrolls of *Leucophyton Browni* intersected with *Mesembryanthemum cordifolium variegatum*, margined with *Alternanthera amoena* 4 inches wide, and edged with *Echeveria secunda glauca*, *Kleinia repens* running through the whole design. The other bed of the same shape was equally beautiful, having *Mesembryanthemum* in the place of *Leucophyton Browni*, and *Mentha* in the place of the first mentioned, the *Alternantheras* used being darker varieties. Another distinct and striking bed was arranged with large plants of *Bonaparteia gracilis* and *B. tenuifolia* with their long narrow rush-like leaves, a plant of the latter producing its enormous spike of bloom, each plant being surrounded with a row of a Golden-leaved *Pelargonium*, the ground of the bed filled with a blue *Lobelia* and *Alyssum saxatile variegatum*, a band of *Alternantheras* encircled the whole, while the edging was composed of *Sempervivum ciliare*. A very imposing group was formed with dark-foliaged Castor Oil Plants (*Ricinus*), with *Heliotrope* in full beauty beneath, bronze *Pelargoniums* and *Euonymus radicans variegata* forming an edging to the bed.

The scroll beds were very well carpeted, being planted with *Alternantheras*; between single lines of *Pyrethrum* and *Kleinia repens* were *Alternanthera amoena*, *A. versicolor*, *A. aurea*, and *Leucophyton Browni*, the groundwork being composed of *Mentha*, and the bed margined with *Lobelia*, *Echeveria*, and *Sedum*. This was really a charming bed, and displayed that high finish which renders the appearance of these beds so delightful. Another bed no less beautiful had the ground carpeted with *Sedum acre elegans*, panelled with *Leucophyton Browni* and *Alternantheras* between narrow rows of *Pyrethrum*, *Leucophyton*, and *Kleinias*; circular pieces of *Rochea falcata* were conspicuous with *Coprosma Baueriana variegata* in the angles being very dwarf and effective. The edging was similar to that named in the previous bed; the artistic scrolls in these beds being really past description. A simple, yet very pretty carpet bed, was effected by *Rochea falcata* in half-circular figures, *Iresine Lindeni* and *Centaurea candidissima* being also prominent in various shaped figures, with a groundwork of *Mesembryanthemum cordifolium variegatum*, *Mentha*, and *Alternanthera*. In a very suitable position close to what may be termed the alpine garden, was a very effective group of *Acanthus longifolius* with its large spikes of white flowers and leathery, bright, deeply cut foliage. The alpine portion was very effective, with pointed mounds made to represent hills in the background, their summits covered with the silvery foliage of *Antennaria tomentosa*, while *Mesembryanthemums* in great variety, *Yuccas*, various succulents, and other suitable low-growing plants were established on the slopes, the ground beneath them being carpeted with *Sedums*, *Mentha*, *Herniaria glabra*, and other similar small-growing plants. This was a pretty interesting corner, and a beautiful change from the large quantities of fine-foliage and flowering plants to be seen elsewhere, the most conspicuous of which have been noted above.

Last, but not least in importance, are the lovely, natural, cool shady groves of hardy and exotic Ferns that are so tastefully arranged. These Fern groves are charming, and I do not hesitate in saying that such

another piece of outdoor decoration equal to this cannot be found in this country. Many of us have doubtless seen most beautiful masses of Ferns growing luxuriantly where Nature has placed them, but they have been less effective than the group under notice, because the surroundings have not been such as to show them off to the very best advantage. The Fern groves are beautiful, and it is very difficult to fully describe them, for to really appreciate them they must be seen.

I wandered from this Park by the river entrance, where the cornice style of bedding had been adopted, but I shall not stay to describe it. Before closing, however, I must here thank Mr. Rodger for his kind attention and courtesy, and must congratulate him and his able foreman upon their success, for I do not remember ever seeing this Park in such admirable condition before.—B.

DEVON AND EXETER HORTICULTURAL SOCIETY.

AUGUST 21st.

THE above Society held its annual summer Show of plants and flowers, fruits, and vegetables on Friday last, under favourable circumstances as regards the weather, number and quality of the exhibits staged, not forgetting the financial proceeds of the day, so that on the whole the Exhibition may be pronounced a decided improvement upon any of its immediate predecessors. Plants were shown largely and well. Mr. Lock, who had done so well at Weston, Taunton, and Salisbury, secured the silver cup for ten stove or greenhouse plants in flower, with plants similar to those enumerated in our reports of the shows indicated. The same exhibitor was also first in most of the leading classes for fine-foliage, stove and greenhouse plants. Following him in the same classes were Mr. Brock and Mrs. Ensor's gardener, whose name did not appear. Mr. A. Truman and Mrs. Panget's gardener were also successful exhibitors in classes for Ferns, &c.

The large marquee in which the plants were arranged was rendered very effective by several tastefully set up groups of miscellaneous plants, for the best of which a silver cup was offered, and which was secured by Mr. Brock for an excellent arrangement of suitable plants covering a stage 25 feet by 5 feet. Mr. Lock was a good second. Lord Fielding's gardener was first for six Fuchsias and twelve Gloxinias, &c. Lord Coleridge's gardener showed some good Cockscombs. Mr. Brock was first for six Orchids. Mrs. Ensor was first for a group—an excellent one, too—of miscellaneous plants arranged on a stage 15 feet by 5 feet. Cut flowers were shown well—that is, Roses and Dahlias, and *Gladiolus*, by Messrs. Curtis, Sanford & Co., Mr. Nation, Rev. T. J. Yarde, Mr. S. Dobree, Captain Christy, who had the best twelve Roses distinct. Asters were shown well for the season by Mrs. Hart, Mr. Drew, and also by Mr. Nation, who also had the best Dahlias in the Show.
